MEA Aeroskills Training Package

Release: 1.4

CONTENTS

MEA Aeroskills Training Package	26
MEA20415 Certificate II in Aeroskills.....	27
MEA20515 Certificate II in Aircraft Line Maintenance	31
MEA20615 Certificate II in Aircraft Surface Finishing.....	35
MEA30115 Certificate III in Aircraft Surface Finishing.....	38
MEA30215 Certificate III in Aeroskills (Mechatronics)	41
MEA30315 Certificate III in Aircraft Life Support and Furnishing.....	47
MEA40615 Certificate IV in Aeroskills (Avionics).....	53
MEA40715 Certificate IV in Aeroskills (Mechanical).....	63
MEA40915 Certificate IV in Aircraft Surface Finishing.....	72
MEA41015 Certificate IV in Aeroskills (Mechatronics).....	76
MEA41115 Certificate IV in Aircraft Life Support and Furnishing.....	89
MEA41215 Certificate IV in Aeroskills (Armament).....	96
MEA41315 Certificate IV in Aeroskills (Structures).....	100
MEA50115 Diploma of Aeroskills (Avionics).....	104
MEA50215 Diploma of Aeroskills (Mechanical)	109
MEA50315 Diploma of Aviation Maintenance Management (Avionics)	116
MEA50415 Diploma of Aviation Maintenance Management (Mechanical).....	119
MEA50515 Diploma of Aeroskills (Non-Destructive Testing).....	122
MEA50615 Diploma of Aeronautical Engineering.....	128
MEA50715 Diploma of Avionic Engineering	132
MEA60115 Advanced Diploma of Aviation Maintenance Management (Avionics).....	136
MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical)	141
MEA60315 Advanced Diploma of Aviation Non-Destructive Testing.....	146
MEA60415 Advanced Diploma of Aeronautical Engineering	153
MEA60515 Advanced Diploma of Avionic Engineering.....	159
AURVTP2003 Prepare spray painting materials and equipment.....	164
AURVTP3012 Apply air dry and polyurethane enamel refinishing materials	173
AURVTT2004 Trim vehicle components	182
AURVTT2005 Select and apply trim and fabric materials	192
AURVTT2006 Select and apply trim and fabric adhesives.....	200
AVIF3016A Marshal aircraft	209
DEFEO101D Work safely with explosive ordnance	217
DEFEO301D Package ammunition.....	223
DEFEO302D Unpackage ammunition.....	229
DEFEO501D Conduct explosive ordnance inspection.....	234
DEFEO718C Maintain cartridge operated fire extinguisher systems	239
LMTTF2008A Use adhesives.....	244
MEA101 Interpret work health and safety practices in aviation maintenance	250
Assessment Requirements for MEA101 Interpret work health and safety practices in aviation maintenance	254
MEA103 Plan and organise aviation maintenance work activities	257
Assessment Requirements for MEA103 Plan and organise aviation maintenance work activities.....	260
MEA105 Apply quality standards applicable to aviation maintenance	262
Assessment Requirements for MEA105 Apply quality standards applicable to aviation maintenance.....	265
MEA107 Interpret and use aviation maintenance industry manuals and specifications..	267

Assessment Requirements for MEA107 Interpret and use aviation maintenance industry manuals and specifications.....	270
MEA108 Complete aviation maintenance industry documentation	272
Assessment Requirements for MEA108 Complete aviation maintenance industry documentation.....	275
MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance.....	277
Assessment Requirements for MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	280
MEA111 Perform administrative processes to prepare for certification of civil aircraft maintenance.....	283
Assessment Requirements for MEA111 Perform administrative processes to prepare for certification of civil aircraft maintenance	287
MEA112 Plan and implement civil aircraft maintenance activities.....	289
Assessment Requirements for MEA112 Plan and implement civil aircraft maintenance activities.....	293
MEA113 Supervise civil aircraft maintenance activities and manage human resources in the workplace.....	296
Assessment Requirements for MEA113 Supervise civil aircraft maintenance activities and manage human resources in the workplace.....	301
MEA114 Certify aeronautical product maintenance	305
Assessment Requirements for MEA114 Certify aeronautical product maintenance	308
MEA115 Plan and implement aeronautical product maintenance activities	311
Assessment Requirements for MEA115 Plan and implement aeronautical product maintenance activities.....	315
MEA116 Apply work health and safety procedures at supervisor level in aviation maintenance.....	317
Assessment Requirements for MEA116 Apply work health and safety procedures at supervisor level in aviation maintenance.....	323
MEA117 Apply self in the aviation maintenance environment	325
Assessment Requirements for MEA117 Apply self in the aviation maintenance environment.....	328
MEA118 Conduct self in the aviation maintenance environment.....	330
Assessment Requirements for MEA118 Conduct self in the aviation maintenance environment.....	333
MEA119 Perform administrative processes to prepare for certification of civil aircraft A level line maintenance.....	335
Assessment Requirements for MEA119 Perform administrative processes to prepare for certification of civil aircraft A level line maintenance	338
MEA120 Manage an aviation maintenance quality system.....	340
Assessment Requirements for MEA120 Manage an aviation maintenance quality system.....	343
MEA121 Manage aircraft/aeronautical product configuration.....	345
Assessment Requirements for MEA121 Manage aircraft/aeronautical product configuration	349
MEA122 Manage aircraft/equipment system performance testing.....	351
Assessment Requirements for MEA122 Manage aircraft/equipment system performance testing	354
MEA123 Manage aviation maintenance work environment policy and practices	356
Assessment Requirements for MEA123 Manage aviation maintenance work environment policy and practices	360
MEA124 Coordinate change programs in the aviation maintenance environment	362
Assessment Requirements for MEA124 Coordinate change programs in the aviation maintenance environment.....	366

MEA125 Develop aviation maintenance personnel.....	368
Assessment Requirements for MEA125 Develop aviation maintenance personnel.....	372
MEA126 Manage aircraft maintenance activities.....	374
Assessment Requirements for MEA126 Manage aircraft maintenance activities.....	378
MEA127 Provide technical advice in the maintenance and management of aircraft and aeronautical product.....	380
Assessment Requirements for MEA127 Provide technical advice in the maintenance and management of aircraft and aeronautical product.....	385
MEA128 Provide engineering advice in the modification, maintenance and management of aircraft systems.....	387
Assessment Requirements for MEA128 Provide engineering advice in the modification, maintenance and management of aircraft systems.....	390
MEA129 Investigate technical aspects of aviation occurrences.....	392
Assessment Requirements for MEA129 Investigate technical aspects of aviation occurrences.....	395
MEA130 Manage deployed/detached aviation maintenance activities.....	397
Assessment Requirements for MEA130 Manage deployed/detached aviation maintenance activities.....	401
MEA131 Manage the custody, transfer and disposal of aircraft, aeronautical product and support equipment.....	403
Assessment Requirements for MEA131 Manage the custody, transfer and disposal of aircraft, aeronautical product and support equipment.....	406
MEA132 Manage budgetary resources in the aviation maintenance environment.....	408
Assessment Requirements for MEA132 Manage budgetary resources in the aviation maintenance environment.....	411
MEA133 Communicate aviation technical and maintenance management knowledge ...	413
Assessment Requirements for MEA133 Communicate aviation technical and maintenance management knowledge.....	416
MEA134 Establish, maintain and evaluate the organisation's work health and safety system.....	418
Assessment Requirements for MEA134 Establish, maintain and evaluate the organisation's work health and safety system.....	425
MEA135 Use computers in aviation maintenance-related integrated logistic support activities.....	427
Assessment Requirements for MEA135 Use computers in aviation maintenance-related integrated logistic support activities.....	431
MEA136 Assess aviation maintenance spares and manage repairable items.....	433
Assessment Requirements for MEA136 Assess aviation maintenance spares and manage repairable items.....	437
MEA137 Write aviation technical publications.....	439
Assessment Requirements for MEA137 Write aviation technical publications.....	442
MEA138 Perform aviation technical publication management activities.....	445
Assessment Requirements for MEA138 Perform aviation technical publication management activities.....	448
MEA139 Perform aviation maintenance-related integrated logistic support management activities.....	450
Assessment Requirements for MEA139 Perform aviation maintenance-related integrated logistic support management activities.....	453
MEA140 Supervise aviation maintenance teams and perform maintenance quality inspections.....	455
Assessment Requirements for MEA140 Supervise aviation maintenance teams and perform maintenance quality inspections.....	460
MEA141 Manage risk in aviation maintenance.....	462

Assessment Requirements for MEA141 Manage risk in aviation maintenance	466
MEA142 Manage self in the aviation maintenance environment	468
Assessment Requirements for MEA142 Manage self in the aviation maintenance environment.....	472
MEA143 Develop and manage maintenance error management programs	474
Assessment Requirements for MEA143 Develop and manage maintenance error management programs	477
MEA145 Conversion from allied trades for employment in aviation maintenance workshops.....	479
Assessment Requirements for MEA145 Conversion from allied trades for employment in aviation maintenance workshops	483
MEA146 Prepare and manage aviation maintenance organisation budgets and financial plans	486
Assessment Requirements for MEA146 Prepare and manage aviation maintenance organisation budgets and financial plans	492
MEA147 Perform airworthiness management and maintenance program tasks	494
Assessment Requirements for MEA147 Perform airworthiness management and maintenance program tasks	498
MEA148 Apply mathematics and physics in aviation maintenance	500
Assessment Requirements for MEA148 Apply mathematics and physics in aviation maintenance.....	503
MEA201 Remove and install miscellaneous aircraft electrical hardware/components	506
Assessment Requirements for MEA201 Remove and install miscellaneous aircraft electrical hardware/components	509
MEA202 Remove and install basic aircraft electrical system components	511
Assessment Requirements for MEA202 Remove and install basic aircraft electrical system components.....	514
MEA203 Remove and install advanced aircraft electrical system components	517
Assessment Requirements for MEA203 Remove and install advanced aircraft electrical system components	520
MEA204 Remove and install basic aircraft instrument system components	524
Assessment Requirements for MEA204 Remove and install basic aircraft instrument system components	527
MEA205 Remove and install advanced aircraft instrument system components	531
Assessment Requirements for MEA205 Remove and install advanced aircraft instrument system components	534
MEA206 Remove and install aircraft basic radio communication and navigation system components.....	538
Assessment Requirements for MEA206 Remove and install aircraft basic radio communication and navigation system components.....	541
MEA207 Remove and install aircraft electronic system components	544
Assessment Requirements for MEA207 Remove and install aircraft electronic system components.....	547
MEA208 Remove and install aircraft pressurisation control system components	550
Assessment Requirements for MEA208 Remove and install aircraft pressurisation control system components	553
MEA209 Remove and install aircraft oxygen system components	555
Assessment Requirements for MEA209 Remove and install aircraft oxygen system components.....	558
MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components	560
Assessment Requirements for MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components	563

ME A211 Inspect, test and troubleshoot advanced aircraft electrical systems and components.....	567
Assessment Requirements for ME A211 Inspect, test and troubleshoot advanced aircraft electrical systems and components.....	571
ME A212 Inspect, test and troubleshoot basic aircraft instrument systems and components.....	575
Assessment Requirements for ME A212 Inspect, test and troubleshoot basic aircraft instrument systems and components.....	579
ME A213 Inspect, test and troubleshoot advanced aircraft instrument systems and components.....	583
Assessment Requirements for ME A213 Inspect, test and troubleshoot advanced aircraft instrument systems and components.....	587
ME A214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components.....	591
Assessment Requirements for ME A214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components.....	594
ME A215 Inspect, test and troubleshoot advanced aircraft communications systems and components.....	597
Assessment Requirements for ME A215 Inspect, test and troubleshoot advanced aircraft communications systems and components.....	600
ME A216 Inspect, test and troubleshoot instrument landing systems and components.....	603
Assessment Requirements for ME A216 Inspect, test and troubleshoot instrument landing systems and components.....	606
ME A217 Inspect, test and troubleshoot fixed wing autopilot systems and components.....	608
Assessment Requirements for ME A217 Inspect, test and troubleshoot fixed wing autopilot systems and components.....	611
ME A218 Inspect, test and troubleshoot rotary wing autopilot systems and components.....	614
Assessment Requirements for ME A218 Inspect, test and troubleshoot rotary wing autopilot systems and components.....	617
ME A219 Inspect, test and troubleshoot aircraft pressurisation control systems and components.....	620
Assessment Requirements for ME A219 Inspect, test and troubleshoot aircraft pressurisation control systems and components.....	623
ME A220 Inspect, test and troubleshoot aircraft primary radar systems and components.....	626
Assessment Requirements for ME A220 Inspect, test and troubleshoot aircraft primary radar systems and components.....	629
ME A221 Inspect, test and troubleshoot aircraft secondary radar systems and components.....	631
Assessment Requirements for ME A221 Inspect, test and troubleshoot aircraft secondary radar systems and components.....	634
ME A222 Inspect, test and troubleshoot aircraft oxygen systems and components.....	637
Assessment Requirements for ME A222 Inspect, test and troubleshoot aircraft oxygen systems and components.....	640
ME A223 Inspect aircraft electrical systems and components.....	643
Assessment Requirements for ME A223 Inspect aircraft electrical systems and components.....	646
ME A224 Inspect aircraft instrument systems and components.....	649
Assessment Requirements for ME A224 Inspect aircraft instrument systems and components.....	652
ME A225 Inspect fixed wing aircraft automatic flight control systems and components.....	656
Assessment Requirements for ME A225 Inspect fixed wing aircraft automatic flight control systems and components.....	659
ME A226 Inspect aircraft electronic systems and components.....	661
Assessment Requirements for ME A226 Inspect aircraft electronic systems and components.....	664
ME A227 Test and troubleshoot aircraft electrical systems and components.....	668

Assessment Requirements for MEA227 Test and troubleshoot aircraft electrical systems and components	671
MEA228 Test and troubleshoot aircraft instrument systems and components.....	675
Assessment Requirements for MEA228 Test and troubleshoot aircraft instrument systems and components	678
MEA229 Test and troubleshoot aircraft radio frequency navigation and communications systems and components	681
Assessment Requirements for MEA229 Test and troubleshoot aircraft radio frequency navigation and communications systems and components	684
MEA230 Test and troubleshoot fixed wing aircraft automatic flight control systems and components.....	688
Assessment Requirements for MEA230 Test and troubleshoot fixed wing aircraft automatic flight control systems and components	691
MEA231 Inspect, test and troubleshoot rotary wing aircraft automatic flight control systems and components	694
Assessment Requirements for MEA231 Inspect, test and troubleshoot rotary wing aircraft automatic flight control systems and components	697
MEA232 Test and troubleshoot aircraft pulse systems and components.....	700
Assessment Requirements for MEA232 Test and troubleshoot aircraft pulse systems and components.....	703
MEA233 Inspect, test and troubleshoot aircraft inertial navigation and reference systems and components.....	706
Assessment Requirements for MEA233 Inspect, test and troubleshoot aircraft inertial navigation and reference systems and components	709
MEA234 Inspect, test and troubleshoot aircraft global navigation systems and components	711
Assessment Requirements for MEA234 Inspect, test and troubleshoot aircraft global navigation systems and components.....	714
MEA235 Perform advanced troubleshooting in aircraft avionic maintenance.....	716
Assessment Requirements for MEA235 Perform advanced troubleshooting in aircraft avionic maintenance.....	719
MEA238 Perform routine removal and installation of miscellaneous aircraft electrical hardware/components.....	721
Assessment Requirements for MEA238 Perform routine removal and installation of miscellaneous aircraft electrical hardware/components.....	724
MEA239 Fabricate aircraft electrical looms and harnesses	726
Assessment Requirements for MEA239 Fabricate aircraft electrical looms and harnesses	729
MEA240 Use electrical test equipment to perform basic electrical tests.....	731
Assessment Requirements for MEA240 Use electrical test equipment to perform basic electrical tests.....	734
MEA241 Perform aircraft weight and balance calculations as a result of modifications.	736
Assessment Requirements for MEA241 Perform aircraft weight and balance calculations as a result of modifications.....	738
MEA246 Fabricate and/or repair aircraft electrical hardware or parts.....	739
Assessment Requirements for MEA246 Fabricate and/or repair aircraft electrical hardware or parts	742
MEA252 Test, align and troubleshoot aircraft synchro and servo system components ...	744
Assessment Requirements for MEA252 Test, align and troubleshoot aircraft synchro and servo system components	747
MEA260 Use electrical test equipment	749
Assessment Requirements for MEA260 Use electrical test equipment.....	752
MEA261 Use electronic test equipment	754
Assessment Requirements for MEA261 Use electronic test equipment	757
MEA262 Modify/repair aircraft component single layer printed circuit boards.....	759

Assessment Requirements for MEA262 Modify/repair aircraft component single layer printed circuit boards	763
MEA263 Modify/repair aircraft component multi-layer printed circuit boards	765
Assessment Requirements for MEA263 Modify/repair aircraft component multi-layer printed circuit boards	769
MEA264 Remove and install aircraft electrical/avionic components during line maintenance.....	771
Assessment Requirements for MEA264 Remove and install aircraft electrical/avionic components during line maintenance	774
MEA265 Remove and install general aircraft electrical hardware.....	776
Assessment Requirements for MEA265 Remove and install general aircraft electrical hardware	780
MEA266 Terminate and repair aircraft optical fibre cable	782
Assessment Requirements for MEA266 Terminate and repair aircraft optical fibre cable.....	785
MEA270 Lay out avionic systems	787
Assessment Requirements for MEA270 Lay out avionic systems.....	790
MEA271 Lay out avionic flight management systems	792
Assessment Requirements for MEA271 Lay out avionic flight management systems	797
MEA274 Maintain basic light aircraft electrical systems and components	799
Assessment Requirements for MEA274 Maintain basic light aircraft electrical systems and components.....	803
MEA275 Maintain basic light aircraft instrument systems and components	807
Assessment Requirements for MEA275 Maintain basic light aircraft instrument systems and components	811
MEA276 Maintain basic aircraft communication and radio navigation systems and components.....	815
Assessment Requirements for MEA276 Maintain basic aircraft communication and radio navigation systems and components.....	819
MEA277 Maintain twin engine aircraft electrical systems and components	822
Assessment Requirements for MEA277 Maintain twin engine aircraft electrical systems and components	826
MEA278 Inspect, test and troubleshoot instrument display systems and components	830
Assessment Requirements for MEA278 Inspect, test and troubleshoot instrument display systems and components	833
MEA279 Inspect, test and troubleshoot full authority digital engine control systems	836
Assessment Requirements for MEA279 Inspect, test and troubleshoot full authority digital engine control systems	839
MEA280 Inspect, test and troubleshoot flight management systems and components	842
Assessment Requirements for MEA280 Inspect, test and troubleshoot flight management systems and components	845
MEA281 Maintain light aircraft AC powered instrument systems and components.....	848
Assessment Requirements for MEA281 Maintain light aircraft AC powered instrument systems and components	852
MEA282 Repair or overhaul aircraft pulse system components	855
Assessment Requirements for MEA282 Repair or overhaul aircraft pulse system components.....	859
MEA283 Repair or overhaul aircraft display, control and distribution system components.....	862
Assessment Requirements for MEA283 Repair or overhaul aircraft display, control and distribution system components	866
MEA284 Repair or overhaul aircraft instrument system components	869
Assessment Requirements for MEA284 Repair or overhaul aircraft instrument system components.....	873

MEA285 Repair or overhaul aircraft radio frequency communication and navigation system components	875
Assessment Requirements for MEA285 Repair or overhaul aircraft radio frequency communication and navigation system components	879
MEA286 Repair or overhaul aircraft electrical/electro-mechanical components	882
Assessment Requirements for MEA286 Repair or overhaul aircraft electrical/electro-mechanical components	886
MEA287 Repair or overhaul aircraft oxygen system components	889
Assessment Requirements for MEA287 Repair or overhaul aircraft oxygen system components	893
MEA288 Repair or overhaul aircraft audio and visual systems and reproducers	895
Assessment Requirements for MEA288 Repair or overhaul aircraft audio and visual systems and reproducers	898
MEA289 Maintain basic light aircraft avionic systems and components	901
Assessment Requirements for MEA289 Maintain basic light aircraft avionic systems and components	905
MEA290 Fit avionic modification sheet metal components	908
Assessment Requirements for MEA290 Fit avionic modification sheet metal components	911
MEA291 Inspect, test and troubleshoot fixed wing single axis autopilot systems and components	913
Assessment Requirements for MEA291 Inspect, test and troubleshoot fixed wing single axis autopilot systems and components	916
MEA301 Perform aircraft flight servicing	919
Assessment Requirements for MEA301 Perform aircraft flight servicing	922
MEA302 Remove and install aircraft hydro-mechanical and landing gear system components	925
Assessment Requirements for MEA302 Remove and install aircraft hydro-mechanical and landing gear system components	929
MEA303 Remove and install aircraft pneumatic system components	932
Assessment Requirements for MEA303 Remove and install aircraft pneumatic system components	935
MEA304 Remove and install non-pressurised aircraft structural and non-structural components	938
Assessment Requirements for MEA304 Remove and install non-pressurised aircraft structural and non-structural components	942
MEA305 Remove and install aircraft fixed wing flight control system components	944
Assessment Requirements for MEA305 Remove and install aircraft fixed wing flight control system components	947
MEA306 Remove and install engines and engine system components	949
Assessment Requirements for MEA306 Remove and install engines and engine system components	953
MEA307 Remove and install propeller systems and components	956
Assessment Requirements for MEA307 Remove and install propeller systems and components	959
MEA308 Remove and install rotary wing rotor and flight control system components	961
Assessment Requirements for MEA308 Remove and install rotary wing rotor and flight control system components	965
MEA309 Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components	968
Assessment Requirements for MEA309 Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components	972
MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components	975

Assessment Requirements for MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components978

MEA312 Inspect, test and troubleshoot aircraft fixed wing flight control systems and components981

Assessment Requirements for MEA312 Inspect, test and troubleshoot aircraft fixed wing flight control systems and components984

MEA313 Inspect, test and troubleshoot piston engine systems and components987

Assessment Requirements for MEA313 Inspect, test and troubleshoot piston engine systems and components990

MEA314 Inspect, test and troubleshoot gas turbine engine systems and components993

Assessment Requirements for MEA314 Inspect, test and troubleshoot gas turbine engine systems and components996

MEA315 Inspect, test and troubleshoot propeller systems and components999

Assessment Requirements for MEA315 Inspect, test and troubleshoot propeller systems and components1002

MEA316 Inspect, test and troubleshoot rotary wing rotor and control systems and components1005

Assessment Requirements for MEA316 Inspect, test and troubleshoot rotary wing rotor and control systems and components1008

MEA317 Remove and install pressurised aircraft structural and non-structural components1011

Assessment Requirements for MEA317 Remove and install pressurised aircraft structural and non-structural components1015

MEA318 Inspect aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components1018

Assessment Requirements for MEA318 Inspect aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components1022

MEA319 Inspect gas turbine engine systems and components1026

Assessment Requirements for MEA319 Inspect gas turbine engine systems and components1029

MEA320 Test and troubleshoot aircraft hydro-mechanical, gaseous and landing gear systems and components1032

Assessment Requirements for MEA320 Test and troubleshoot aircraft hydro-mechanical, gaseous and landing gear systems and components1036

MEA321 Test and troubleshoot aircraft fixed wing flight control systems and components 1040

Assessment Requirements for MEA321 Test and troubleshoot aircraft fixed wing flight control systems and components1043

MEA322 Test and troubleshoot gas turbine engine systems and components1046

Assessment Requirements for MEA322 Test and troubleshoot gas turbine engine systems and components1049

MEA323 Perform advanced troubleshooting in aircraft mechanical maintenance1052

Assessment Requirements for MEA323 Perform advanced troubleshooting in aircraft mechanical maintenance1055

MEA325 Weigh aircraft and perform aircraft weight and balance calculations as a result of modifications1057

Assessment Requirements for MEA325 Weigh aircraft and perform aircraft weight and balance calculations as a result of modifications1060

MEA327 Fabricate and/or repair aircraft mechanical components or parts1062

Assessment Requirements for MEA327 Fabricate and/or repair aircraft mechanical components or parts1066

MEA328 Maintain and/or repair aircraft mechanical components or parts1068

Assessment Requirements for MEA328 Maintain and/or repair aircraft mechanical components or parts1072

ME A329 Maintain aircraft basic hydraulic and pneumatic components or parts	1075
Assessment Requirements for ME A329 Maintain aircraft basic hydraulic and pneumatic components or parts	1079
ME A330 Maintain aircraft non-primary structural removable components or parts and internal fittings	1081
Assessment Requirements for ME A330 Maintain aircraft non-primary structural removable components or parts and internal fittings	1085
ME A331 Maintain aircraft gas turbine engine components or parts	1087
Assessment Requirements for ME A331 Maintain aircraft gas turbine engine components or parts	1091
ME A332 Maintain aircraft mechanical components or parts	1093
Assessment Requirements for ME A332 Maintain aircraft mechanical components or parts	1097
ME A333 Maintain aircraft piston engine components or parts	1099
Assessment Requirements for ME A333 Maintain aircraft piston engine components or parts	1103
ME A339 Inspect, repair and maintain aircraft structures.....	1105
Assessment Requirements for ME A339 Inspect, repair and maintain aircraft structures	1109
ME A340 Lay out and set up aircraft systems	1113
Assessment Requirements for ME A340 Lay out and set up aircraft systems	1118
ME A341 Apply basic aircraft design characteristics	1120
Assessment Requirements for ME A341 Apply basic aircraft design characteristics	1124
ME A342 Apply basic aircraft power plant design characteristics.....	1126
Assessment Requirements for ME A342 Apply basic aircraft power plant design characteristics.....	1129
ME A343 Remove and install avionic system components	1131
Assessment Requirements for ME A343 Remove and install avionic system components	1134
ME A344 Remove and install aircraft components	1136
Assessment Requirements for ME A344 Remove and install aircraft components	1140
ME A345 Perform scheduled line maintenance activities on gas turbine engine fixed wing aircraft.....	1142
Assessment Requirements for ME A345 Perform scheduled line maintenance activities on gas turbine engine fixed wing aircraft	1146
ME A346 Perform scheduled line maintenance activities on gas turbine engine rotary wing aircraft.....	1149
Assessment Requirements for ME A346 Perform scheduled line maintenance activities on gas turbine engine rotary wing aircraft	1153
ME A347 Perform scheduled line maintenance activities on piston engine fixed wing aircraft.....	1155
Assessment Requirements for ME A347 Perform scheduled line maintenance activities on piston engine fixed wing aircraft	1159
ME A348 Perform scheduled line maintenance activities on piston engine rotary wing aircraft.....	1162
Assessment Requirements for ME A348 Perform scheduled line maintenance activities on piston engine rotary wing aircraft.....	1166
ME A351 Maintain airframe systems of basic light fixed wing aircraft	1169
Assessment Requirements for ME A351 Maintain airframe systems of basic light fixed wing aircraft	1173
ME A352 Maintain basic rotary wing aircraft systems	1177
Assessment Requirements for ME A352 Maintain basic rotary wing aircraft systems	1184
ME A353 Maintain basic light aircraft engines and propellers	1188
Assessment Requirements for ME A353 Maintain basic light aircraft engines and propellers.....	1193
ME A354 Maintain light aircraft pneumatic systems.....	1197

Assessment Requirements for MEA354 Maintain light aircraft pneumatic systems	1201
MEA355 Maintain light aircraft air cycle air conditioning systems	1203
Assessment Requirements for MEA355 Maintain light aircraft air cycle air conditioning systems.....	1207
MEA356 Maintain light piston engine aircraft pressurisation systems	1210
Assessment Requirements for MEA356 Maintain light piston engine aircraft pressurisation systems	1214
MEA357 Inspect, test and repair aircraft fabric surfaces	1217
Assessment Requirements for MEA357 Inspect, test and repair aircraft fabric surfaces.....	1221
MEA358 Re-cover aircraft fabric surfaces	1224
Assessment Requirements for MEA358 Re-cover aircraft fabric surfaces.....	1227
MEA359 Inspect and repair aircraft wooden structures.....	1229
Assessment Requirements for MEA359 Inspect and repair aircraft wooden structures.....	1233
MEA360 Maintain aircraft diesel engines.....	1236
Assessment Requirements for MEA360 Maintain aircraft diesel engines	1240
MEA361 Maintain aircraft two stroke petrol engines.....	1243
Assessment Requirements for MEA361 Maintain aircraft two stroke petrol engines	1247
MEA362 Maintain aircraft vapour cycle air conditioning systems	1250
Assessment Requirements for MEA362 Maintain aircraft vapour cycle air conditioning systems.....	1254
MEA364 Maintain and/or repair small aircraft mechanical components or parts	1257
Assessment Requirements for MEA364 Maintain and/or repair small aircraft mechanical components or parts	1261
MEA365 Assess structural repair/modification requirements and evaluate structural repairs and modifications	1264
Assessment Requirements for MEA365 Assess structural repair/modification requirements and evaluate structural repairs and modifications	1268
MEA366 Perform borescope inspections	1271
Assessment Requirements for MEA366 Perform borescope inspections	1274
MEA367 Repair/modify aircraft composite structure using cold bonding	1276
Assessment Requirements for MEA367 Repair/modify aircraft composite structure using cold bonding	1279
MEA368 Shot peen aircraft components	1282
Assessment Requirements for MEA368 Shot peen aircraft components	1286
MEA369 Inspect and maintain structures and related components of non-pressurised small aircraft	1288
Assessment Requirements for MEA369 Inspect and maintain structures and related components of non-pressurised small aircraft.....	1293
MEA370 Repair the structure of non-pressurised small aircraft	1297
Assessment Requirements for MEA370 Repair the structure of non-pressurised small aircraft.....	1300
MEA371 Perform major repairs and modifications to small aircraft metal structure	1303
Assessment Requirements for MEA371 Perform major repairs and modifications to small aircraft metal structure.....	1306
MEA372 Perform mechanical elementary maintenance	1309
Assessment Requirements for MEA372 Perform mechanical elementary maintenance	1313
MEA380 Repair and/or overhaul aircraft hydraulic system components	1316
Assessment Requirements for MEA380 Repair and/or overhaul aircraft hydraulic system components.....	1320
MEA381 Repair and/or overhaul aircraft pneumatic system components	1323
Assessment Requirements for MEA381 Repair and/or overhaul aircraft pneumatic system components.....	1327
MEA382 Repair and/or overhaul aircraft fuel system components.....	1329

Assessment Requirements for MEA382 Repair and/or overhaul aircraft fuel system components.....1333

MEA383 Repair and/or overhaul gas turbine engine air inlet and compressor components and/or modules1335

Assessment Requirements for MEA383 Repair and/or overhaul gas turbine engine air inlet and compressor components and/or modules1339

MEA384 Repair and/or overhaul gas turbine engine combustion section components and/or modules1342

Assessment Requirements for MEA384 Repair and/or overhaul gas turbine engine combustion section components and/or modules.....1346

MEA385 Repair and/or overhaul gas turbine engine turbine and exhaust section components.....1348

Assessment Requirements for MEA385 Repair and/or overhaul gas turbine engine turbine and exhaust section components1353

MEA386 Repair and/or overhaul gas turbine engine ancillary section components.....1356

Assessment Requirements for MEA386 Repair and/or overhaul gas turbine engine ancillary section components1360

MEA387 Test gas turbine engines and engine modules after overhaul or repair1363

Assessment Requirements for MEA387 Test gas turbine engines and engine modules after overhaul or repair.....1366

MEA389 Repair and/or overhaul propellers.....1368

Assessment Requirements for MEA389 Repair and/or overhaul propellers1372

MEA390 Repair and/or overhaul rotary wing dynamic components1375

Assessment Requirements for MEA390 Repair and/or overhaul rotary wing dynamic components.....1379

MEA391 Repair and/or overhaul aircraft mechanical system components.....1381

Assessment Requirements for MEA391 Repair and/or overhaul aircraft mechanical system components1385

MEA392 Disassemble aircraft piston engines1387

Assessment Requirements for MEA392 Disassemble aircraft piston engines1390

MEA393 Repair and/or overhaul aircraft piston engine cylinder assembly components 1392

Assessment Requirements for MEA393 Repair and/or overhaul aircraft piston engine cylinder assembly components1396

MEA394 Repair and/or overhaul aircraft piston engine crankcase assembly components 1398

Assessment Requirements for MEA394 Repair and/or overhaul aircraft piston engine crankcase assembly components1402

MEA395 Reassemble aircraft piston engines1404

Assessment Requirements for MEA395 Reassemble aircraft piston engines.....1407

MEA396 Assemble aircraft piston engine quick engine change unit.....1409

Assessment Requirements for MEA396 Assemble aircraft piston engine quick engine change unit1412

MEA397 Test aircraft piston engines after repair or overhaul1414

Assessment Requirements for MEA397 Test aircraft piston engines after repair or overhaul.....1418

MEA401 Inspect aircraft structures1420

Assessment Requirements for MEA401 Inspect aircraft structures1423

MEA405 Repair/modify aircraft composite material structure/components.....1426

Assessment Requirements for MEA405 Repair/modify aircraft composite material structure/components1430

MEA406 Repair/modify aircraft non-primary structural sheet metal components.....1432

Assessment Requirements for MEA406 Repair/modify aircraft non-primary structural sheet metal components1436

MEA407 Repair/modify aircraft non-primary structural non-metallic components.....1438

Assessment Requirements for MEA407 Repair/modify aircraft non-primary structural non-metallic components	1442
MEA410 Maintain aircraft structure/components	1444
Assessment Requirements for MEA410 Maintain aircraft structure/components	1447
MEA411 Remove surface coatings from aircraft or aircraft components	1449
Assessment Requirements for MEA411 Remove surface coatings from aircraft or aircraft components	1453
MEA412 Pre-treat aluminium alloy surfaces	1455
Assessment Requirements for MEA412 Pre-treat aluminium alloy surfaces.....	1459
MEA413 Seal aircraft and aircraft component structural seams	1461
Assessment Requirements for MEA413 Seal aircraft and aircraft component structural seams	1465
MEA414 Remove light corrosion from aircraft	1467
Assessment Requirements for MEA414 Remove light corrosion from aircraft	1471
MEA415 Paint aircraft surfaces	1473
Assessment Requirements for MEA415 Paint aircraft surfaces	1478
MEA416 Apply aircraft identification markings, graphics and decals	1480
Assessment Requirements for MEA416 Apply aircraft identification markings, graphics and decals	1485
MEA417 Apply specialty coatings to aircraft	1487
Assessment Requirements for MEA417 Apply specialty coatings to aircraft	1492
MEA418 Perform basic repair of aircraft internal fittings during line maintenance	1494
Assessment Requirements for MEA418 Perform basic repair of aircraft internal fittings during line maintenance.....	1497
MEA419 Inspect and repair/modify aircraft cabin/cockpit non-primary structure components	1500
Assessment Requirements for MEA419 Inspect and repair/modify aircraft cabin/cockpit non-primary structure components	1504
MEA420 Fabricate basic structural components for aircraft.....	1507
Assessment Requirements for MEA420 Fabricate basic structural components for aircraft	1511
MEA421 Fabricate advanced structural components for aircraft	1514
Assessment Requirements for MEA421 Fabricate advanced structural components for aircraft.....	1518
MEA422 Repair/modify aircraft metal structure.....	1521
Assessment Requirements for MEA422 Repair/modify aircraft metal structure	1524
MEA423 Aircraft structure major disassembly and reassembly.....	1527
Assessment Requirements for MEA423 Aircraft structure major disassembly and reassembly	1531
MEA424 Evaluate aircraft non-destructive tests	1534
Assessment Requirements for MEA424 Evaluate aircraft non-destructive tests.....	1538
MEA425 Perform bolted composite skin repairs	1541
Assessment Requirements for MEA425 Perform bolted composite skin repairs	1544
MEA430 Gas weld aircraft components	1546
Assessment Requirements for MEA430 Gas weld aircraft components.....	1549
MEA431 Braze weld aircraft components	1551
Assessment Requirements for MEA431 Braze weld aircraft components	1554
MEA432 Weld aircraft components using the gas tungsten arc welding process	1556
Assessment Requirements for MEA432 Weld aircraft components using the gas tungsten arc welding process.....	1559
MEA433 Weld aircraft components using the gas metal arc welding process.....	1561
Assessment Requirements for MEA433 Weld aircraft components using the gas metal arc welding process.....	1564
MEA434 Weld aircraft components using the plasma arc welding process.....	1566

Assessment Requirements for MEA434 Weld aircraft components using the plasma arc welding process.....	1569
ME A435 Weld aircraft components using the manual metal arc welding process	1571
Assessment Requirements for MEA435 Weld aircraft components using the manual metal arc welding process.....	1574
ME A501 Maintain and fit anti-G suits.....	1576
Assessment Requirements for MEA501 Maintain and fit anti-G suits	1580
ME A502 Maintain and fit helmets.....	1583
Assessment Requirements for MEA502 Maintain and fit helmets	1587
ME A503 Maintain and fit immersion suits.....	1590
Assessment Requirements for MEA503 Maintain and fit immersion suits.....	1594
ME A504 Maintain and fit oxygen masks	1597
Assessment Requirements for MEA504 Maintain and fit oxygen masks.....	1601
ME A505 Maintain and pack parachutes	1604
Assessment Requirements for MEA505 Maintain and pack parachutes	1608
ME A507 Maintain, pack and fit survival inflatable buoyancy vests.....	1611
Assessment Requirements for MEA507 Maintain, pack and fit survival inflatable buoyancy vests	1616
ME A508 Maintain, install and remove restraint systems.....	1619
Assessment Requirements for MEA508 Maintain, install and remove restraint systems.....	1623
ME A509 Manufacture, repair and alter aircraft related fabric components	1625
Assessment Requirements for MEA509 Manufacture, repair and alter aircraft related fabric components.....	1630
ME A510 Maintain seat and pod electrical and electronic systems	1633
Assessment Requirements for MEA510 Maintain seat and pod electrical and electronic systems.....	1637
ME A511 Operate and maintain sewing machines and overlockers.....	1639
Assessment Requirements for MEA511 Operate and maintain sewing machines and overlockers	1644
ME A512 Maintain general aviation recovery devices with ballistic parachute systems	1647
Assessment Requirements for MEA512 Maintain general aviation recovery devices with ballistic parachute systems.....	1650
ME A513 Maintain and pack survival inflatable life rafts	1652
Assessment Requirements for MEA513 Maintain and pack survival inflatable life rafts.....	1656
ME A514 Maintain and pack escape slides	1659
Assessment Requirements for MEA514 Maintain and pack escape slides.....	1663
ME A601 Maintain aircraft egress systems.....	1666
Assessment Requirements for MEA601 Maintain aircraft egress systems	1671
ME A602 Remove and install aircraft stores management system components	1673
Assessment Requirements for MEA602 Remove and install aircraft stores management system components	1677
ME A603 Remove and install aircraft stores suspension system components	1680
Assessment Requirements for MEA603 Remove and install aircraft stores suspension system components	1684
ME A604 Inspect, test and troubleshoot aircraft stores management systems and components.....	1686
Assessment Requirements for MEA604 Inspect, test and troubleshoot aircraft stores management systems and components.....	1690
ME A605 Inspect, test and troubleshoot aircraft stores suspension systems and components.....	1693
Assessment Requirements for MEA605 Inspect, test and troubleshoot aircraft stores suspension systems and components	1697
ME A701 Produce aeronautical engineering related graphics	1699
Assessment Requirements for MEA701 Produce aeronautical engineering related graphics.....	1705

MEA702 Produce avionics engineering related graphics	1709
Assessment Requirements for MEA702 Produce avionics engineering related graphics	1714
MEA703 Apply aeronautical modelling for computer-aided engineering	1718
Assessment Requirements for MEA703 Apply aeronautical modelling for computer-aided engineering	1723
MEA704 Apply avionic modelling for computer-aided engineering.....	1727
Assessment Requirements for MEA704 Apply avionic modelling for computer-aided engineering	1732
MEA705 Apply basic scientific principles and techniques in aeronautical engineering situations.....	1736
Assessment Requirements for MEA705 Apply basic scientific principles and techniques in aeronautical engineering situations	1740
MEA706 Apply basic scientific principles and techniques in avionic engineering situations	1744
Assessment Requirements for MEA706 Apply basic scientific principles and techniques in avionic engineering situations	1748
MEA707 Select and test aeronautical engineering materials.....	1752
Assessment Requirements for MEA707 Select and test aeronautical engineering materials	1757
MEA708 Select and test avionic engineering materials	1760
Assessment Requirements for MEA708 Select and test avionic engineering materials ..	1765
MEA709 Apply aeronautical structure design techniques	1768
Assessment Requirements for MEA709 Apply aeronautical structure design techniques	1775
MEA710 Apply aeronautical system design techniques	1778
Assessment Requirements for MEA710 Apply aeronautical system design techniques ..	1785
MEA711 Apply avionic analogue design techniques	1788
Assessment Requirements for MEA711 Apply avionic analogue design techniques.....	1795
MEA712 Apply avionic digital design techniques	1798
Assessment Requirements for MEA712 Apply avionic digital design techniques	1805
MEA713 Integrate aeronautical fundamentals into an engineering task.....	1808
Assessment Requirements for MEA713 Integrate aeronautical fundamentals into an engineering task.....	1813
MEA714 Integrate avionic fundamentals into an engineering task.....	1817
Assessment Requirements for MEA714 Integrate avionic fundamentals into an engineering task.....	1822
MEA715 Evaluate aeroplane flight control systems.....	1825
Assessment Requirements for MEA715 Evaluate aeroplane flight control systems	1831
MEA716 Evaluate avionic analogue systems	1834
Assessment Requirements for MEA716 Evaluate avionic analogue systems	1840
MEA717 Evaluate avionic digital systems.....	1843
Assessment Requirements for MEA717 Evaluate avionic digital systems	1849
MEA718 Evaluate rotorcraft flight control systems.....	1853
Assessment Requirements for MEA718 Evaluate rotorcraft flight control systems	1858
MEA719 Evaluate aircraft electrical systems	1861
Assessment Requirements for MEA719 Evaluate aircraft electrical systems	1867
MEA720 Evaluate aircraft gas turbine engine power plants.....	1870
Assessment Requirements for MEA720 Evaluate aircraft gas turbine engine power plants	1876
MEA721 Evaluate aircraft hydro-mechanical systems	1879
Assessment Requirements for MEA721 Evaluate aircraft hydro-mechanical systems ..	1885
MEA722 Evaluate aircraft piston engine power plants.....	1888
Assessment Requirements for MEA722 Evaluate aircraft piston engine power plants ..	1894
MEA723 Evaluate aircraft pneumatic systems	1897
Assessment Requirements for MEA723 Evaluate aircraft pneumatic systems	1902
MEA724 Evaluate aircraft structure	1905
Assessment Requirements for MEA724 Evaluate aircraft structure.....	1910

ME A725 Apply advanced scientific principles and techniques in avionic engineering situations.....	1913
Assessment Requirements for ME A725 Apply advanced scientific principles and techniques in avionic engineering situations.....	1917
ME A726 Apply aircraft electrical system design techniques.....	1921
Assessment Requirements for ME A726 Apply aircraft electrical system design techniques.....	1928
ME A727 Apply calculus in avionic engineering situations.....	1931
Assessment Requirements for ME A727 Apply calculus in avionic engineering situations.....	1934
ME A729 Apply configuration management procedures in airworthiness engineering management.....	1936
Assessment Requirements for ME A729 Apply configuration management procedures in airworthiness engineering management.....	1941
ME A730 Apply systems engineering procedures to airworthiness engineering design project management.....	1943
Assessment Requirements for ME A730 Apply systems engineering procedures to airworthiness engineering design project management.....	1948
MEM05004C Perform routine oxy acetylene welding.....	1950
MEM05006C Perform brazing and or silver soldering.....	1956
MEM05007C Perform manual heating and the rmal cutting.....	1962
MEM05012C Perform routine manual metal arc welding.....	1968
MEM05015D Weld using manual metal arc welding process.....	1973
MEM05016C Perform advanced welding using manual metal arc welding process.....	1981
MEM05017D Weld using gas metal arc welding process.....	1988
MEM05018C Perform advanced welding using gas metal arc welding process.....	1996
MEM05019D Weld using gas tungsten arc welding process.....	2002
MEM05020C Perform advanced welding using gas tungsten arc welding process.....	2010
MEM05022C Perform advanced welding using oxy acetylene welding process.....	2016
MEM05026C Apply welding principles.....	2023
MEM05043B Perform welds to code standards using gas metal arc welding process.....	2030
MEM05044B Perform welds to code standards using gas tungsten arc welding process.....	2036
MEM05046B Perform welds to code standards using manual metal arc welding process.....	2042
MEM05049B Perform routine gas tungsten arc welding.....	2048
MEM05050B Perform routine gas metal arc welding.....	2054
MEM05051A Select welding processes.....	2060
MEM05052A Apply safe welding practices.....	2066
MEM06003C Carry out heat treatment.....	2075
MEM07001B Perform operational maintenance of machines/equipment.....	2081
MEM07002B Perform precision shaping/planning/slotting operations.....	2087
MEM07005C Perform general machining.....	2094
MEM07006C Perform lathe operations.....	2102
MEM07007C Perform milling operations.....	2110
MEM07008D Perform grinding operations.....	2117
MEM07009B Perform precision jig boring operations.....	2125
MEM07010B Perform tool and cutter grinding operations.....	2131
MEM07011B Perform complex milling operations.....	2137
MEM07012B Perform complex grinding operations.....	2143
MEM07013B Perform machining operations using horizontal and/or vertical boring machines.....	2149
MEM07015B Set computer controlled machines/processes.....	2154
MEM07016C Set and edit computer controlled machines/processes.....	2161
MEM07018C Write basic NC/CNC programs.....	2168
MEM07019C Program NC/CNC machining centre.....	2175
MEM07020C Program multiple spindle and/or multiple axis NC/CNC machining centre.....	2182

MEM07021B Perform complex lathe operations	2190
MEM07022C Program CNC wire cut machines	2197
MEM07024B Operate and monitor machine/process	2204
MEM07028B Operate computer controlled machines/processes.....	2210
MEM07030C Perform metal spinning lathe operations (basic).....	2217
MEM07031C Perform metal spinning lathe operations (complex)	2224
MEM07032B Use workshop machines for basic operations	2231
MEM08001B Perform wire, jig and barrel load/unload work	2237
MEM08002C Pre-treat work for subsequent surface coating	2243
MEM08003C Perform electroplating operations	2249
MEM08004B Finish work using wet, dry and vapour deposition methods	2256
MEM08006B Produce clear and/or coloured and/or sealed anodised films on aluminium	2263
MEM08018B Electroplate engineering coatings	2269
MEM09002B Interpret technical drawing	2276
MEM09003B Prepare basic engineering drawing	2282
MEM09009C Create 2D drawings using computer aided design system.....	2289
MEM12001B Use comparison and basic measuring devices	2296
MEM12003B Perform precision mechanical measurement	2301
MEM12023A Perform engineering measurements	2307
MEM12024A Perform computations	2313
MEM13003B Work safely with industrial chemicals and materials.....	2320
MEM13013B Work safely with ionizing radiation.....	2326
MEM15004B Perform inspection	2334
MEM15010B Perform laboratory procedures	2340
MEM15017B Use and maintain reference standards	2347
MEM16002C Conduct formal interviews and negotiations.....	2354
MEM16006A Organise and communicate information.....	2360
MEM16008A Interact with computing technology	2366
MEM16010A Write reports.....	2372
MEM17002B Conduct workplace assessment.....	2379
MEM18001C Use hand tools	2386
MEM18002B Use power tools/hand held operations.....	2392
MEM22013A Coordinate engineering projects.....	2398
MEM23004A Apply technical mathematics	2407
MEM23007A Apply calculus to engineering tasks	2413
MEM234019A Apply finite element analysis in engineering design.....	2419
MEM234022A Apply advanced calculus to technology problems	2426
MEM24001B Perform basic penetrant testing.....	2432
MEM24002B Perform penetrant testing.....	2439
MEM24003B Perform basic magnetic particle testing.....	2446
MEM24004B Perform magnetic particle testing.....	2453
MEM24005B Perform basic eddy current testing.....	2460
MEM24006B Perform eddy current testing.....	2467
MEM24007B Perform ultrasonic thickness testing.....	2474
MEM24008B Perform ultrasonic testing	2481
MEM24009B Perform basic radiographic testing.....	2489
MEM24010B Perform radiographic testing.....	2496
MEM24011B Establish non-destructive tests.....	2504
MEM24012C Apply metallurgy principles	2511
MEM30007A Select common engineering materials	2518
MEM30012A Apply mathematical techniques in a manufacturing engineering or related environment.....	2525
MSAENV272B Participate in environmentally sustainable work practices	2531

MSAENV472B Implement and monitor environmentally sustainable work practices ..	2539
MSAENV672B Develop workplace policy and procedures for environmental sustainability	2548
MSFSF2001 Cut single layer fabrics	2556
Assessment Requirements for MSFSF2001 Cut single layer fabrics	2560
MSFSF2002 Machine sew materials	2562
Assessment Requirements for MSFSF2002 Machine sew materials	2566
MSFUP3012 Apply marine sewing and installation techniques	2568
Assessment Requirements for MSFUP3012 Apply marine sewing and installation techniques	2572
PMBPROD262B Operate tyre curing equipment	2574
PMBPROD263B Operate retread curing equipment	2581
PMBPROD264C Check recycle wash process	2588
PMBPROD265C Operate portable vulcanising equipment	2594
PMBPROD266B Prepare tyre casings for retreading	2602
PMBPROD324B Inspect tyres for retreading	2609
PMBPROD325B Lay on tyre retreads	2616
PMBPROD326B Inspect tyres	2623
PSPMNGT610A Manage public sector financial resources	2630
TAEASS401B Plan assessment activities and processes	2638
TAEASS402B Assess competence	2645
TAEASS403B Participate in assessment validation	2653
TAEASS502B Design and develop assessment tools	2658
TAEDEL301A Provide work skill instruction	2666
TAEDEL402A Plan, organise and facilitate learning in the workplace	2674
TAEDES401A Design and develop learning programs	2682
MEA Aeroskills Training Package	2688
MEASS00245 AMW001 Electrical component repair/overhaul	2690
MEASS00246 AMW002 Mechanical and electro-mechanical instrument component repair/overhaul	2692
MEASS00247 AMW003 Aircraft display, control and distribution system component repair/overhaul	2694
MEASS00248 AMW004 Oxygen system component repair/overhaul	2696
MEASS00249 AMW005 Aircraft radio frequency communication and navigation system component repair/overhaul	2698
MEASS00250 AMW006 Aircraft pulse system component repair/overhaul	2700
MEASS00251 AMW007 Aircraft audio and visual system and reproducer repair/overhaul	2702
MEASS00252 AMW008 Hydraulic system component repair/overhaul	2704
MEASS00253 AMW009 Electro-hydraulic component repair/overhaul	2706
MEASS00254 AMW010 Pneumatic system component repair/overhaul	2708
MEASS00255 AMW011 Electro-pneumatic component repair/overhaul	2710
MEASS00256 AMW012 Fuel system component repair/overhaul	2712
MEASS00257 AMW013 Gas turbine engine air inlet and compressor module/component repair/overhaul	2714
MEASS00258 AMW014 Gas turbine engine combustion section module/component repair/overhaul	2716
MEASS00259 AMW015 Gas turbine engine turbine and exhaust module/component repair/overhaul	2718
MEASS00260 AMW016 Gas turbine engine ancillary section module/component repair/overhaul	2720
MEASS00261 AMW017 Piston engine disassembly for repair/overhaul	2722
MEASS00262 AMW018 Repair and/or overhaul aircraft piston engine cylinder assembly components	2724

MEASS00263 AMW019 Repair and/or overhaul aircraft piston engine crankcase assembly components.....	2726
MEASS00264 AMW020 Reassemble aircraft piston engines	2728
MEASS00265 AMW021 Assemble aircraft piston engine quick engine change unit.....	2730
MEASS00266 AMW022 Test aircraft piston engines after repair or overhaul	2732
MEASS00267 AMW023 Propeller repair/overhaul	2734
MEASS00268 AMW024 Rotary wing dynamic component repair/overhaul.....	2736
MEASS00269 AMW025 Mechanical system component repair/overhaul.....	2738
MEASS00270 AMW026 Composite structure maintenance	2740
MEASS00271 LME001 Electrical – B1.1 Licence Exclusions E1 and E4 Removal.....	2742
MEASS00272 LME002 Electrical B1.1 Licence Exclusions E1 and E4 Removal (small aircraft with gas turbine engine).....	2744
MEASS00273 LME003 Electrical – B1.2, B1.3 or B1.4 Licence Exclusions E1 and E4 Removal.....	2746
MEASS00274 LME004 Electrical – B1.2 or B1.4 Licence Exclusions E1 and E4 Removal (small aircraft/helicopters).....	2748
MEASS00275 LME005 Electrical – B2 Licence Exclusions E1 and E4 Removal	2750
MEASS00276 LME006 Electrical – B2 Licence Exclusions E1 and E4 Removal (small aircraft or helicopters).....	2752
MEASS00277 LME007 Airframe – B1.1 Licence Exclusion E2 Removal	2754
MEASS00278 LME008 Airframe – B1.1 Licence Exclusion E2 Removal (small aircraft with gas turbine engine).....	2756
MEASS00279 LME009 Airframe – B1.2 Licence Exclusion E2 Removal	2758
MEASS00280 LME010 Airframe – B1.2 Licence Exclusion E2 Removal (working on small aircraft)	2760
MEASS00281 LME011 Airframe – B1.3 and B1.4 Licence Exclusion E2 Removal.....	2762
MEASS00282 LME012 Airframe – B1.4 Licence Exclusion E2 Removal (working on basic helicopters)	2764
MEASS00283 LME013 Power Plant – B1.1 Licence Exclusion E3 Removal.....	2766
MEASS00284 LME014 Power Plant – B1.2 Licence Exclusion E3 Removal.....	2768
MEASS00285 LME015 Power Plant – B1.2 Licence Exclusion E3 Removal (working on small aircraft)	2770

MEA20415 Certificate II in Aeroskills

Modification History

Release 2 - Correction of errors to unit titles in packaging rules in Group B Electives.
Equivalent.

Qualification Description

This qualification applies to employees in aviation maintenance workshops who are required to perform repair and overhaul tasks on a limited range of aircraft electrical, hydraulic, pneumatic, electro-hydraulic and electro-pneumatic components, or who perform simple repairs on a limited range of structural components.

Units of competency that comprise this qualification are a mix of common units that apply to all technical employment streams covered by the MEA Aeroskills Training Package (core units) and technical stream units that are specific to a technical employment stream (elective units).

The qualification provides significant credits towards higher level Aeroskills Certificates.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA). Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA20415 Certificate II in Aeroskills, competency must be demonstrated in one of:

- Avionic: **Twelve (12)** units consisting of **eight (8)** core units plus **three (3)** units from elective Group A and **one (1)** unit from either Group B or Group C
- Mechanical: **Twelve (12)** units consisting of **eight (8)** core units plus **three (3)** units from elective Group B and **one (1)** unit from either of Groups A and C
- Structures: **Eleven (11)** units consisting of **eight (8)** core units plus **two (2)** units from elective Group C and **one (1)** unit from either of Groups A and B.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA117	Apply self in the aviation maintenance environment	

Unit code	Unit title	Prerequisites
MSAENV272B	Participate in environmentally sustainable work practices	

Elective units of competency

Group A

Unit code	Unit title	Prerequisites
MEA238	Perform routine removal and installation of miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA239	Fabricate aircraft electrical looms and harnesses	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA240	Use electrical test equipment to perform basic electrical tests	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Group B

Unit code	Unit title	Prerequisites
MEA329	Maintain aircraft basic hydraulic and pneumatic components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA330	Maintain aircraft non-primary structural removable components or parts and internal fittings	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA331	Maintain aircraft gas turbine engine components or parts	MEA101, MEA103 MEA105, MEA107

		MEA108, MEA109
MEA332	Maintain aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA333	Maintain aircraft piston engine components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Group C

Unit code	Unit title	Prerequisites
MEA406	Repair/modify aircraft non-primary structural sheet metal components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA407	Repair/modify aircraft non-primary structural non-metallic components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Qualification Mapping Information

Release 2 - Correction of errors to unit titles in packaging rules in Group B Electives.
Equivalent

Supersedes and is equivalent to MEA20411 Certificate II in Aeroskills

MEA20515 Certificate II in Aircraft Line Maintenance

Modification History

Release 1 - New qualification

Qualification Description

This qualification is applicable to employees of airlines and other operators of piston, jet and turbo-propeller aircraft and helicopters who are required to hold a Civil Aviation Safety Authority (CASA) A Licence to perform and certify a range of specified maintenance tasks that can be performed with the aircraft on a flight line or at the departure gate. On completion of the required maintenance tasks the individual is authorised to release the aircraft to service.

The qualification satisfies CASA requirements for the grant, under Civil Aviation Safety Regulation (CASR) Part 66 of an Aircraft Maintenance Engineer A Licence when:

- the skill and knowledge requirements align with CASA syllabus requirements described under 'Licensing' in the Companion Volume Implementation Guide
- training has been delivered in accordance with the requirements of CASR Part 147.
-

The units of competency that comprise this qualification consist of a mix of:

- common units that are applicable to all of the employment streams covered by the MEA Aeroskills Training Package or are of an administrative nature relating to the CASA A Licence
- a combination of Avionic, Mechanical and Structures Technical Stream units that apply to the range of tasks performed by the holders of CASA A Licences.

This qualification provides a number of credits towards higher level Aeroskills Certificates and towards the MEA50215 Diploma of Aeroskills (Mechanical) which is required for the grant of a CASA B1 Licence.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA20515 Certificate II in Aircraft Line Maintenance, competency must be demonstrated in **fifteen (15)** units of competency, as follows:

- **fourteen (14)** core units made up of common, imported and technical stream units

- **one (1)** unit from elective Group A chosen according to the CASA A Licence that is being sought.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA117	Apply self in the aviation maintenance environment	
MEA119	Perform administrative processes to prepare for certification of civil aircraft A level line maintenance	All Certificate II units relevant to the applicable A Licence
MEA240	Use electrical test equipment to perform basic electrical tests	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA264	Remove and install aircraft electrical/avionic components during line maintenance	MEA265
MEA265	Remove and install general aircraft electrical hardware	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA344	Remove and install aircraft components	MEA101, MEA103

Unit code	Unit title	Prerequisites
		MEA105, MEA107 MEA108, MEA109
MEA418	Perform basic repair of aircraft internal fittings during line maintenance	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MSAENV272B	Participate in environmentally sustainable work practices	

Elective units of competency

Group A

Unit code	Unit title	Prerequisites	Unit applicability
MEA345	Perform scheduled line maintenance activities on gas turbine engine fixed wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Mandatory where A1 Licence is sought
MEA346	Perform scheduled line maintenance activities on gas turbine engine rotary wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Mandatory where A3 Licence is sought
MEA347	Perform scheduled line maintenance activities on piston engine fixed wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Mandatory where A2 Licence is sought
MEA348	Perform scheduled line maintenance activities on piston engine rotary wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Mandatory where A4 Licence is sought

Qualification Mapping Information

Supersedes and is equivalent to MEA20511 Certificate II in Aircraft Line Maintenance

MEA20615 Certificate II in Aircraft Surface Finishing

Modification History

Release 2 - Correction of errors to unit titles in packaging rules in Group A Electives

Release 1 - New qualification

Qualification Description

This qualification is applicable to employees of Aircraft Maintenance Organisations (AMOs) or specialist aircraft surface finishing organisations who are involved in the stripping of old finishes and in the preparation of aircraft and aircraft component surfaces for the application of paint and other specialist surface finishes. A limited range of component removal and installation tasks related to surface finishing tasks may also be performed.

Units of competency that comprise this qualification are a mix of common units that are applicable to all employment streams at the Certificate II level, plus a number of structures technical stream units that relate to aircraft surface finishing and minor repairs, plus a mechanical technical stream unit that provides optional multi-skilling.

The qualification provides a significant number of credits towards surface finishing qualifications at Certificate III and IV levels. The common units also provide credit towards other Aeroskills qualifications and the elective units would count towards a MEA20415 Certificate II in Aeroskills.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA). Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA20615 Certificate II in Aircraft Surface Finishing competency must be demonstrated in **twelve (12)** or **thirteen (13)** units of competency, depending on the choice of specialist units. These units include:

- **eleven (11)** core units consisting of common, imported and technical stream units
- either elective Group A (**one (1)** unit) or Group B (**two (2)** units).

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA117	Apply self in the aviation maintenance environment	
MEA411	Remove surface coatings from aircraft or aircraft components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA412	Pre-treat aluminium alloy surfaces	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA413	Seal aircraft and aircraft component structural seams	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MSAENV272B	Participate in environmentally sustainable work practices	

Elective units of competency

Group A

Unit code	Unit title	Prerequisites
MEA330	Maintain aircraft non-primary structural removable components or parts and internal fittings	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Group B

Unit code	Unit title	Prerequisites
MEA406	Repair/modify aircraft non-primary structural sheet metal components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA407	Repair/modify aircraft non-primary structural non-metallic components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Qualification Mapping Information

Release 2 - Correction of error to unit title in Group A Electives. Equivalent.

Supersedes and is equivalent qualification MEA20611 Certificate II in Aircraft Surface Finishing

MEA30115 Certificate III in Aircraft Surface Finishing

Modification History

Release 1 - New qualification

Qualification Description

This qualification is applicable to employees of aircraft maintenance organisations, or of specialist aircraft surface finishing organisations who are required to prepare the surfaces of aircraft and aircraft components for the application of surface finishes, apply paint, specialist finishes and decals or stencils. Also required is the application of aircraft registration markings, national markings and organisational logos.

The units of competency that comprise this qualification are a mix of:

- common units that apply to all Aeroskills specialist streams at Certificate III and IV levels
- structures technical stream units relating to aircraft surface finishing
- imported automotive units relating to the application of paint finishes.

This qualification fully articulates with the MEA40915 Certificate IV in Aircraft Surface Finishing and the common units provide a number of credits towards other Aeroskills qualifications at Certificate III and IV levels.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA). Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA30115 Certificate III in Aircraft Surface Finishing, competency must be demonstrated in **seventeen (17)** core units of competency. Units must be chosen as specified under the conditions set out below.

There are no elective units for this qualification.

Core units of competency

- Complete all **eight (8)** of the common and imported core units listed below.

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	
MSAENV272B	Participate in environmentally sustainable work practices	

- Plus the **nine (9)** core technical stream and imported units listed below.

Unit code	Unit title	Prerequisites
AURVTP2003	Prepare spray painting materials and equipment	
AURVTP3012	Apply air dry and polyurethane enamel refinishing materials	
MEA411	Remove surface coatings from aircraft or aircraft components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA412	Pre-treat aluminium alloy surfaces	MEA101, MEA103 MEA105, MEA107

Unit code	Unit title	Prerequisites
		MEA108, MEA109
MEA413	Seal aircraft and aircraft component structural seams	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA414	Remove light corrosion from aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA415	Paint aircraft surfaces	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA416	Apply aircraft identification markings, graphics and decals	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA417	Apply specialty coatings to aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Qualification Mapping Information

Supersedes and is equivalent to MEA30111 Certificate III in Aircraft Surface Finishing

MEA30215 Certificate III in Aeroskills (Mechatronics)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed within the General Aviation industry sector on the maintenance of small aircraft who are not seeking direct progression to a Civil Aviation Safety Authority (CASA) B1.2 Aircraft Maintenance Engineer Licence limited to basic small aircraft maintenance. It may also be of use as a first Aeroskills qualification for individuals transitioning from an allied trade to employment on small aircraft maintenance.

Individuals who intend to seek the grant of a licence in the future should consider the requirements for the MEA41015 Certificate IV in Aeroskills (Mechatronics) when selecting elective units of competency for this qualification.

Depending on the choice of elective units this qualification articulates with the MEA41015 Certificate IV in Aeroskills (Mechatronics) and a number of units also provide credits towards other qualifications at Certificate IV and Diploma levels.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA30215 Certificate III in Aeroskills (Mechatronics), competency must be demonstrated in **twenty (20)** units of competency, as follows:

- **fifteen (15)** core units consisting of common, technical stream and imported units
- **five (5)** elective units drawn from the technical stream units listed in Group A while observing the unit selection guidelines.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	

MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	
MEA148	Apply mathematics and physics in aviation maintenance	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA301	Perform aircraft flight servicing	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA364	Maintain and/or repair small aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA369	Inspect and maintain structures and related components of non-pressurised small aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

MSAENV272B	Participate in environmentally sustainable work practices	Nil
------------	---	-----

Elective units of competency

Group A

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA202	Remove and install basic aircraft electrical system components	MEA201	Required for electrical retractable undercarriage maintenance – do not take with MEA274
MEA210	Inspect, test and troubleshoot basic aircraft electrical systems and components	MEA202, MEA246	Required for electrical retractable undercarriage maintenance – do not take with MEA274
MEA274	Maintain basic light aircraft electrical systems and components	MEA246	Required for 100 hourly inspection on basic light aircraft or helicopters
MEA275	Maintain basic light aircraft instrument systems	MEA246	Required for 100 hourly inspection on basic light aircraft or helicopters
MEA276	Maintain basic light aircraft communication and radio navigation systems	MEA246	Required for 100 hourly inspection on basic light aircraft or helicopters
MEA302	Remove and install aircraft hydro-mechanical and landing gear system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Required for hydraulic retractable undercarriage maintenance

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA304	Remove and install non-pressurised aircraft structural and non-structural components	MEA302	Do not take with MEA317 – MEA363 provides credits towards this unit
MEA306	Remove and install engines and engine system components	MEA302	Applicable to piston and gas turbine engines
MEA307	Remove and install propeller systems and components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Required for variable pitch propellers
MEA308	Remove and install rotary wing rotor and flight control system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Required for helicopters with powered flight controls – do not take with MEA352
MEA309	Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components	MEA302	Required for hydraulic retractable undercarriage maintenance
MEA313	Inspect, test and troubleshoot piston engine systems and components	MEA306	Required for supercharged and turbocharged engines
MEA314	Inspect, test and troubleshoot gas turbine engine systems and components	MEA306	Required for gas turbine engines
MEA315	Inspect, test and troubleshoot propeller systems and components	MEA307	Required for variable pitch propellers
MEA316	Inspect, test and troubleshoot rotary wing rotor and control systems and components	MEA308	Required for helicopters with powered flight controls – count as 2 units - do not take with MEA352

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA351	Maintain airframe systems of basic light fixed wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Required for 100 hourly inspection on basic light aircraft
MEA352	Maintain basic rotary wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Required for 100 hourly inspection on basic helicopters
MEA353	Maintain basic light aircraft engines and propellers	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Required for 100 hourly inspection on basic light aircraft or helicopters
MEA354	Maintain light aircraft pneumatic systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA355	Maintain light aircraft air cycle air conditioning systems	MEA201, MEA246	
MEA356	Maintain light piston engine aircraft pressurisation systems	MEA201, MEA246	
MEA357	Inspect, test and repair aircraft fabric surfaces	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA359	Inspect and repair aircraft wooden structures	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA360	Maintain aircraft diesel engines	MEA353	
MEA361	Maintain aircraft two stroke petrol engines	MEA353	
MEA362	Maintain aircraft vapour cycle air conditioning systems	MEA201, MEA246	
MEA367	Repair/modify aircraft	MEA369	Do not take with

Unit code	Unit title	Prerequisites	Unit selection guidelines
	composite structure using cold bonding		MEA405
MEA370	Repair the structure of non-pressurised small aircraft	MEA369	
MEA371	Perform major repairs and modifications to small aircraft metal structure	MEA369, MEA370	
MEA405	Repair/modify aircraft composite material structure/components	MEA401 Note that MEA369 is equivalent to MEA401	Required for repairs to composite primary and secondary structure

Qualification Mapping Information

Supersedes and is equivalent to MEA30211 Certificate III in Aeroskills (Mechatronics)

MEA30315 Certificate III in Aircraft Life Support and Furnishing

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to members of the Australian Defence Force (ADF) and to employees of Aircraft Maintenance Organisations (AMOs) who are maintaining aircraft and personal life support equipment and aircraft furnishings.

The qualification consists of a number of common units plus mandatory and elective technical stream units, including a number of imported units dealing with explosive ordnance (pyrotechnics) safety and inspection, and with sewing, trimming and use of fabric adhesives.

The qualification articulates with MEA41115 Certificate IV in Aircraft Life Support and Furnishing and the common units and the elective Avionic, Mechanical and Structures Technical Stream units provide a number of credits towards other Aeroskills Certificates at Certificate II, III and IV levels.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and the Civil Aviation Safety Authority (CASA). Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA30315 Certificate III in Aircraft Life Support and Furnishing, competency must be demonstrated in **twenty-one (21)** units of competency, as follows:

- **nine (9)** core units consisting of common and imported units
- **twelve (12)** elective units (chosen in accordance with the unit selection guidelines in Column 4) from the technical stream and imported units in Group A.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	
MEM12001B	Use comparison and basic measuring devices	
MSAENV272B	Participate in environmentally sustainable work practices	

Elective units of competency

Group A

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA240	Use electrical test equipment to perform basic electrical tests	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA301	Perform aircraft flight servicing	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA302	Remove and install aircraft hydro-mechanical and landing gear system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA303	Remove and install aircraft pneumatic system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA304	Remove and install non-pressurised aircraft structural and non-structural components	MEA302	Do not take with MEA317
MEA317	Remove and install pressurised aircraft structural and non-structural components	MEA302, MEA303	Do not take with MEA304
MEA411	Remove surface coatings from aircraft or aircraft components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA412	Pre-treat aluminium alloy surfaces	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA414	Remove light corrosion from aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Do not take with MEA419
MEA416	Apply aircraft identification markings, graphics and decals	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA419	Inspect and repair/modify aircraft cabin/cockpit non-primary structure components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Do not take with MEA414
MEA501	Maintain and fit anti-G suits	MEA101, MEA103	

Unit code	Unit title	Prerequisites	Unit selection guidelines
		MEA105, MEA107 MEA108, MEA109 MEA118, MEA511 MSFSF2002	
MEA502	Maintain and fit helmets	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA240	
MEA503	Maintain and fit immersion suits	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118 LMTTF2008A	
MEA504	Maintain and fit oxygen masks	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA240	
MEA505	Maintain and pack parachutes	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA511 MSFSF2002	
MEA507	Maintain, pack and fit survival inflatable buoyancy vests	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118	
MEA508	Maintain, install and remove restraint systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA511 MSFSF2002	
MEA509	Manufacture, repair and alter	MEA101, MEA103	

Unit code	Unit title	Prerequisites	Unit selection guidelines
	aircraft related fabric components	MEA105, MEA107 MEA108, MEA109 MEA118, MEA511 MSFSF2002	
MEA510	Maintain seat and pod electrical and electronic systems	MEA240	
MEA511	Operate and maintain sewing machines and overlockers		
MEA513	Maintain and pack survival inflatable life rafts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118	
MEA514	Maintain and pack escape slides	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118	
AURVTT2004	Trim vehicle components		Do not take with MSFUP3012
AURVTT2005	Select and apply trim and fabric materials		
AURVTT2006	Select and apply trim and fabric adhesives		Do not take with LMTTF2008A
MSFSF2001	Cut single layer fabrics		
MSFSF2002	Machine sew materials		
MSFUP3012	Apply marine sewing and installation techniques		Do not take with AURVTT2004
LMTTF2008A	Use adhesives		Do not take with AURVTT2006
DEFEO101D	Work safely with explosive ordnance		

Unit code	Unit title	Prerequisites	Unit selection guidelines
DEFEO301D	Package ammunition		
DEFEO302D	Unpackage ammunition		
DEFEO501D	Conduct explosive ordnance inspection		

Qualification Mapping Information

Supersedes and is equivalent to MEA30311 Certificate III in Aircraft Life Support and Furnishing

MEA40615 Certificate IV in Aeroskills (Avionics)

Modification History

Release 2 - Correction to error of unit title in Group A (Aircraft Maintenance Stream)
MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and components.

Qualification Description

This qualification applies to employees of Continuing Airworthiness Management Organisations (CAMOs) or to members of the Australian Defence Force (ADF) who perform scheduled inspections, fault diagnosis and repair, and modification of aircraft electrical, instrument and radio systems and system components.

The qualification defines the exit from an apprenticeship and may apply to either aircraft maintenance performed on flight lines/ramps and in hangars, or to avionic component repair and overhaul performed in workshops. These outcomes are defined in two streams:

- aircraft maintenance stream
- component maintenance workshop stream.

The qualification consists of:

- common units that apply to all Aeroskills specialist streams at Certificate III and IV levels
- avionic technical stream units relating to either aircraft avionic system and component maintenance or to component repair and overhaul
- one mechanical technical stream unit that is applicable to the aircraft maintenance stream
- one imported unit that is applicable to the aircraft maintenance stream.

Because of the wide application of this qualification there is considerable flexibility in the selection of technical stream units and individuals should be mindful of their future career aspirations when selecting units for, in particular, the aircraft maintenance stream. Provided that the correct elective units are selected, the qualification articulates with the Diploma of Aeroskills (Avionics) which qualifies individuals for the grant by the Civil Aviation Safety Authority (CASA) of a B2 Aircraft Maintenance Engineer Licence.

The qualification also provides credits towards the MEA50315 Diploma of Aviation Maintenance Management (Avionics) and the MEA60115 Advanced Diploma of Aviation Maintenance Management (Avionics).

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA40615 Certificate IV in Aeroskills (Avionics) competency must be demonstrated in:

Aircraft Maintenance Stream

- **twelve (12)** core units consisting of common, imported and some avionic technical stream units
- **thirteen (13)** elective technical stream units chosen from Group A
- Total: **twenty-five (25)** units

OR

Component Maintenance Workshop Stream

- **thirteen (13)** core units consisting of common, imported and avionic technical stream units
- **three (3)** elective technical stream units chosen from Group B
- Total: **sixteen (16)** units

Core units of competency (Aircraft Maintenance Stream)

- Complete all **twelve (12)** mandatory common, technical stream and imported units listed below.

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108

Unit code	Unit title	Prerequisites
MEA118	Conduct self in the aviation maintenance environment	
MEA148	Apply mathematics and physics in aviation maintenance	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MSAENV272B	Participate in environmentally sustainable work practices	

Core units of competency (Component Maintenance Workshop Stream)

- Complete all **thirteen (13)** mandatory common, technical stream and imported units listed below.

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108

Unit code	Unit title	Prerequisites
MEA118	Conduct self in the aviation maintenance environment	
MEA148	Apply mathematics and physics in aviation maintenance	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA261	Use electronic test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MSAENV272B	Participate in environmentally sustainable work practices	

Elective units of competency

Group A (Aircraft Maintenance Stream)

- Choose **thirteen (13)** of the technical stream units listed below while observing the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA202	Remove and install basic aircraft electrical system components	MEA201	Do not take with MEA203
MEA203	Remove and install advanced aircraft electrical system components	MEA201	Do not take with MEA202
MEA204	Remove and install basic aircraft instrument system	MEA201	Do not take with

Unit code	Unit title	Prerequisites	Unit selection guidelines
	components		MEA205
MEA205	Remove and install advanced aircraft instrument system components	MEA201	Do not take with MEA204
MEA206	Remove and install aircraft basic radio communication and navigation system components	MEA201	Elective
MEA207	Remove and install aircraft electronic system components	MEA201	Elective
MEA208	Remove and install aircraft pressurisation control system components	MEA201	Elective
MEA209	Remove and install aircraft oxygen system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA210	Inspect, test and troubleshoot basic aircraft electrical systems and components	MEA202, MEA246	Do not take with MEA211 or with MEA223 and MEA227
MEA211	Inspect, test and troubleshoot advanced aircraft electrical systems and components	MEA203, MEA246	Do not take with MEA210 or with MEA223 and MEA227
MEA212	Inspect, test and troubleshoot basic aircraft instrument systems and components	MEA204, MEA246	Do not take with MEA213 or with MEA224 and MEA228
MEA213	Inspect, test and troubleshoot advanced aircraft instrument systems and components	MEA205, MEA246	Do not take with MEA212 or with MEA224 and MEA228
MEA214	Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components	MEA206, MEA246	Do not take with MEA226 and MEA229

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA215	Inspect, test and troubleshoot advanced aircraft communications systems and components	MEA206, MEA246	Do not take with MEA226 and MEA229
MEA216	Inspect, test and troubleshoot instrument landing systems and components	MEA206, MEA207 MEA246	Do not take with MEA226 and MEA229
MEA217	Inspect, test and troubleshoot fixed wing autopilot systems and components	MEA207, MEA246	Take instead of MEA225 and MEA230 if only maintaining 3 axis autopilot system
MEA218	Inspect, test and troubleshoot rotary wing autopilot systems and components	MEA207, MEA246	Take instead of MEA231 if only maintaining an autopilot system
MEA219	Inspect, test and troubleshoot aircraft pressurisation control systems and components	MEA208, MEA246	Do not take with MEA224 and MEA228
MEA220	Inspect, test and troubleshoot aircraft primary radar systems and components	MEA207, MEA246	Do not take with MEA226 and MEA232
MEA221	Inspect, test and troubleshoot aircraft secondary radar systems and components	MEA207, MEA246	Do not take with MEA226 and MEA232
MEA222	Inspect, test and troubleshoot aircraft oxygen systems and components	MEA209	Elective
MEA223	Inspect aircraft electrical systems and components	MEA203, MEA246	Do not take with MEA210 or MEA211
MEA224	Inspect aircraft instrument systems and components	MEA205, MEA246	Do not take with MEA212 or MEA213
MEA225	Inspect fixed wing aircraft automatic flight control systems	MEA207, MEA246	Do not take with

Unit code	Unit title	Prerequisites	Unit selection guidelines
	and components		MEA217
MEA226	Inspect aircraft electronic systems and components	MEA207, MEA246	Do not take with MEA213, MEA214 or MEA215
MEA227	Test and troubleshoot aircraft electrical systems and components	MEA223	Do not take with MEA211
MEA228	Test and troubleshoot aircraft instrument systems and components	MEA224, MEA226	Do not take with MEA212 or MEA213
MEA229	Test and troubleshoot aircraft radio frequency navigation and communications systems and components	MEA226	Do not take with MEA214, MEA215 or MEA216
MEA230	Test and troubleshoot fixed wing aircraft automatic flight control systems and components	MEA225, MEA246	Do not take with MEA217
MEA231	Inspect, test and troubleshoot rotary wing aircraft automatic flight control systems and components	MEA207, MEA246	Do not take with MEA218
MEA232	Test and troubleshoot aircraft pulse systems and components	MEA226, MEA246	Do not take with MEA220 or MEA221
MEA233	Inspect, test and troubleshoot aircraft inertial navigation and reference systems and components	MEA207, MEA246	Do not take with MEA226 and MEA228
MEA234	Inspect, test and troubleshoot aircraft global navigation systems and components	MEA206, MEA207 MEA246	Do not take with MEA226 and MEA229
MEA261	Use electronic test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA262	Modify/repair single layer printed circuit boards	MEA260, MEA261	Do not take with MEA263
MEA263	Modify/repair multi-layer printed circuit boards	MEA260, MEA261	Do not take with MEA262
MEA266	Terminate and repair aircraft optical fibre cable		Elective
MEA278	Inspect, test and troubleshoot instrument display systems and components	MEA207, MEA246	Do not take with MEA226, MEA228
MEA279	Inspect, test and troubleshoot full authority digital engine control systems	MEA207, MEA246	Do not take with MEA230
MEA280	Inspect, test and troubleshoot flight management systems and components	MEA207, MEA246	Elective
MEA301	Perform aircraft flight servicing	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
AVIF3016A	Marshal aircraft		Elective

Group B (Component Maintenance Workshop Stream)

- Choose at least **three (3)** of the Avionic technical stream units listed below while observing the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA252	Test, align and troubleshoot synchro and servo system components	MEA201, MEA260 MEA261	Elective
MEA262	Modify/repair single layer printed circuit boards	MEA260, MEA261	Do not take with MEA263
MEA263	Modify/repair multi-layer	MEA260, MEA261	Do not take with

Unit code	Unit title	Prerequisites	Unit selection guidelines
	printed circuit boards		MEA262
MEA266	Terminate and repair aircraft optical fibre cable		Elective
MEA282	Repair or overhaul aircraft pulse system components	MEA260, MEA261	Elective
MEA283	Repair or overhaul aircraft display, control and distribution system components	MEA260, MEA261	Elective
MEA284	Repair or overhaul aircraft instrument system components	MEA260, MEA261	Elective
MEA285	Repair or overhaul aircraft radio frequency communication and navigation system components	MEA260, MEA261	Elective
MEA286	Repair or overhaul aircraft electrical/electro-mechanical components	MEA201, MEA260	Elective
MEA287	Repair or overhaul aircraft oxygen system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA288	Repair or overhaul aircraft audio and visual systems and reproducers	MEA260, MEA261	Elective

Qualification Mapping Information

Release 2 - Correction of error to unit title MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and components. Equivalent.

Supersedes and is equivalent to MEA40611 Certificate IV in Aeroskills (Avionics)

MEA40715 Certificate IV in Aeroskills (Mechanical)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to employees of Civil Aviation Maintenance Organisations (AMOs) or to members of the Australian Defence Force (ADF) who perform scheduled inspections, fault diagnosis and repair, and modification of airframes and airframe mechanical, hydraulic and pneumatic systems and components, and of aircraft engines and (where applicable) propellers.

The qualification defines the exit from an apprenticeship and may apply to either aircraft maintenance performed on flight lines/ramps and in hangars, or to airframe and engine component repair and overhaul performed in workshops. These outcomes are defined in two streams:

- aircraft maintenance stream
- component maintenance workshop stream.

The qualification consists of:

- common units that apply to all Aeroskills specialist streams at AQF Certificate III and IV levels
- mechanical and structures technical stream units relating to airframe and engine system and component maintenance
- mechanical technical stream units and a small number of avionic stream units that are applicable to the aircraft component maintenance workshop stream.

Because of the wide application of this qualification there is considerable flexibility in the selection of technical stream units and individuals should be mindful of their future career aspirations when selecting units for, in particular, the aircraft maintenance stream. Provided that the correct elective units are selected, the qualification articulates with the MEA50215 Diploma of Aeroskills (Mechanical) which qualifies individuals for the grant by Civil Aviation Safety Authority (CASA) of a B1 Aircraft Maintenance Engineer Licence.

The qualification also provides credit towards the MEA50415 Diploma of Aviation Maintenance Management (Mechanical) and the MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical).

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA40715 Certificate IV in Aeroskills (Mechanical), competency must be demonstrated in:

Aircraft Maintenance Stream

- Core common and imported units: **eight (8)** units
- Elective technical stream units from Group A: **thirteen (13)** units
- Total: **twenty-one (21)** units.

OR

Component Maintenance Workshop Stream

- Core common and imported units: **eight (8)** units
- Elective technical stream units from Groups B and C: **six (6)** units
- Total: **fourteen (14)** units.

Core units of competency (common to both streams)

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	

Unit code	Unit title	Prerequisites
MSAENV272B	Participate in environmentally sustainable work practices	

Elective units of competency

Group A (Aircraft Maintenance Stream)

- Choose **thirteen (13)** of the elective mechanical and structures technical stream units listed below while observing the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260	
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA301	Perform aircraft flight servicing	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA302	Remove and install aircraft hydro-mechanical and landing gear system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA303	Remove and install aircraft pneumatic system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA304	Remove and install non-pressurised aircraft structural and non-structural components	MEA302	Do not take with MEA317

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA305	Remove and install aircraft fixed wing flight control system components	MEA302	
MEA306	Remove and install engines and engine system components	MEA302	
MEA307	Remove and install propeller systems and components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA308	Remove and install rotary wing rotor and flight control system components	MEA302	Alternate to both MEA305 and MEA307
MEA309	Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components	MEA302	Do not take with MEA318 and MEA320
MEA310	Inspect, test and troubleshoot aircraft pneumatic systems and components	MEA303	Do not take with MEA318 and MEA320
MEA312	Inspect, test and troubleshoot aircraft fixed wing flight control systems and components	MEA305	Do not take with MEA318C and MEA321
MEA313	Inspect, test and troubleshoot piston engine systems and components	MEA306	
MEA314	Inspect, test and troubleshoot gas turbine engine systems and components	MEA306	Do not take with MEA319 and MEA322
MEA315	Inspect, test and troubleshoot propeller systems and components	MEA307	
MEA316	Inspect, test and troubleshoot rotary wing rotor and control systems and components	MEA308	Alternative to both of MEA312 and MEA315

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA317	Remove and install pressurised aircraft structural and non-structural components	MEA302 MEA303	Do not take with MEA304
MEA318	Inspect aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components	MEA302, MEA303 MEA305	Do not take with MEA309 or MEA310
MEA319	Inspect gas turbine engine systems and components	MEA306	Do not take with MEA314
MEA320	Test and troubleshoot aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components	MEA318	Do not take with MEA309 or MEA310
MEA321	Test and troubleshoot aircraft fixed wing flight control systems and components	MEA318	Do not take with MEA312
MEA322	Test and troubleshoot gas turbine engine systems and components	MEA319	Do not take with MEA314
MEA327	Fabricate and/or repair aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Do not take with MEA328
MEA328	Maintain and/or repair aircraft mechanical components or parts	MEA302, MEA303	Do not take with MEA327
MEA339	Inspect, repair and maintain aircraft structures	MEA304 or MEA317	Do not take with MEA401 or MEA410
MEA362	Maintain aircraft vapour cycle air conditioning systems	MEA201, MEA246	
MEA366	Perform borescope inspections	MEA313 or MEA314 or MEA322 or MEA388	Additional unit where CASA borescope inspection

Unit code	Unit title	Prerequisites	Unit selection guidelines
			authority required
MEA401	Inspect aircraft structures	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Do not take with MEA311 or MEA339
MEA410	Maintain aircraft structure/components	MEA401	Do not take with MEA339
AVIF3016A	Marshal aircraft		

Groups B and C (Component Workshop Stream)

- Choose at least **three (3)** of the elective technical stream units listed in Group B and make up to a total of **six (6)** units with units from Group C.

Group B

Unit code	Unit title	Prerequisites
MEA380	Repair and/or overhaul aircraft hydraulic system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA381	Repair and/or overhaul aircraft pneumatic system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA382	Repair and/or overhaul aircraft fuel system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA383	Repair and/or overhaul gas turbine engine air inlet and compressor components and/or modules	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA384	Repair and/or overhaul gas turbine engine combustion section components and/or modules	MEA101, MEA103 MEA105, MEA107

		MEA108, MEA109
MEA385	Repair and/or overhaul gas turbine engine turbine and exhaust section components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA386	Repair and/or overhaul gas turbine engine ancillary section components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA387	Test gas turbine engines and engine modules after overhaul or repair	MEA383, MEA384 MEA385, MEA386
MEA389	Repair and/or overhaul propellers	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA390	Repair and/or overhaul rotary wing dynamic components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA391	Repair and/or overhaul aircraft mechanical system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA392	Disassemble aircraft piston engines	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA393	Repair and/or overhaul aircraft piston engine cylinder assembly components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA394	Repair and/or overhaul aircraft piston engine crankcase assembly components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA395	Reassemble aircraft piston engines	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

MEA396	Assemble aircraft piston engine quick engine change unit	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA397	Test aircraft piston engines after repair or overhaul	MEA392, MEA393 MEA394, MEA395 MEA396

Group C

Unit code	Unit title	Prerequisites
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA368	Shot peen aircraft components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEM24002B	Perform penetrant testing	MEM18001C (Note that MEA109 is equivalent) MEM24012C
MEM24004B	Perform magnetic particle testing	MEM18001C (Note that MEA109 is equivalent) MEM24012C
MEM24012C	Apply metallurgy principles	

Qualification Mapping Information

Supersedes and is equivalent to MEA40711 Certificate IV in Aeroskills (Mechanical)

MEA40915 Certificate IV in Aircraft Surface Finishing

Modification History

Release 1 - New qualification

Qualification Description

The qualification applies to employees of aircraft repair and overhaul organisations or members of the Australian Defence Force (ADF) engaged in either the supervision of aircraft surface finishing activities or working in an environment where a significant degree of multi-skilling is required in component removal and installation and/or the performance of a specified range of repair tasks.

The qualification consists of:

- common and imported units that apply to all Aeroskills specialist streams at Certificate III and IV levels
- mandatory surface finishing technical stream and imported units that also apply at Certificate III level
- elective units to be selected according to employment need from listed common units, mechanical and structures technical stream units and an imported unit.

The qualification also provides credits towards the MEA50415 Diploma of Aviation Maintenance Management (Mechanical) and the MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical). A limited number of credits are also provided towards the MEA50215 Diploma of Aeroskills (Mechanical).

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and the Civil Aviation Safety Authority (CASA). Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA40915 Certificate IV in Aircraft Surface Finishing, competency must be demonstrated in **twenty-one (21)** units of competency, as follows:

- **seventeen (17)** core units consisting of common, technical stream and imported units
- **four (4)** elective units chosen from the technical stream and imported units in Group A.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	
MEA411	Remove surface coatings from aircraft or aircraft components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA412	Pre-treat aluminium alloy surfaces	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA413	Seal aircraft and aircraft component structural seams	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA414	Remove light corrosion from aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA415	Paint aircraft surfaces	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Unit code	Unit title	Prerequisites
		AURVTP2003 AURVTP3012
MEA416	Apply aircraft identification markings, graphics and decals	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA417	Apply specialty coatings to aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
AURVTP2003	Prepare spray painting materials and equipment	
AURVTP3012	Apply air dry and polyurethane enamel refinishing materials	
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Elective units of competency

Group A

- Complete at least **four (4)** of the following units selected in accordance with the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA113	Supervise civil aircraft maintenance activities and manage human resources in the workplace	Completion of all applicable Certificate IV units	
MEA116	Apply work health and safety procedures at supervisor level in aviation maintenance		Must be taken if MEA113 or MEA140 selected
MEA140	Supervise maintenance teams and perform maintenance quality inspections	Appointment as an Independent Inspector or Maintenance Quality	(this unit applicable to the ADF regulatory environment)

Unit code	Unit title	Prerequisites	Unit selection guidelines
		Inspector	
MEA240	Use electrical test equipment to perform basic electrical tests		
MEA302	Remove and install aircraft hydro-mechanical and landing gear system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Take with MEA305
MEA305	Remove and install aircraft fixed wing flight control system components	MEA302	
MEA405	Repair/modify aircraft composite material structure/components	MEA401	

Qualification Mapping Information

MEA41015 Certificate IV in Aeroskills (Mechatronics)

Modification History

Release 2 - Qualification Description for MEA41015 revised to comply with CASA licensing requirements. No change to outcomes.

Release 1 - New qualification

Qualification Description

This qualification was aligned with the proposed Civil Aviation Safety Regulation (CASR) Part 66 Manual of Standards (MOS) that was to introduce a new small aircraft licensing system in July 2016. However, CASA decided to hold the revised MOS pending a full review of CASR Part 66 which is intended to take about two years to complete. Until CASA decides on the final form of small aircraft licensing it will not be possible to use this qualification as a pathway to grant of licence.

Until the CASA review is finalised the qualification can be used for small aircraft maintenance apprenticeships and will provide most of the knowledge required for the Basic Examinations which will continue to be the avenue to licensing for small aircraft maintenance.

The qualification applies to individuals involved in the maintenance of small aircraft within the General Aviation industry sector and is not a pathway to the grant of a B1 or B2 Licence for regular public transport aircraft maintained by a Civil Aviation Safety Regulation (CASR) Part 145 Maintenance Repair Organisation (MRO). The pathways to these licences are the MEA50215 Diploma of Aeroskills (Mechanical) for the B1 or the MEA50115 Diploma of Aeroskills (Avionics) for the B2. A number of units in this qualification would provide credits towards those qualifications and towards other qualifications at Certificate IV, Diploma and Advanced Diploma levels.

More information regarding the operation of the MEA Aeroskills Training Package in licence-related areas during the CASR Part 66 review can be found in the Companion Volume –Interface with CASA Licensing Requirements.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA41015 Certificate IV in Aeroskills (Mechatronics) competency must be demonstrated in **thirty (30)** units, as follows:

- **seventeen (17)** core common, technical stream and imported units that are applicable to all B1 and B2 Licences that are limited to release to service of basic small aircraft
- **thirteen (13)** elective Group A technical stream units where a limited B1.1 Licence is sought
- **ten (10)** elective Group B technical stream units where a limited B1.2 Licence is sought
- **eleven (11)** elective Group C technical stream units where a limited B1.3 Licence is sought
- **ten (10)** elective Group D technical stream units where a limited B1.4 Licence is sought
- **nine (9)** elective Group E technical stream units where a limited B2 Licence is sought
- elective Group F technical stream units chosen according to the requirements of the aircraft types being maintained to bring the total unit count to **thirty (30)** units.

Core units of competency

- All **seventeen (17)** units must be taken if a B1 or B2 Licence applicable to basic small aircraft maintenance is being sought.

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA111	Perform administrative processes to prepare for certification of civil aircraft maintenance	All applicable Certificate IV units

MEA112	Plan and implement civil aircraft maintenance activities	All applicable Certificate IV units
MEA113	Supervise civil aircraft maintenance activities and manage human resources in the workplace	All applicable Certificate IV units
MEA116	Apply work health and safety procedures at supervisor level in aviation maintenance	
MEA118	Conduct self in the aviation maintenance environment	
MEA148	Apply mathematics and physics in aviation maintenance	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA301	Perform aircraft flight servicing	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Elective units of competency

Group A

- All **thirteen (13)** units must be taken if a B1.1 Licence applicable to basic small aircraft maintenance is being sought.

Unit code	Unit title	Prerequisites
MEA274	Maintain basic light aircraft electrical systems and components	MEA246

MEA275	Maintain basic light aircraft instrument systems and components	MEA246
MEA276	Maintain basic light aircraft communication and radio navigation systems and components	MEA246
MEA306	Remove and install engines and engine system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA307	Remove and install propeller systems and components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA314	Inspect, test and troubleshoot gas turbine engine systems and components	MEA306
MEA315	Inspect, test and troubleshoot propeller systems and components	MEA307
MEA351	Maintain airframe systems of basic light fixed wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA364	Maintain and/or repair small aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA365	Assess structural repair/modification requirements and evaluate structural repairs and modifications	All Cert IV units listed for applicable licence
MEA369	Inspect and maintain structure and related components of non-pressurised small aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA370	Repair the structure of non-pressurised small aircraft	MEA369
MEA372	Perform mechanical elementary maintenance	MEA301

Group B

- All ten (10) units must be taken if a B1.2 Licence applicable to basic small aircraft maintenance is being sought.

Unit code	Unit title	Prerequisites
MEA274	Maintain basic light aircraft electrical systems and components	MEA246
MEA275	Maintain basic light aircraft instrument systems and components	MEA246
MEA276	Maintain basic light aircraft communication and radio navigation systems and components	MEA246
MEA351	Maintain airframe systems of basic light fixed wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA353	Maintain basic light aircraft engines and propellers	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA364	Maintain and/or repair small aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA365	Assess structural repair/modification requirements and evaluate structural repairs and modifications	All Cert IV units listed for applicable licence
MEA369	Inspect and maintain structure and related components of non-pressurised small aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA370	Repair the structure of non-pressurised small aircraft	MEA369
MEA372	Perform mechanical elementary maintenance	MEA301

Group C

- All **eleven (11)** units must be taken if a B1.3 Licence applicable to basic small aircraft maintenance is being sought.

Unit code	Unit title	Prerequisites
MEA274	Maintain basic light aircraft electrical systems and components	MEA246

MEA275	Maintain basic light aircraft instrument systems and components	MEA246
MEA276	Maintain basic light aircraft communication and radio navigation systems and components	MEA246
MEA306	Remove and install engines and engine system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA314	Inspect, test and troubleshoot gas turbine engine systems and components	MEA306
MEA352	Maintain basic rotary wing aircraft systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA364	Maintain and/or repair small aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA365	Assess structural repair/modification requirements and evaluate structural repairs and modifications	All Cert IV units listed for applicable licence
MEA369	Inspect and maintain structure and related components of non-pressurised small aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA370	Repair the structure of non-pressurised small aircraft	MEA369
MEA372	Perform mechanical elementary maintenance	MEA301

Group D

- All **ten (10)** units must be taken if a B1.4 Licence applicable to basic small aircraft maintenance is being sought.

Unit code	Unit title	Prerequisites
MEA274	Maintain basic light aircraft electrical systems and components	MEA246
MEA275	Maintain basic light aircraft instrument systems and components	MEA246

MEA276	Maintain basic light aircraft communication and radio navigation systems and components	MEA246
MEA352	Maintain basic rotary wing aircraft systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA353	Maintain basic light aircraft engines and propellers	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA364	Maintain and/or repair small aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA365	Assess structural repair/modification requirements and evaluate structural repairs and modifications	All Cert IV units listed for applicable licence
MEA369	Inspect and maintain structure and related components of non-pressurised small aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA370	Repair the structure of non-pressurised small aircraft	MEA369
MEA372	Perform mechanical elementary maintenance	MEA301

Group E

- All **nine (9)** units must be taken if a B2 Licence applicable to basic small aircraft maintenance is being sought.

Unit code	Unit title	Prerequisites
MEA202	Remove and install basic aircraft electrical system components	MEA201
MEA204	Remove and install basic aircraft instrument system components	MEA201
MEA207	Remove and install aircraft electronic system components	MEA201
MEA210	Inspect, test and troubleshoot basic aircraft electrical systems and components	MEA202, MEA246

MEA212	Inspect, test and troubleshoot basic aircraft instrument systems and components	MEA204, MEA246
MEA216	Inspect, test and troubleshoot instrument landing systems and components	MEA206, MEA207 MEA246
MEA289	Maintain basic light aircraft avionic systems and components	MEA246
MEA290	Fit avionic modification sheet metal components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA291	Inspect, test and troubleshoot fixed wing single axis autopilot systems and components (Refer to Group F – MEA217 or MEA218 may be taken instead of this unit)	MEA207, MEA246

Group F

- Except for the B1.1 Licence, take between **two (2)** and **four (4)** of the listed units as required by the aircraft types being maintained and the unit selection guidelines in column 4 to bring the total unit count to **thirty (30)** units.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA202	Remove and install basic aircraft electrical system components	MEA201	Applicable to electrical retractable undercarriage
MEA206	Remove and install aircraft basic radio communication and navigation system components	MEA201	Includes HF radio
MEA210	Inspect, test and troubleshoot basic aircraft electrical systems and components	MEA202, MEA246	Applicable to electrical retractable undercarriage
MEA214	Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components	MEA206, MEA246	Includes HF radio

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA216	Inspect, test and troubleshoot instrument landing systems and components	MEA206, MEA207 MEA246	Required for ILS
MEA217	Inspect, test and troubleshoot fixed wing autopilot systems and components	MEA207, MEA246	Required for 3 axis autopilot system – may be taken instead of Group E unit MEA291A
MEA218	Inspect, test and troubleshoot rotary wing autopilot systems and components	MEA207, MEA246	Required for helicopter autopilot system
MEA220	Inspect, test and troubleshoot aircraft primary radar systems and components	MEA207, MEA246	Applicable to weather radar
MEA221	Inspect, test and troubleshoot aircraft secondary radar systems and components	MEA207, MEA246	Covers RADALT, DME, Doppler and ACAS
MEA277	Maintain twin engine aircraft electrical systems and components	MEA210	Mandatory for maintenance of light twin piston engine aircraft
MEA278	Inspect, test and troubleshoot instrument display systems and components	MEA207, MEA246	Applicable to electronic display systems
MEA279	Inspect, test and troubleshoot piston engine full authority digital engine control systems	MEA207, MEA246	Required for FADEC system maintenance
MEA281	Maintain light aircraft AC powered instrument systems and components	MEA246	
MEA302	Remove and install aircraft hydro-mechanical and landing gear system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Applicable to hydraulic retractable undercarriage and systems with engine driven pump

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA303	Remove and install aircraft pneumatic system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Applicable to aircraft types with air cycle air conditioning and pressurisation
MEA306	Remove and install engines and engine system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Applicable to piston and gas turbine engines
MEA307	Remove and install propeller systems and components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Covers variable pitch and constant speed propellers
MEA308	Remove and install rotary wing rotor and flight control system components	MEA302	Applicable if helicopter has powered flight controls
MEA309	Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components	MEA302	Applicable to hydraulic retractable undercarriage and systems with engine driven pump
MEA310	Inspect, test and troubleshoot aircraft pneumatic systems and components	MEA303	Applicable to aircraft types with air cycle air conditioning and pressurisation
MEA313	Inspect, test and troubleshoot piston engine systems and components	MEA306 (deemed to be covered if MEA353 is held)	Covers turbo and supercharged engines
MEA314	Inspect, test and troubleshoot gas turbine engine systems and components	MEA306	For gas turbine engine maintenance
MEA315	Inspect, test and troubleshoot propeller systems and components	MEA307	Covers variable pitch and constant speed propellers
MEA316	Inspect, test and troubleshoot rotary wing rotor and control	MEA308	Applicable if helicopter has powered flight

Unit code	Unit title	Prerequisites	Unit selection guidelines
	systems and components		controls
MEA325	Weigh aircraft and perform aircraft weight and balance calculations as a result of modifications	All applicable Certificate IV units	Elective
MEA351	Maintain airframe systems of basic light fixed wing aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective if not required by choice of Group A to E
MEA352	Maintain basic rotary wing aircraft systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective if not required by choice of Group A to E
MEA353	Maintain basic light aircraft engines and propellers	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective if not required by choice of Group A to E
MEA354	Maintain light aircraft pneumatic systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA355	Maintain light aircraft air cycle air conditioning systems	MEA201, MEA246	Elective
MEA356	Maintain light piston engine aircraft pressurisation systems	MEA201, MEA246	Elective
MEA357	Inspect, test and repair aircraft fabric surfaces	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Required for aircraft with fabric surfaces
MEA358	Re-cover aircraft fabric surfaces		Elective
MEA359	Inspect and repair aircraft wooden structures	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Required for aircraft with wooden structure
MEA360	Maintain aircraft diesel engines	MEA353	Required for aircraft types with two or four stroke diesel engines
MEA361	Maintain aircraft two stroke	MEA353	Required for aircraft

Unit code	Unit title	Prerequisites	Unit selection guidelines
	petrol engines		types with two stroke petrol engines
MEA362	Maintain aircraft vapour cycle air conditioning systems	MEA201, MEA246	Elective
MEA367	Repair/modify aircraft composite structure using cold bonding	MEA369	Required for repairs to composite primary or secondary structure using cold bonding only
MEA371	Perform major repairs and modifications to small aircraft metal structure	MEA369, MEA370	Elective
MEA372	Perform mechanical elementary maintenance	MEA301	Required for B2 licence holders to perform mechanical elementary maintenance
MEA405	Repair/modify aircraft composite material structure/components	MEA401 (deemed to be covered if MEA369 is held)	Required for repairs to composite primary or secondary structure using hot or cold bonding
MEA512	Maintain general aviation recovery devices with ballistic parachute systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 DEFEO101D	Elective
DEFEO101D	Work safely with explosive ordnance		Elective

Qualification Mapping Information

Release 2 - Qualification Description for MEA41015 revised to comply with CASA licensing requirements. No change to outcomes.

Release 1 - Supersedes and is equivalent to MEA41011 Certificate IV in Aeroskills (Mechatronics)

Links

Companion Volume implementation guides are found in VETNet -

MEA41115 Certificate IV in Aircraft Life Support and Furnishing

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to members of the Australian Defence Force (ADF) and to employees of Civil Aviation Maintenance Organisations (AMOs) who work at supervisor or team leader levels on the maintenance of aircraft and personal life support equipment and on the fabrication and maintenance of aircraft furnishings.

The qualification consists of:

- mandatory common units that apply to all Aeroskills qualifications at Certificate III and IV levels and elective common units that relate to the regulatory system within which individuals are employed
- elective technical stream units and imported units.

The qualification provides a number of credits towards other Aeroskills qualifications at Certificate III and IV levels and a limited number of credits towards a Diploma or Advanced Diploma of Aviation Maintenance Management.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and the Civil Aviation Safety Authority (CASA). Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA41115 Certificate IV in Aircraft Life Support and Furnishing, competency must be demonstrated in **twenty-six (26)** units of competency, as follows:

- **ten (10)** core common and imported units
- **one (1)** elective unit from the common units listed in Group A
- **fifteen (15)** elective units from the technical stream and imported units listed in Group B.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA115	Plan and implement aeronautical product maintenance activities	
MEA116	Apply work health and safety procedures at supervisor level	
MEA118	Conduct self in the aviation maintenance environment	
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Elective units of competency

Group A

- Complete at least **one (1)** of the following two units chosen in accordance with the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisite	Unit selection guidelines

Unit code	Unit title	Prerequisite	Unit selection guidelines
MEA114	Certify aeronautical product maintenance	All Cert IV units applicable to the tasks	Applicable to those working under CASA Airworthiness Regulations
MEA140	Supervise aviation maintenance teams and perform maintenance quality inspections	Appointment as an MQI or Independent Inspector	Applicable to those working under ADF Airworthiness Regulations

Group B

- Complete **fifteen (15)** of the technical stream and imported units listed below; selected in accordance with the prerequisites in column 3 and the unit selection criteria in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA240	Use electrical test equipment to perform basic electrical tests	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA302	Remove and install aircraft hydro-mechanical and landing gear system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA303	Remove and install aircraft pneumatic system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA304	Remove and install non-pressurised aircraft structural and non-structural components	MEA302	Elective – do not take with MEA317
MEA317	Remove and install pressurised aircraft structural and non-structural components	MEA302, MEA303	Elective – do not take with MEA304

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA411	Remove surface coatings from aircraft or aircraft components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA412	Pre-treat aluminium alloy surfaces	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA414	Remove light corrosion from aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective – do not take with MEA419
MEA416	Apply aircraft identification markings, graphics and decals	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA419	Repair/modify aircraft cabin/cockpit non-primary structure components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective – do not take with MEA414
MEA501	Maintain and fit anti-G suits	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MSFSF2002	Elective
MEA502	Maintain and fit helmets	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA240	Elective
MEA503	Maintain and fit immersion suits	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118 LMTTF2008A	Elective

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA504	Maintain and fit oxygen masks	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA240	Elective
MEA505	Maintain and pack parachutes	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA511 MSFSF2002	Elective
MEA507	Maintain, pack and fit survival inflatable buoyancy vests	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118	Elective
MEA508	Maintain, install and remove restraint systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA511 MSFSF2002	Elective
MEA509	Manufacture, repair and alter aircraft related fabric components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118, MEA511 MSFSF2002	Elective
MEA510	Maintain seat and pod electrical and electronic systems	MEA240	Elective
MEA511	Operate and maintain sewing machines and overlockers		Elective
MEA513	Maintain and pack survival inflatable life rafts	MEA101, MEA103 MEA105, MEA107	Elective

Unit code	Unit title	Prerequisites	Unit selection guidelines
		MEA108, MEA109 MEA118	
MEA514	Maintain and pack escape slides	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 MEA118	Elective
AURVTT2004	Trim vehicle components		Elective – do not take with MSFUP3012
AURVTT2005	Select and apply trim and fabric materials		Elective
AURVTT2006	Select and apply trim and fabric adhesives		Elective - do not take with LMTTF2008A
DEFEO101D	Work safely with explosive ordnance		Elective
DEFEO501D	Conduct explosive ordnance inspection		Elective
LMTTF2008A	Use adhesives		Elective – do not take with AURVTT2006
MEM12001B	Use comparison and basic measuring devices		Mandatory
MSFSF2001	Cut single layer fabrics		Elective
MSFSF2002	Machine sew materials		Elective
MSFUP3012	Apply marine sewing and installation techniques		Elective – do not take with AURVTT2004

Qualification Mapping Information

Supersedes and is equivalent to MEA41111 Certificate IV in Aircraft Life Support and Furnishing

MEA41215 Certificate IV in Aeroskills (Armament)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to members of the Australian Defence Force (ADF) who perform scheduled inspections, fault diagnosis and repair, and modification of aircraft egress, stores management and stores suspension systems and system components, and maintenance of guided weapons. It should be noted that employment in this field also involves the attainment of a range of competencies in the explosive ordnance field. The explosive ordnance units of competency are in the DEF12 Defence Training Package and in the TLI10 Transport and Logistics Training Package and are not included in this qualification other than five units dealing with safe handling of explosive ordnance that are required for the maintenance of egress systems and cartridge operated fire extinguishing systems in aircraft.

The qualification defines the exit from training and may apply to aircraft maintenance performed on flight lines and in hangars/workshops.

The qualification consists of:

- common units that apply to all Aeroskills specialist streams at Certificate III and IV levels
- avionic technical stream units relating to aircraft system and component maintenance
- one mechanical technical stream unit
- armament technical stream units
- imported units.

The qualification provides a number of credits towards other Aeroskills Certificate IV qualifications and towards the MEA50315 Diploma of Aviation Maintenance Management (Avionics) and the MEA60115 Advanced Diploma of Aviation Maintenance Management (Avionics).

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and the Civil Aviation Safety Authority (CASA). Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

ADF Armament trainees

Packaging Rules

To be awarded the MEA41215 Certificate IV in Aeroskills (Armament), competency must be demonstrated in **twenty (20)** units of competency, as follows:

- **thirteen (13)** core units consisting of common, imported and technical stream units
- **seven (7)** elective units consisting of imported and technical stream units selected from electives Group A.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA261	Use electronic test equipment	MEA101, MEA103 MEA105, MEA107

Unit code	Unit title	Prerequisites
		MEA108, MEA109
MSAENV272B	Participate in environmentally sustainable work practices	
DEFEO101D	Work safely with explosive ordnance	

Elective units of competency

Group A

- Complete **seven (7)** of the listed imported and technical stream units while observing the unit prerequisite requirements.

Unit code	Unit title	Prerequisites
MEA203	Remove and install advanced aircraft electrical system components	MEA201
MEA211	Inspect, test and troubleshoot advanced aircraft electrical systems and components	MEA203, MEA246
MEA301	Perform aircraft flight servicing	MEA101, MEA103 MEA104, MEA107 MEA108, MEA109
MEA601	Maintain aircraft egress systems	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 DEFEO101D
MEA602	Remove and install aircraft stores management system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 DEFEO101D
MEA603	Remove and install aircraft stores suspension systems and components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109 DEFEO101D
MEA604	Inspect, test and troubleshoot aircraft stores management systems and components	MEA602

Unit code	Unit title	Prerequisites
MEA605	Inspect, test and troubleshoot aircraft stores suspension systems and components	MEA603
AVIF3016A	Marshal aircraft	
DEFEO301D	Package ammunition	
DEFEO302D	Unpackage ammunition	
DEFEO501D	Conduct explosive ordnance inspection	
DEFEO718C	Maintain cartridge operated fire extinguishing systems	

Qualification Mapping Information

Supersedes and is equivalent to MEA41213 Certificate IV in Aeroskills (Armament)

MEA41315 Certificate IV in Aeroskills (Structures)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to employees of Civil Aviation Maintenance Organisations (AMOs) or to members of the Australian defence Force (ADF) who are engaged in the repair and modification of aircraft structures. The qualification defines the exit from apprenticeship and may apply to work performed in hangars on the structure of complete aircraft and to work performed in workshops on structural components.

The training pathways provide for work on both metal and composite structures. In some cases, primarily in the General Aviation sector, individuals may be also required to work on aircraft with wooden structures and/or fabric coverings. The applicable competencies are covered in the units MEA357 Inspect, test and repair aircraft fabric surfaces, MEA358 Re-cover aircraft fabric surfaces and MEA359 Inspect and repair aircraft wooden structures.

The qualification consists of:

- common and imported units that apply to all Aeroskills specialist streams at AQF Certificate III and IV levels
- mandatory structures technical stream units
- elective mechanical technical stream units that provide a degree of multi-skilling where needed to meet workplace requirements
- elective structures technical stream and imported units required to meet workplace needs.

The qualification also provides credits towards the MEA50415 Diploma of Aviation Maintenance Management (Mechanical) and the MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical). A limited number of credits are also provided towards the MEA50215 Diploma of Aeroskills (Mechanical).

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and the Civil Aviation Safety Authority (CASA). Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA41315 Certificate IV in Aeroskills (Structures), competency must be demonstrated in **nineteen (19)** units of competency, as follows:

- **fourteen (14)** core units consisting of common, imported and technical stream units
- **five (5)** elective technical stream units from Group A.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	
MEA327	Fabricate and/or repair aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA401	Inspect aircraft structures	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA420	Fabricate basic structural components for aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Unit code	Unit title	Prerequisites
MEA421	Fabricate advanced structural components for aircraft	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA422	Repair/modify aircraft metal structure	MEA401
MEA423	Aircraft structure major disassembly and reassembly	MEA401
MSAENV272B	Participate in environmentally sustainable work practices	

Elective units of competency

Group A

- Select **five (5)** units while observing the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA302	Remove and install aircraft hydro-mechanical and landing gear system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA303	Remove and install aircraft pneumatic system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA304	Remove and install non-pressurised aircraft structural and non-structural components	MEA302	Elective
MEA305	Remove and install aircraft fixed wing flight control system components	MEA302	Elective
MEA308	Remove and install rotary wing rotor and flight control system	MEA302	Elective

Unit code	Unit title	Prerequisites	Unit selection guidelines
	components		
MEA317	Remove and install pressurised aircraft structural and non-structural components	MEA302 MEA303	Elective
MEA367	Repair/modify aircraft composite structure using cold bonding	MEA401	Take this unit or MEA405
MEA405	Repair/modify aircraft composite material structure/components	MEA401	Alternate to MEA367
MEA410	Maintain aircraft structure/components	MEA401	Elective
MEA411	Remove surface coatings from aircraft or aircraft components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Elective
MEA425	Perform bolted composite skin repairs	MEA401	Elective
AVIF3016A	Marshal aircraft		Elective
MEM06003C	Carry out heat treatment		Elective

Qualification Mapping Information

Supersedes and is equivalent to MEA41311 Certificate IV in Aeroskills (Structures)

MEA50115 Diploma of Aeroskills (Avionics)

Modification History

Release 1 - New qualification

Qualification Description

The qualification applies to individuals seeking the grant of a Civil Aviation Safety Authority (CASA) B2 Aircraft Maintenance Engineer Licence covering the supervision, performance and certification of avionic maintenance on aircraft that are type-rated by CASA for maintenance purposes.

The qualification satisfies CASA requirements for the grant, under Civil Aviation Safety Regulation (CASR) Part 66, of Aircraft Maintenance Engineer Licence B2 when the skills and knowledge requirements align with CASA syllabus requirements in the Companion Volume CASA Interface and training has been delivered in accordance with the requirements of CASR Part 147. It consists of:

- common and technical stream units required at Certificate IV level in the aircraft maintenance stream
- additional Diploma level common and imported units that cover supervisor level work health and safety (WHS) competency plus competencies required by CASA for the exercise of licence privileges
- Diploma level avionic technical stream units covering advanced fault diagnosis and aircraft weight and balance calculation.

Credits are also provided towards the MEA50315 Diploma of Aviation Maintenance Management (Avionics) and the MEA60115 Advanced Diploma of Aviation Maintenance Management (Avionics).

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA50115 Diploma of Aeroskills (Avionics) competency must be demonstrated in **thirty-two (32)** or **thirty-three (33)** units of competency, depending on the choice of elective specialist units. These units consist of:

- **eight (8)** core Diploma level (CASA licensing) units
- **twenty-three (23)** core common and technical stream units from Certificate IV that are mandatory for a CASA B2 Licence

- either elective Group A (**two (2)** units) or Group B (**one (1)** unit).

Core units of competency

- Complete all **eight (8)** of the Diploma level common, imported and avionic technical stream units listed below.

Unit code	Unit title	Prerequisites
MEA111	Perform administrative processes to prepare for the certification of civil aircraft maintenance	All Cert IV units listed below (See Note 1)
MEA112	Plan and implement civil aircraft maintenance activities	All Cert IV units listed below (see Note 1)
MEA113	Supervise civil aircraft maintenance activities and manage human resources in the workplace	All Cert IV units listed below (see Note 1)
MEA116	Apply work health and safety procedures at supervisor level in aviation maintenance	
MEA142	Manage self in the aviation maintenance environment	
MEA235	Perform advanced troubleshooting in aircraft avionic maintenance	All Cert IV units listed below (see Note 1)
MEA241	Perform aircraft weight and balance calculations as a result of modifications	All Cert IV units listed below (see Note 1)
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Note 1: While the units do not have specific prerequisite units it is a CASA licensing requirement that competency not be sought until all of the Certificate IV units listed below have been attained.

- Plus the **twenty-three (23)** Certificate IV common and avionic/mechanical technical stream units listed below.

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	
MEA148	Apply mathematics and physics in aviation maintenance	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA203	Remove and install advanced aircraft electrical system components	MEA201
MEA205	Remove and install advanced aircraft instrument system components	MEA201
MEA206	Remove and install aircraft basic radio communication and navigation system components	MEA201
MEA207	Remove and install aircraft electronic system components	MEA201
MEA223	Inspect aircraft electrical systems and components	MEA203, MEA246
MEA224	Inspect aircraft instrument systems and components	MEA205, MEA246
MEA226	Inspect aircraft electronic systems and components	MEA207, MEA246

Unit code	Unit title	Prerequisites
MEA227	Test and troubleshoot aircraft electrical systems and components	MEA223
MEA228	Test and troubleshoot aircraft instrument systems and components	MEA224, MEA226
MEA229	Test and troubleshoot aircraft radio frequency navigation and communications systems and components	MEA226
MEA232	Test and troubleshoot aircraft pulse systems and components	MEA226, MEA246
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA301	Perform aircraft flight servicing	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Elective units of competency

Plus specialist elective units from Group A or Group B as defined below.

Group A

- Complete the **two (2)** units listed.

Unit code	Unit title	Prerequisites
MEA225	Inspect fixed wing aircraft automatic flight control systems and components	MEA207, MEA246
MEA230	Test and troubleshoot fixed wing aircraft automatic flight control systems and components	MEA225, MEA246

Group B

- Complete the **one (1)** unit listed.

Unit code	Unit title	Prerequisites
MEA231	Inspect, test and troubleshoot rotary wing aircraft automatic flight control systems and components	MEA207, MEA246

Qualification Mapping Information

Supersedes and is equivalent to MEA50111 Diploma of Aeroskills (Avionics)

MEA50215 Diploma of Aeroskills (Mechanical)

Modification History

Release 2 - Total number of core Certificate IV units required for B1 Licence sub-categories corrected from 18 to 17.

Release 1 - New qualification

Qualification Description

The qualification applies to individuals seeking the grant of a Civil Aviation Safety Authority (CASA) B1 Aircraft Maintenance Engineer Licence covering the supervision, performance and certification of airframe, engine, electrical and structural maintenance on aircraft that are type-rated by CASA for maintenance purposes.

The requirement for the awarding of MEA50215 Diploma of Aeroskills (Mechanical) is demonstrated competency in listed units of competency under the conditions set out below. The listed units also satisfy CASA requirements for the grant, under Civil Aviation Regulation (CASR) Part 66, of Aircraft Maintenance Engineer B1 Licences in sub-categories B1.1 and B1.3 when the skills and knowledge requirements align with CASA syllabus requirements in the Companion Volume and CASA Interface and training has been delivered in accordance with the requirements of CASR Part 147.

The qualification consists of:

- common and technical stream units required at Certificate IV level in the aircraft maintenance stream with electives determined by the desired licence sub-category
- additional Diploma level common units that cover supervisor level work health and safety (WHS) competency plus competencies required by CASA for the exercise of licence privileges
- Diploma level mechanical technical stream units covering advanced fault diagnosis and aircraft weighing and weight and balance calculation.

The qualification also provides credits towards the MEA50415 Diploma of Aviation Maintenance Management (Mechanical) and the MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical).

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA50215 Diploma of Aeroskills (Mechanical) competency must be demonstrated in **thirty-six (36) to forty-three (43)** units, chosen as described below.

All B1 Licence sub-categories require the following twenty-eight (28) units:

- **eleven (11)** core Diploma level (CASA licensing) common, technical stream and imported units
- **seventeen (17)** core Certificate IV common and technical stream units.

Depending on the CASA B1 Licence sub-category being sought, an additional **eight (8) to fifteen (15)** units are required, up to a maximum of **forty-three (43)** units for the qualification. All units must be chosen as specified under the conditions set out below:

- Group A elective technical stream units required by CASA for a B1.1 Licence – **thirteen (13) or fifteen (15)** units
- Group B elective technical stream units required by CASA for a B1.3 Licence – **eight (8)** units.

Core units of competency

- Complete the **eleven (11)** Diploma level common and mechanical technical stream units listed below.

Unit code	Unit title	Prerequisites
MEA111	Perform administrative processes to prepare for the certification of civil aircraft maintenance	All Cert IV units listed below for applicable licence (see Note 1)
MEA112	Plan and implement civil aircraft maintenance activities	All Cert IV units listed below for applicable licence (see Note 1)
MEA113	Supervise civil aircraft maintenance activities and manage human resources in the workplace	All Cert IV units listed below for applicable licence (see Note 1)
MEA116	Apply work health and safety procedures at supervisor level in aviation maintenance	

Unit code	Unit title	Prerequisites
MEA142	Manage self in the aviation maintenance environment	
MEA148	Apply mathematics and physics in aviation maintenance	
MEA323	Perform advanced troubleshooting in aircraft mechanical maintenance	All Cert IV units listed below for applicable licence (see Note 1)
MEA325	Weigh aircraft and perform aircraft weight and balance calculations as a result of modifications	All Cert IV units listed below for applicable licence (see Note 1)
MEA343	Remove and install avionic system components	MEA211 or MEA227
MEA365	Assess structural repair/modification requirements and evaluate structural repairs and modifications	All Cert IV units listed below for applicable licence (see Note 1)
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Note 1: While the units do not have specific prerequisite units it is a CASA licensing requirement that competency not be sought until all of the Certificate IV units listed below for the applicable licence have been attained.

- Plus the following **seventeen (17)** core Certificate IV common and avionic/mechanical technical stream units listed below which are mandatory for both B1.1 and B1.3 Licence sub-categories.

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108

Unit code	Unit title	Prerequisites
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA118	Conduct self in the aviation maintenance environment	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA203	Remove and install advanced aircraft electrical system components	MEA201
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA301	Perform aircraft flight servicing	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA302	Remove and install aircraft hydro-mechanical and landing gear system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA303	Remove and install aircraft pneumatic system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA306	Remove and install engines and engine system components	MEA302
MEA328	Maintain and/or repair aircraft mechanical components or parts	MEA302, MEA303

Unit code	Unit title	Prerequisites
MEA339	Inspect, repair and maintain aircraft structures	MEA304 or MEA317

Elective units of competency

Group A

- To meet the criteria for the grant of a B1.1 Licence complete **thirteen (13)** or **fifteen (15)** units listed below as specified in the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA208	Remove and install pressurisation control system components	MEA201	
MEA209	Remove and install aircraft oxygen system components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	
MEA219	Inspect, test and troubleshoot pressurisation control systems and components	MEA208 MEA246	
MEA222	Inspect, test and troubleshoot aircraft oxygen systems and components	MEA209	
MEA223	Inspect aircraft electrical systems and components	MEA203, MEA246	
MEA227	Test and troubleshoot aircraft electrical systems and components	MEA223	
MEA305	Remove and install aircraft fixed wing flight control system components	MEA302	
MEA307	Remove and install propeller systems and components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109	Mandatory for B1.1 where the rating sought

Unit code	Unit title	Prerequisites	Unit selection guidance
			includes propellers
MEA315	Inspect, test and troubleshoot propeller systems and components	MEA307	Mandatory unit for B1.1 where the rating sought includes propellers
MEA317	Remove and install pressurised aircraft structural and non-structural components	MEA302, MEA303	
MEA318	Inspect aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components	MEA302, MEA303 MEA305	
MEA319	Inspect gas turbine engine systems and components	MEA306	
MEA320	Test and troubleshoot aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components	MEA318	
MEA321	Test and troubleshoot aircraft fixed wing flight control systems and components	MEA318	
MEA322	Test and troubleshoot gas turbine engine systems and components	MEA319	

Group B

- To meet the criteria for the grant of a B1.3 Licence complete **eight (8)** units listed below.

Unit code	Unit title	Prerequisites
MEA211	Inspect, test and troubleshoot advanced aircraft electrical systems and components	MEA203, MEA246
MEA304	Remove and install non-pressurised aircraft structural and	MEA302

Unit code	Unit title	Prerequisites
	non-structural components	
MEA308	Remove and install rotary wing rotor and flight control system components	MEA302
MEA309	Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components	MEA302
MEA310	Inspect, test and troubleshoot aircraft pneumatic systems and components	MEA303
MEA316	Inspect, test and troubleshoot rotary wing rotor and control systems and components	MEA308
MEA319	Inspect gas turbine engine systems and components	MEA306
MEA322	Test and troubleshoot gas turbine engine systems and components	MEA319

Qualification Mapping Information

This qualification supersedes and is equivalent to MEA50211 with regard to eligibility for the grant of B1.1 and B1.3 Licences.

MEA50315 Diploma of Aviation Maintenance Management (Avionics)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed in aviation maintenance management fields in both the Civil Aviation Safety Authority (CASA) and Australian Defence Force (ADF) regulatory environments in jobs such as avionic maintenance team leaders, maintenance planners, spares assessors, repairable item managers and technical authors. It must be emphasised that many of the maintenance management positions applicable to the qualification have additional experience requirements specified in airworthiness regulations and only a limited range of employment opportunities may be available to those who do not have extensive prior aviation maintenance experience. For this reason the qualification has entry requirements.

The qualification consists of:

- eleven (11) core units that provide competencies applicable to aviation maintenance managers
- one (1) or (2) elective units chosen according to employment need.

Credit is provided towards the MEA60115 Advanced Diploma of Aviation Maintenance Management (Avionics).

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Individuals seeking this qualification must meet at least one of the following entry criteria:

- at least five years current aviation avionic maintenance experience
- Maintenance Engineer Licence (Avionics) issued by CASA
- Certificate IV in Aeroskills (Avionics).

Packaging Rules

To be awarded the MEA50315 Diploma of Aviation Maintenance Management (Avionics), competency must be demonstrated in a total of **twelve (12)** or **thirteen (13)** units of competency.

All units must be chosen as specified under the conditions set out below:

- **eleven (11)** core Diploma level common, engineering and imported units
- **one (1)** or **two (2)** elective Diploma level common units from Group A.

Core units of competency

- Complete the following **five (5)** common Diploma units, **five (5)** paraprofessional engineering units and **one (1)** imported sustainability unit listed below.

Unit code	Unit title	Prerequisites
MEA116	Apply work health and safety procedures at supervisor level in aviation maintenance	
MEA121	Manage aircraft/aeronautical product configuration	
MEA133	Communicate aviation technical and maintenance knowledge	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA142	Manage self in the aviation maintenance environment	
MEA706	Apply basic scientific principles and techniques in avionic engineering situations	MEM23004A
MEA708	Select and test avionic engineering materials	
MEM23004A	Apply technical mathematics	
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing, engineering or related environment	
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Elective units of competency

Group A

- Plus **one (1)** of the following elective common units selected in accordance with the guidance provided in column 4. If MEA147 is required **two (2)** units must be taken.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA136	Assess aviation maintenance spares and manage repairable items	MEA135A	Elective – for spares assessors and repairable item managers
MEA137	Write aviation technical publications	MEA135A	Elective – for aviation technical authors
MEA140	Supervise aviation maintenance teams and perform maintenance quality inspections		Elective – for supervisors within the ADF regulatory system
MEA147	Perform airworthiness management and maintenance program tasks	MEA137A	Elective - applicable to CAMO employment

Qualification Mapping Information

Supersedes and is equivalent to MEA50311 Diploma of Aviation Maintenance Management (Avionics)

MEA50415 Diploma of Aviation Maintenance Management (Mechanical)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed in aviation maintenance management fields in both the Civil Aviation Safety Authority (CASA) and Australian Defence Force (ADF) regulatory environments in jobs such as mechanical maintenance team leaders, maintenance planners, spares assessors, repairable item managers and technical authors. It must be emphasised that many of the maintenance management positions applicable to the qualification have additional experience requirements specified in airworthiness regulations and only a limited range of employment opportunities may be available to those who do not have extensive prior aviation maintenance experience. For this reason the qualification has entry requirements.

The qualification consists of:

- eleven (11) core units that provide competencies applicable to aviation maintenance managers
- one (1) or two (2) elective units chosen according to employment need.

Credit is provided towards the MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical).

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Individuals seeking this qualification must meet at least one of the following entry criteria:

- at least five years current aviation mechanical maintenance experience
- Maintenance Engineer Licence (Mechanical) issued by CASA
- Certificate IV in Aeroskills (Mechanical).

Packaging Rules

To be awarded the MEA50411 Diploma of Aviation Maintenance Management (Mechanical), competency must be demonstrated in a total of **twelve (12)** or **thirteen (13)** units of competency.

All units must be chosen as specified under the conditions set out below:

- **eleven (11)** core Diploma level common, engineering and imported units
- **one (1) or (2)** elective Diploma level common units from Group A.

Core units of competency

- Complete the following **five (5)** common Diploma units, **five (5)** paraprofessional engineering units and **one (1)** imported sustainability unit listed below.

Unit code	Unit title	Prerequisites
MEA116	Apply work health and safety procedures at supervisor level in aviation maintenance	
MEA121	Manage aircraft/aeronautical product configuration	
MEA133	Communicate aviation technical and maintenance knowledge	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA142	Manage self in the aviation maintenance environment	
MEA705	Apply basic scientific principles and techniques in aeronautical engineering situations	MEM23004A
MEA707	Select and test aeronautical engineering materials	
MEM23004A	Apply technical mathematics	
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing engineering or related environment	
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Elective units of competency

Group A

- Plus **one (1)** of the following elective common units selected in accordance with the guidance in column four. If MEA147 is required **two (2)** units must be taken.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA136	Assess aviation maintenance spares and manage repairable items	MEA135	Elective – for spares assessors and repairable item managers
MEA137	Write aviation technical publications	MEA135	Elective – for aviation technical authors
MEA140	Supervise aviation maintenance teams and perform maintenance quality inspections		Elective – for supervisors within the ADF regulatory system
MEA147	Perform airworthiness management and maintenance program tasks	MEA137	Applicable to CAMO employment

Qualification Mapping Information

Supersedes and is equivalent to MEA50411 Diploma of Aviation Maintenance Management (Mechanical)

Links

Companion Volume implementation guides are found in VETNet -

MEA50515 Diploma of Aeroskills (Non-Destructive Testing)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals who perform non-destructive testing (NDT) on aircraft and aircraft components in accordance with *AS 3669-2006 Non-destructive testing – Qualification and approval of personnel – Aerospace* at Level 2 and in compliance with the regulatory requirements of the Civil Aviation Safety Authority (CASA) and of the Australian Defence Force (ADF).

The requirement for the awarding of MEA50515 Diploma of Aeroskills (Non-Destructive Testing) is demonstrated competency in listed units of competency under the conditions set out below. It consists of core units plus applicable units from electives Group A.

Core units are as follows:

- preliminary common and technical stream units for individuals who do not have a Certificate IV in Aeroskills
- mandatory units consisting of:
 - common and technical stream units that relate to the aviation maintenance environment
 - technical stream and imported units relating to the NDT work environment

imported units that specifically cover the competencies required to perform each relevant NDT technique to the standard specified in *AS 3669-2006 Non-destructive testing – Qualification and approval of personnel – Aerospace* for Level 2 personnel.

Elective Group A units consist of:

- common units specific to either CASA or ADF regulatory requirements
- technical stream and imported units that are applicable to various areas of employment in the NDT field.

The core and elective units provide for two training pathways to the qualification as follows:

- one that provides for Certificate IV qualified aviation tradespersons to progress to the Diploma level NDT qualification (the career path for uniformed ADF personnel and possibly some civilian personnel)

- another that provides for progression to Diploma level NDT qualification from direct entry (the career path that may be followed by NDT personnel used by the maintenance organisations other than those operating under the ADF regulatory system).

The qualification also provides credits towards the MEA50415 Diploma of Aviation Maintenance Management (Mechanical), the MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical) and the MEA60315 Advanced Diploma of Aviation Non-Destructive Testing.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA50515 Diploma of Aeroskills (Non-Destructive Testing) competency must be demonstrated in **twenty-five (25)** to **thirty-four (34)** units, chosen as described below.

Core units of competency

- Individuals who do not have a Certificate IV in Aeroskills must complete the following **nine (9)** core preliminary units.

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA340	Lay out and set up aircraft systems	MEA101B,

		MEA107B MEA109B
MEA341	Apply basic aircraft design characteristics	MEA101B, MEA107B MEA109B
MEA342	Apply basic aircraft power plant design characteristics	MEA101B, MEA107B MEA109B

Individuals who have a Certificate IV in Aeroskills and those who have completed the preliminary units must complete the following **twenty-two (22)** core units.

Unit code	Unit title	Prerequisites
MEA116	Apply work health and safety procedures at supervisor level in aviation maintenance	
MEA133	Communicate aviation technical and maintenance management knowledge	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA142	Manage self in the aviation maintenance environment	
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA261	Use electronic test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA424	Evaluate aircraft structure non-destructive tests	MEA109, MEA133 MEM13013B MEM16010A MEM24002B MEM24004B MEM24006B MEM24008B MEM24010B MEM24012C

MEM09002B	Interpret technical drawing	
MEM09003B	Prepare basic engineering drawing	MEM09002B
MEM12003B	Perform precision mechanical measurement	MEM12023A (see Note 1)
MEM13013B	Work safely with ionising radiation	
MEM15017B	Use and maintain reference standards	MEM11011B MEM12003B MEM12004B (see Note 2) MEM12005B MEM12023A (see Note 1) MEM18001C (see Note 1) MEM18002B (see Note 1)
MEM16010A	Write reports	MEM14005A (see Note 3)
MEM24002B	Perform penetrant testing	MEM18001C (see Note 1) MEM24012C
MEM24004B	Perform magnetic particle testing	MEM18001C (see Note 1) MEM24012C
MEM24006B	Perform eddy current testing	MEM18001C (see Note 1)
MEM24008B	Perform ultrasonic testing	MEM18001C (see Note 1) MEM24012C
MEM24010B	Perform radiographic testing	MEM13013B

		MEM18001C (see Note 1) MEM24012C
MEM24012C	Apply metallurgy principles	
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing, engineering or related environment	
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Notes

1. MEA109 is equivalent to the following three units combined MEM12023A, MEM18001C and MEM18002B
2. MEA260 and MEA261 are together equivalent to MEM12004B
3. MEA103 is equivalent to MEM14005A

Elective units of competency

Group A

- Complete **three (3)** units chosen in accordance with the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA112	Plan and implement civil aircraft maintenance activities	All relevant technical units	Mandatory for CASA regulatory system
MEA113	Supervise civil aircraft maintenance activities and manage human resources in the workplace	All relevant technical units	Mandatory for CASA regulatory system
MEA140	Supervise aviation maintenance teams and perform maintenance		Mandatory for ADF regulatory system

	quality inspections		
MEM15010B	Perform laboratory procedures		
MEM17002B	Conduct workplace assessment		
TAEDEL301A	Provide work skill instruction		

Qualification Mapping Information

Supersedes and is equivalent to MEA50511 Diploma of Aeroskills (Non-Destructive Testing)

MEA50615 Diploma of Aeronautical Engineering

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed in engineering departments of manufacturers and aviation maintenance organisations in both the Civil Aviation Safety Authority (CASA) and Australian Defence Force (ADF) regulatory environments. Individuals could also be employed in Continuing Airworthiness Management Organisations (CAMOs) and in ADF Approved Engineering Organisations (AEOs). Typical jobs could be supporting professional engineers in design teams, members of airworthiness review teams, maintenance planners, spares assessors, repairable item managers and technical authors. While a direct entry training pathway is provided it must be emphasised that many of the maintenance management positions applicable to the qualification have additional experience requirements specified in airworthiness regulations and only a limited range of employment opportunities may be available to those who do not have extensive prior aviation maintenance experience.

The qualification consists of twenty-six (26) units, of which seventeen (17) are core units and the remaining nine (9) are electives of which either three (3) or six (6) units must be chosen in accordance with unit selection guidance provided in the Group A table.

Credit is provided towards the MEA60415 Advanced Diploma of Aeronautical Engineering.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA50615 Diploma of Aeronautical Engineering, competency must be demonstrated in a total of **twenty (20)** or **twenty-three (23)** units of competency, consisting of:

- **seventeen (17)** core units
- **three (3)** electives chosen from Group A, for which unit selection guidelines have been provided. If Certificate IV in Aeroskills (Mechanical) is not held a further **three (3)** units must be taken from Group A, as specified in the unit selection guidelines.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA133	Communicate aviation technical and maintenance knowledge	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA142	Manage self in the aviation maintenance environment	
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA327	Fabricate and/or repair aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA705	Apply basic scientific principles and techniques in aeronautical engineering situations	MEM23004A
MEA707	Select and test aeronautical engineering materials	
MEM23004A	Apply technical mathematics	

Unit code	Unit title	Prerequisites
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing engineering or related environment	
MSAENV472	Implement and monitor environmentally sustainable work practices	

Elective units of competency

Group A

- Take **three (3)** of the following elective units selected in accordance with the guidance in column 4. A further **three (3)** units is required if Certificate IV in Aeroskills (Mechanical) is not held.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA121	Manage aircraft/aeronautical product configuration		For employment within CAMOs and AEOs
MEA137	Write aviation maintenance technical publications	MEA135	For employment within CAMOs and AEOs
MEA147	Perform airworthiness management and maintenance program tasks	MEA137	For employment within CAMOs and AEOs
MEA340	Lay out and set up aircraft systems	MEA101, MEA107 MEA109	Must be taken if Certificate IV in Aeroskills (Mechanical) is not held
MEA341	Apply basic aircraft design characteristics	MEA101, MEA107 MEA109	Must be taken if Certificate IV in Aeroskills (Mechanical) is not held

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA342	Apply basic aircraft power plant design characteristics	MEA101, MEA107 MEA109	Must be taken if Certificate IV in Aeroskills (Mechanical) is not held
MEA701	Produce aeronautical engineering related graphics	MEA137 MEM30007A MEM30012A	For employment within engineering departments
MEA713	Integrate aeronautical fundamentals into an engineering task	MEA705 MEM23004A MEM23007A	For employment within engineering departments
MEM23007A	Apply calculus to engineering tasks	MEM23004A	For employment within engineering departments

MEA50715 Diploma of Avionic Engineering

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed in engineering departments of manufacturers and aviation maintenance organisations in both the Civil Aviation Safety Authority (CASA) and Australian Defence Force (ADF) regulatory environments. Individuals could also be employed in Continuing Airworthiness Management Organisations (CAMOs) and in ADF Approved Engineering Organisations (AEOs). Typical jobs could be supporting professional engineers in design teams, members of airworthiness review teams, maintenance planners, spares assessors, repairable item managers and technical authors. While a direct entry training pathway is provided it must be emphasised that many of the maintenance management positions applicable to the qualification have additional experience requirements specified in airworthiness regulations and only a limited range of employment opportunities may be available to those who do not have extensive prior aviation maintenance experience.

The qualification consists of twenty-nine (29) units, of which twenty (20) are core units and the remaining nine (9) units are electives from which either three (3) or five (5) units must be selected using the unit selection guidance in the Group A table.

Credit is provided towards the MEA60515 Advanced Diploma of Avionic Engineering.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA50715 Diploma of Avionic Engineering, competency must be demonstrated in a total of **twenty-three (23)** or **twenty-five (25)** units of competency, consisting of:

- **twenty (20)** core units
- **three (3)** elective units chosen from Group A plus a further **two (2)** units if Certificate IV in Aeroskills (Avionics) is not held.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA133	Communicate aviation technical and maintenance knowledge	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA142	Manage self in the aviation maintenance environment	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA261	Use electronic test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

Unit code	Unit title	Prerequisites
MEA262	Modify/repair single layer printed circuit boards	MEA260, MEA261
MEA706	Apply basic scientific principles and techniques in avionic engineering situations	MEM23004A
MEA708	Select and test avionic engineering materials	
MEM23004A	Apply technical mathematics	
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing engineering or related environment	
MSAENV472B	Implement and monitor environmentally sustainable work practices	

Elective units of competency

Group A

- Take **three (3)** of the following elective units selected in accordance with the guidance in column 4. If certificate IV in Aeroskills (Avionics) is not held take an additional **two (2)** units in accordance with the unit selection guidelines.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA121A	Manage aircraft/aeronautical product configuration		For employment within CAMOs and AEOs
MEA137A	Write aviation maintenance technical publications	MEA135	For employment within CAMOs and AEOs
MEA147A	Perform airworthiness management and maintenance program tasks	MEA137	For employment within CAMOs and AEOs
MEA270	Lay out avionic systems	MEA101, MEA107 MEA109	Must be taken if Certificate IV in Aeroskills

Unit code	Unit title	Prerequisites	Unit selection guidance
			(Avionics) is not held
MEA271	Lay out avionic flight management systems	MEA101, MEA107 MEA109, MEA270	Must be taken if Certificate IV in Aeroskills (Avionics) is not held
MEA702A	Produce avionics engineering related graphics	MEA137, MEM30007A MEM30012A	For employment within engineering departments
MEA714A	Integrate avionic fundamentals into an engineering task	MEA706 MEM23004A MEM23007A OR MEA727	For employment within engineering departments
MEA727	Apply calculus to engineering situations	MEM23004A	
MEM23007A	Apply calculus to engineering tasks	MEM23004A	For employment within engineering departments

MEA60115 Advanced Diploma of Aviation Maintenance Management (Avionics)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed in managerial positions in both the Civil Aviation Safety Authority (CASA) and Australian Defence Force (ADF) regulatory environments in the fields of avionic maintenance management and integrated logistic support (ILS). It should also be noted that most of the maintenance management positions applicable to this qualification have airworthiness regulatory requirements regarding aviation maintenance experience. There is therefore no direct entry pathway to the qualification.

The qualification consists of:

- twenty-five (25) common units and two (2) imported units, seventeen (17) of which are elective, that provide general competencies applicable to aviation maintenance managers
- five (5) paraprofessional avionic engineering units.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Individuals seeking this qualification must meet at least one of the following entry criteria:

- at least five years current avionic maintenance experience
- Maintenance Engineer Licence (Avionics) issued by CASA
- Certificate IV in Aeroskills (Avionics)
- Diploma of Aviation Maintenance Management (Avionics).

Packaging Rules

To be awarded the MEA60115 Advanced Diploma of Aviation Maintenance Management (Avionics), competency must be demonstrated in a total of **twenty (20)** units of competency, as described below.

If a Diploma of Aviation Maintenance Management (Avionics) has been attained, **ten (10)** of the required units will be already held and the number of additional units required is **ten (10)**.

In all other cases the number of units required is **twenty (20)**.

All units must be chosen as specified under the conditions set out below:

- **sixteen (16)** core units consisting of engineering, common and imported units
- **four (4)** elective units chosen from the common and imported units in Group A.

Core units of competency

- The **five (5)** paraprofessional engineering units listed below are mandatory for those who do not have a Diploma of Aviation Maintenance Management (Avionics).

Unit code	Unit title	Prerequisites
MEA706	Apply basic scientific principles and techniques in avionic engineering situations	MEM23004A
MEA708	Select and test avionic engineering materials	
MEM23004A	Apply technical mathematics	
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing engineering or related environment	

- Complete the **eleven (11)** Advanced Diploma/Diploma common and imported units listed below (those with a Diploma of Aviation Maintenance Management (Avionics) will already have MEA121, MEA133, MEA135 and MEA142).

Unit code	Unit title	Prerequisites
MEA120	Manage an aviation maintenance quality system	
MEA121	Manage aircraft/aeronautical product configuration	
MEA123	Manage aviation maintenance work environment policy and practices	
MEA124	Coordinate change programs in the aviation maintenance environment	
MEA125	Develop aviation maintenance personnel	

Unit code	Unit title	Prerequisites
MEA133	Communicate aviation technical and maintenance knowledge	
MEA134	Establish, maintain and evaluate the organisation's work health and safety system	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA141	Manage risk in aviation maintenance	
MEA142	Manage self in the aviation maintenance environment	
MSAENV672B	Develop workplace policy and procedures for environmental sustainability	

Elective units of competency

Group A

- Plus **four (4)** of the elective Advanced Diploma/Diploma common and imported units listed below (those with a Diploma of Aviation Maintenance Management (Avionics) will already have one (1) of MEA136, MEA137 and MEA140). Units should be selected using the guidance in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA115	Plan and implement aeronautical product maintenance activities		
MEA122	Manage aircraft/equipment system performance testing	MEA126	
MEA126	Manage aircraft maintenance activities		
MEA127	Provide technical advice in the maintenance and management of aircraft and aeronautical product	MEA706, MEA708	Applicable to the CASA regulatory environment

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA128	Provide engineering advice in the modification, maintenance and management of aircraft systems	MEA706, MEA708	Applicable to the ADF regulatory environment
MEA129	Investigate technical aspects of aviation occurrences		Applicable to the ADF regulatory environment
MEA130	Manage deployed/detached aviation maintenance activities		Applicable to the ADF regulatory environment
MEA131	Manage the custody, transfer and disposal of aircraft, aeronautical product and support equipment		
MEA132	Manage budgetary resources in the aviation maintenance environment		Either MEA146 or PSPMNGT610A may be taken instead of this unit
MEA136	Assess aviation maintenance spares and manage repairable items	MEA135	
MEA137	Write aviation technical publications	MEA135	
MEA138	Perform aviation technical publication management activities	MEA137	
MEA139	Perform aviation maintenance-related integrated logistic support activities		
MEA140	Supervise aviation maintenance teams and perform maintenance quality inspections		For supervisors within the ADF regulatory system
MEA143	Develop and manage maintenance error management		Applicable to the CASA regulatory

Unit code	Unit title	Prerequisites	Unit selection guidance
	programs		environment
MEA146	Prepare and manage aviation maintenance organisation budgets and financial plans		Alternative to MEA132 and to PSPMNGT610A
MEA147	Perform airworthiness management and maintenance program tasks	MEA137	Applicable to CAMO employment
PSPMNGT610A	Manage public sector financial resources		Alternative to MEA132 and to MEA146

Qualification Mapping Information

Supersedes and is equivalent to MEA60111 Advanced Diploma of Aviation Maintenance Management (Avionics)

MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical)

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed in managerial positions in both the Civil Aviation Safety Authority (CASA) and Australian Defence Force (ADF) regulatory environments in the fields of mechanical maintenance management and integrated logistic support (ILS). It should also be noted that most of the maintenance management positions applicable to this qualification also have airworthiness regulatory requirements regarding aviation maintenance experience. There is therefore no direct entry pathway to the qualification.

The qualification consists of:

- twenty-five (25) common units and two (2) imported units, seventeen (17) of which are elective, that provide general competencies applicable to aviation maintenance managers
- five (5) paraprofessional aeronautical engineering units.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Individuals seeking this qualification must meet at least one of the following entry criteria:

- at least five years current aviation mechanical maintenance experience
- Maintenance Engineer Licence (Mechanical) issued by CASA
- Certificate IV in Aeroskills (Mechanical)
- Diploma of Aviation Maintenance Management (Mechanical).

Packaging Rules

To be awarded the MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical), competency must be demonstrated in a total of **twenty (20)** units of competency, as described below.

If the Diploma of Aviation Maintenance Management (Mechanical) has been achieved, the number of units required is **ten (10)**.

In all other cases, the number of units required is **twenty (20)**.

All units must be chosen as specified under the conditions set out below:

- **sixteen (16)** core units consisting of engineering, common and imported units
- **four (4)** elective units chosen from the common and imported units in Group A.

Core units of competency

- The **five (5)** paraprofessional engineering units listed below are mandatory for those who do not have a Diploma of Aviation Maintenance Management (Mechanical).

Unit code	Unit title	Prerequisites
MEA705	Apply basic scientific principles and techniques in aeronautical engineering situations	MEM23004A
MEA707	Select and test aeronautical engineering materials	
MEM23004A	Apply technical mathematics	
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing engineering or related environment	

- Complete the **eleven (11)** Advanced Diploma/Diploma common units listed below (those with Diploma of Aviation Maintenance Management (Mechanical) will already have MEA121, MEA133, MEA135 and MEA142).

Unit code	Unit title	Prerequisites
MEA120	Manage an aviation maintenance quality system	
MEA121	Manage aircraft/aeronautical product configuration	
MEA123	Manage aviation maintenance work environment policy and practices	
MEA124	Coordinate change programs in the aviation	

Unit code	Unit title	Prerequisites
	maintenance environment	
MEA125	Develop aviation maintenance personnel	
MEA133	Communicate aviation technical and maintenance knowledge	
MEA134	Establish, maintain and evaluate the organisation's work health and safety system	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA141	Manage risk in aviation maintenance	
MEA142	Manage self in the aviation maintenance environment	
MSAENV672B	Develop workplace policy and procedures for environmental sustainability	

Elective units of competency

Group A

- Take **four (4)** of the elective Advanced Diploma/Diploma common units listed below (those with Diploma of Aviation Maintenance Management (Mechanical) will already have **one (1)** of MEA136, MEA137 and MEA140). Units should be selected using the guidance in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA115	Plan and implement aeronautical product maintenance activities		
MEA122	Manage aircraft/equipment system performance testing	MEA126	
MEA126	Manage aircraft maintenance activities		
MEA127	Provide technical advice in the maintenance and management of	MEA705, MEA707	Applicable to the CASA regulatory

Unit code	Unit title	Prerequisites	Unit selection guidance
	aircraft and aeronautical product		environment
MEA128	Provide engineering advice in the modification, maintenance and management of aircraft systems	MEA705, MEA707	Applicable to the ADF regulatory environment
MEA129	Investigate technical aspects of aviation occurrences		Applicable to the ADF regulatory environment
MEA130	Manage deployed/detached aviation maintenance activities		Applicable to the ADF regulatory environment
MEA131	Manage the custody, transfer and disposal of aircraft, aeronautical product and support equipment		
MEA132	Manage budgetary resources in the aviation maintenance environment		Either MEA146 or PSPMNGT610A may be taken instead of this unit
MEA136	Assess aviation maintenance spares and manage repairable items	MEA135	
MEA137	Write aviation maintenance technical publications	MEA135	
MEA138	Perform aviation technical publication management activities	MEA137	
MEA139	Perform aviation maintenance-related integrated logistic support management activities		
MEA140	Supervise aviation maintenance teams and perform maintenance quality inspections		For supervisors within the ADF regulatory system
MEA143	Develop and manage maintenance error management		Applicable to the CASA regulatory

Unit code	Unit title	Prerequisites	Unit selection guidance
	programs		environment
MEA146	Prepare and manage aviation maintenance organisation budgets and financial plans		Alternative to MEA132 and to PSPMNGT610A
MEA147	Perform airworthiness management and maintenance program tasks	MEA137	Applicable to CAMO employment
PSPMNGT610 A	Manage public sector financial resources	1	Alternative to MEA132 and MEA146

MEA60315 Advanced Diploma of Aviation Non-Destructive Testing

Modification History

Release 2 - Total number of units required to achieve qualification corrected from 'forty-one (41) to fifty (50)' to '**thirty-nine (39) to forty-eight (48)**'.

Release 1 - New qualification

Qualification Description

This qualification applies to individuals who perform aircraft and aircraft component non-destructive testing (NDT), develop NDT techniques and provide training in NDT in accordance with *AS 3669-2006 Non-destructive testing – Qualification and approval of personnel – Aerospace* at Level 3. The qualification also meets the regulatory requirements of the Civil Aviation Safety Authority (CASA) and of the Australian Defence Force (ADF).

The requirement for the awarding of MEA60315 Advanced Diploma of Aviation Non-Destructive Testing is demonstrated competency in listed units of competency under the conditions set out below. It consists of core units and electives chosen from Electives Group A.

Core units include:

- preliminary common and technical stream units for individuals who do not have a Certificate IV in Aeroskills or the Diploma of Aeroskills (Non-Destructive Testing)
- mandatory units consisting of:
 - common and technical stream units that relate to the aviation maintenance environment
 - technical stream and imported units relating to the NDT work environment
 - imported units that specifically cover the competencies required to perform each relevant NDT technique to the standard specified in *AS 3669-2006 Non-destructive testing – Qualification and approval of personnel – Aerospace* for Level 2 and 3 personnel
 - imported units that cover competencies in the development, delivery and assessment of training.

Elective Group A units consisting of:

- common units specific to either CASA or ADF regulatory requirements
- technical stream and imported units that are applicable to various areas of employment in the NDT field at *AS 3669-2006 Non-destructive testing – Qualification and approval of personnel – Aerospace* Level 3

Individuals who have a Certificate IV in Aeroskills and/or the Diploma of Aeroskills (Non-Destructive Testing) will already have a significant number of credits towards this qualification.

The qualification also provides credits towards the MEA60215 Advanced Diploma of Aviation Maintenance Management (Mechanical).

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA60315 Advanced Diploma of Aviation Non-Destructive Testing, competency must be demonstrated in **thirty-nine (39)** to **forty-eight (48)** units, depending on the entry level.

Core units of competency

- Individuals who do not have at least a Certificate IV in Aeroskills must complete the following **nine (9)** preliminary units.

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105

MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA340	Lay out and set up aircraft systems	MEA101, MEA107 MEA109
MEA341	Apply basic aircraft design characteristics	MEA101, MEA107 MEA109
MEA342	Apply basic aircraft power plant design characteristics	MEA101, MEA107 MEA109

- Individuals who have at least a Certificate IV in Aeroskills and those who have completed the preliminary units must complete the following **thirty-five (35)** core units.

Unit code	Unit title	Prerequisites
MEA116	Apply work health and safety procedures at supervisor level in aviation maintenance	
MEA120	Manage an aviation maintenance quality system	
MEA133	Communicate aviation technical and maintenance management knowledge	
MEA134	Establish, maintain and evaluate the organisation's work health and safety system	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA137	Write aviation technical publications	MEA135
MEA138	Perform aviation technical publication management activities	MEA137
MEA142	Manage self in the aviation maintenance environment	
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA261	Use electronic test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109

MEA705	Apply basic scientific principles and techniques in aeronautical engineering situations	MEM23004A
MEA708	Select and test aeronautical engineering materials	
MEA424	Evaluate aircraft structure non-destructive tests	MEA109, MEA133 MEM13013B MEM16010A MEM24002B MEM24004B MEM24006B MEM24008B MEM24010B MEM24012C
MEM09002B	Interpret technical drawing	
MEM09003B	Prepare basic engineering drawing	MEM09002B
MEM12003B	Perform precision mechanical measurement	MEM12023A (see Note 1)
MEM13013B	Work safely with ionising radiation	
MEM15017B	Use and maintain reference standards	MEM11011B MEM12003B MEM12004B (see Note 2) MEM12005B MEM12023A (see Note 1) MEM18001C (see Note 1) MEM18002B (see Note 1)
MEM16010A	Write reports	MEM14005A (see Note 4)
MEM23004A	Apply technical mathematics	
MEM24002B	Perform penetrant testing	MEM18001C

		(see Note 1) MEM24012C
MEM24004B	Perform magnetic particle testing	MEM18001C (see Note 1) MEM24012C
MEM24006B	Perform eddy current testing	MEM18001C (see Note 1) MEM24012C
MEM24008B	Perform ultrasonic testing	MEM18001C (see Note 1) MEM24012C
MEM24010B	Perform radiographic testing	MEM13013B MEM18001C (see Note 1) MEM24012C
MEM24011B	Establish non-destructive tests	MEM13013B MEM16010A (see Note 3) MEM18001C (see Note 1) MEM24002B MEM24004B MEM24006B MEM24008B MEM24010B MEM24012C
MEM24012C	Apply metallurgy principles	
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing, engineering or related environment	
MSAENV672B	Develop workplace policy and procedures for	

	environmental sustainability	
TAEDEL402A	Plan, organise and facilitate learning in the workplace	
TAEASS401B	Plan assessment activities and processes	
TAEASS402B	Assess competence	
TAEASS403B	Participate in assessment validation	
TAEASS502B	Design and develop assessment tools	

Notes

1. MEA109 is equivalent to the following three units combined MEM12023A, MEM18001C and MEM18002B
2. MEA260 and MEA261 are together equivalent to MEM12004B
3. MEA137 is equivalent to MEM16010A
4. MEA103 is equivalent to MEM14005A

Electives units of competency

Group A

- Complete **four (4)** units chosen in accordance with the unit selection guidelines in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA112	Plan and implement civil aircraft maintenance activities	All relevant technical units	Mandatory for CASA regulatory system
MEA113	Supervise civil aircraft maintenance activities and manage human resources in the workplace	All relevant technical units	Mandatory for CASA regulatory system
MEA123	Manage aviation maintenance work environment policy and practices		

Unit code	Unit title	Prerequisites	Unit selection guidelines
MEA140	Supervise aviation maintenance teams and perform maintenance quality inspections		Mandatory for ADF regulatory system
MEM09009C	Create 2D drawings using computer aided design systems	MEM09002B MEM16008A	
MEM15010B	Perform laboratory procedures		
MEM16002C	Conduct formal interviews and negotiations		
MEM16008A	Interact with computing technology		
TAEDES401A	Design and develop learning programs		

Qualification Mapping Information

Supersedes and is equivalent to MEA60311 Advanced Diploma of Aviation Non-Destructive Testing

MEA60415 Advanced Diploma of Aeronautical Engineering

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed in senior paraprofessional engineering and in managerial positions in both the Civil Aviation Safety Authority (CASA) and Australian Defence Force (ADF) regulatory environments in the fields of aeronautical engineering and engineering management. It should also be noted that many of the positions applicable to this qualification also have airworthiness regulatory requirements regarding prior aviation experience.

There are a total of forty-four (44) units of which twenty-four (24) are core units and the remainder are electives from which units must be chosen in accordance with the selection guidance provided.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA60415 Advanced Diploma of Aeronautical Engineering, competency must be demonstrated in a total of **twenty-eight (28)** or **thirty-one (31)** units of competency, consisting of:

- **twenty-four (24)** core units
- either **four (4)** or **seven (7)** elective units chosen from Group A.

Core units of competency

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in	

Unit code	Unit title	Prerequisites
	aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105 MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA133	Communicate aviation technical and maintenance knowledge	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA137	Write aviation maintenance technical publications	MEA135
MEA142	Manage self in the aviation maintenance environment	
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA327	Fabricate and/or repair aircraft mechanical components or parts	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA701	Produce aeronautical engineering related graphics	MEA137 MEM30007A MEM30012A
MEA703	Apply aeronautical modelling for computer aided engineering	MEA701
MEA705	Apply basic scientific principles and techniques in aeronautical engineering situations	MEM23004A

Unit code	Unit title	Prerequisites
MEA707	Select and test aeronautical engineering materials	
MEA709	Apply aeronautical structure design techniques	MEA701, MEA703 MEA705, MEA707 MEM23004A MEM23007A
MEA710	Apply aeronautical system design techniques	MEA701, MEA703 MEA705 MEM23004A
MEA713	Integrate aeronautical fundamentals into an engineering task	MEA705 MEM23004A MEM23007A
MEM23004A	Apply technical mathematics	
MEM23007A	Apply calculus to engineering tasks	MEM23004A
MEM30007A	Select common engineering materials	
MEM30012A	Apply mathematical techniques in a manufacturing engineering or related environment	
MSAENV672B	Develop workplace policy and procedures for environmental sustainability	

Elective units of competency

Group A

- Take either **four (4)** or, where either the Diploma of Aeronautical Engineering or the Certificate IV in Aeroskills (Mechanical) is not held, **seven (7)** of the elective units listed below. Units should be selected, where applicable, using the guidance in column 4.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA127	Provide technical advice in the maintenance and management of aircraft and aeronautical product	MEA705 MEA707	Applicable to the CASA regulatory environment

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA128	Provide engineering advice in the modification, maintenance and management of aircraft systems	MEA705, MEA707	Applicable to the ADF regulatory environment
MEA129	Investigate technical aspects of aviation occurrences		Applicable to the ADF regulatory environment
MEA143	Develop and manage maintenance error management programs		Applicable to the CASA regulatory environment
MEA147	Perform airworthiness management and maintenance program tasks	MEA137	Applicable to the CASA regulatory environment
MEA340	Lay out and set up aircraft systems	MEA101, MEA107 MEA109	Must be taken if Certificate IV in Aeroskills (Mechanical) or Diploma of Aeronautical Engineering is not held
MEA341	Apply basic aircraft design characteristics	MEA101, MEA107 MEA109	Must be taken if Certificate IV in Aeroskills (Mechanical) or Diploma of Aeronautical Engineering is not held
MEA342	Apply basic aircraft power plant design characteristics	MEA101, MEA107 MEA109	Must be taken if Certificate IV in Aeroskills (Mechanical) or Diploma of Aeronautical Engineering is not held
MEA715	Evaluate aeroplane flight	MEA710	Choose in

Unit code	Unit title	Prerequisites	Unit selection guidance
	control systems	MEM23004A MEM23007A	accordance with employment field

MEA60515 Advanced Diploma of Avionic Engineering

Modification History

Release 1 - New qualification

Qualification Description

This qualification applies to individuals employed in senior paraprofessional engineering and in managerial positions in both the Civil Aviation Safety Authority (CASA) and the Australian Defence Force (ADF) regulatory environments in the fields of avionic engineering and engineering management. It should also be noted that many of the positions applicable to this qualification also have airworthiness regulatory requirements regarding prior aviation experience.

There are a total of forty-three (44) units of which twenty-eight (28) are core units and the remainder are electives from which units must be chosen in accordance with the selection guidance provided.

This qualification applies to workplaces that operate under the airworthiness regulatory systems of the ADF and CASA. Any regulatory/licensing requirements associated with any MEA units of competency must be met.

Entry Requirements

Not applicable

Packaging Rules

To be awarded the MEA60515 Advanced Diploma of Avionic Engineering, competency must be demonstrated in a total of **thirty-two (32)** or **thirty-four (34)** units of competency, consisting of:

- **twenty-eight (28)** core units
- **four (4)** or **six (6)** elective units from Group A chosen in accordance with the unit selection guidelines.

Core units of competency

Unit code	Unit title	Prerequisites
-----------	------------	---------------

Unit code	Unit title	Prerequisites
MEA101	Interpret work health and safety practices in aviation maintenance	
MEA103	Plan and organise aviation maintenance work activities	MEA101, MEA105, MEA107, MEA108
MEA105	Apply quality standards applicable to aviation maintenance processes	MEA101, MEA107
MEA107	Interpret and use aviation maintenance industry manuals and specifications	
MEA108	Complete aviation maintenance industry documentation	MEA105
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance	MEA105, MEA108
MEA133	Communicate aviation technical and maintenance knowledge	
MEA135	Use computers in aviation maintenance-related integrated logistic support activities	
MEA137	Write aviation maintenance technical publications	MEA135
MEA142	Manage self in the aviation maintenance environment	
MEA201	Remove and install miscellaneous aircraft electrical hardware/components	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA246	Fabricate and/or repair aircraft electrical hardware or parts	MEA201, MEA260
MEA260	Use electrical test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA261	Use electronic test equipment	MEA101, MEA103 MEA105, MEA107 MEA108, MEA109
MEA262	Modify/repair single layer printed circuit boards	MEA260, MEA261

Unit code	Unit title	Prerequisites
MEA702	Produce aeronautical engineering related graphics	MEA137 MEM30007A MEM300012A
MEA704	Apply avionic modelling for computer-aided engineering	MEA702
MEA706	Apply basic scientific principles and techniques in avionic engineering situations	MEM23004A
MEA708	Select and test avionic engineering materials	
MEA711	Apply avionic analogue design techniques	MEA702, MEA708 MEA714, MEA725
MEA712	Apply avionic digital design techniques	MEA702, MEA708 MEA714, MEA725
MEA714	Integrate avionic fundamentals into an engineering task	MEA706, and MEM23004A, Plus MEM23007A OR MEA726
MEA725	Apply advanced scientific principles and techniques in avionic engineering situations	MEA706, MEA727
MEA727	Apply calculus in avionic engineering situations	MEM23004A
MEM30007A	Select common engineering materials	
MEM23004A	Apply technical mathematics	
MEM30012A	Apply mathematical techniques in a manufacturing engineering or related environment	
MSAENV672B	Develop workplace policy and procedures for environmental sustainability	

Elective units of competency

Group A

- Take **four (4)** of the elective Advanced Diploma/Diploma common and paraprofessional engineering units listed below. Where applicable, units should be selected using the guidance in column 4. In addition, take the **two (2)** additional units as indicated if either the Diploma of Avionic Engineering or the Certificate IV in Aeroskills (Avionics) is not held.

Unit code	Unit title	Prerequisites	Unit selection guidance
MEA127	Provide technical advice in the maintenance and management of aircraft and aeronautical product	MEA706, MEA708	Applicable to the CASA regulatory environment
MEA128	Provide engineering advice in the modification, maintenance and management of aircraft systems	MEA706, MEA708	Applicable to the ADF regulatory environment
MEA129	Investigate technical aspects of aviation occurrences		Applicable to the ADF regulatory environment
MEA138	Perform aviation technical publication management activities	MEA137	
MEA143	Develop and manage maintenance error management programs		Applicable to the CASA regulatory environment
MEA147	Perform airworthiness management and maintenance program tasks	MEA137	Applicable to the CASA regulatory environment
MEA270	Lay out avionic systems	MEA101, MEA107 MEA109	Must be taken if Certificate IV in Aeroskills (Avionics) or the Diploma of Avionic Engineering is not held
MEA271	Lay out avionic flight management systems	MEA101, MEA107 MEA109, MEA270	Must be taken if Certificate IV in Aeroskills

Unit code	Unit title	Prerequisites	Unit selection guidance
			(Avionics) or the Diploma of Avionic Engineering is not held
MEA716	Evaluate avionic analogue systems	MEA711, MEA727	
MEA717	Evaluate avionic digital systems	MEA712, MEA727	
MEA719	Evaluate aircraft electrical systems	MEA726	
MEA726	Apply aircraft electrical system design techniques	MEA702, MEA706 MEA708, MEA714 MEA725	
MEA729	Apply configuration management procedures in airworthiness engineering management	MEA135, MEA138	
MEA730	Apply systems engineering procedures to airworthiness engineering design project management	MEA135, MEA137	
MEM22013A	Coordinate engineering projects

AURVTP2003 Prepare spray painting materials and equipment

Modification History

Release	Comment
Release 1	Replaces AURV229749A Prepare spray painting materials and equipment Unit code updated to meet policy requirements Reference to OHS legislation replaced with new WHS legislation Licensing statement added to unit descriptor

Unit Descriptor

Unit descriptor	This unit of competency covers the skills and knowledge required to prepare spray painting materials and equipment for use. Licensing, legislative, regulatory or certification requirements may apply to this unit in some jurisdictions. Users are advised to check with the relevant regulatory authority.
------------------------	--

Application of the Unit

Application of the unit	The unit includes identification and confirmation of work requirements, preparation for work, preparation of paint for spray guns, preparation of guns and associated equipment, and completion of work finalisation processes, including clean-up and documentation. Work requires individuals to demonstrate judgement and problem-solving skills in managing own work activities and contributing to a productive team environment.
--------------------------------	---

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

Employability skills	This unit contains employability skills.
-----------------------------	--

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for work	<p>1.1. Work instructions are used to determine job requirements, including method and material type.</p> <p>1.2. Job specifications are read and interpreted.</p> <p>1.3. Workplace health and safety (WHS) requirements, including personal protection needs, are observed throughout the work.</p> <p>1.4. Materials are selected and inspected for quality.</p> <p>1.5. Hand, power tooling and safety equipment are identified and checked for operation.</p> <p>1.6. Procedures are determined to minimise waste material.</p> <p>1.7. Procedures are identified for maximising energy efficiency while completing the job.</p>
2. Prepare paint for spray gun(s)	<p>2.1. Information is accessed and interpreted from manufacturer/ component supplier specifications.</p> <p>2.2. Paints are mixed to conform to specification for type and colour, viscosity and temperature.</p> <p>2.3. A test card is used for comparison of colour and</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>texture.</p> <p>2.4.Preparation activities are carried out according to industry regulations/guidelines, WHS requirements, legislation and enterprise procedures/policies.</p> <p>2.5.Paint is prepared without causing damage to component or system.</p> <p>2.6.Waste materials are stored and/or disposed of in accordance with statutory and enterprise requirements.</p>
3. Prepare spray gun(s) for spraying	<p>3.1.Information is accessed and interpreted from manufacturer/ component supplier specifications.</p> <p>3.2.Preparation, maintenance and adjustment of spray painting equipment conforms to requirements of manufacturer/component supplier specifications.</p> <p>3.3.Preparation activities are carried out according to industry regulations/guidelines, WHS requirements, legislation and enterprise procedures/policies.</p> <p>3.4.Spray guns are prepared without causing damage to component or system.</p>
4. Clean up work area and maintain equipment	<p>4.1.Material that can be reused is collected and stored.</p> <p>4.2.Waste and scrap is removed following workplace procedures.</p> <p>4.3.Equipment and work area are cleaned and inspected for serviceable condition in accordance with workplace procedures.</p> <p>4.4.Unserviceable equipment is tagged and faults identified in accordance with workplace procedures.</p> <p>4.5.Operator maintenance is completed in accordance with manufacturer/component supplier specifications and worksite procedures.</p> <p>4.6.Tooling is maintained in accordance with workplace procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

REQUIRED SKILLS AND KNOWLEDGE

Required skills include:

- collect, organise and understand information related to work orders, plans and safety procedures for preparing spray painting material and equipment
- communicate ideas and information to enable confirmation of work requirements and specifications, coordination of work with worksite supervisor, other workers and customers, and the reporting of work outcomes and problems
- plan and organise activities, including preparation and layout of worksite and obtaining of equipment and material to avoid backtracking, workflow interruptions or wastage
- work with others and in a team by recognising dependencies and using cooperative approaches to optimise workflow and productivity
- use mathematical ideas and techniques to calculate time, apply accurate measurements, calculate material requirements and establish quality checks
- establish safe and effective work processes which anticipate and/or resolve problems and downtime, to systematically develop solutions to avoid or minimise reworking and wastage
- use workplace technology related to the preparation of spray painting material and equipment, including the use of specialist tooling, measuring equipment and communication devices and the reporting/documenting of results

Required knowledge

Required knowledge includes:

- WHS cleaning materials, equipment, material and personal safety requirements
- environmental protection requirements
- material storage, handling and disposal/material safety data sheets
- types of paints, including acrylic lacquers, solids, clear over base, air dry and polyurethane, and two component systems
- paint application methods
- spray guns and their application
- manufacturer/component supplier specifications for spray gun set-up and maintenance
- equipment preparation procedures
- paint mixing techniques
- paint drying methods
- work organisation and planning processes
- enterprise quality processes

Evidence Guide

EVIDENCE GUIDE	
<p>The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.</p>	
Overview of assessment	
Critical aspects for assessment and evidence required to demonstrate competency in this unit	<p>It is essential that competence is fully observed and there is ability to transfer competence to changing circumstances and to respond to unusual situations in the critical aspects of:</p> <ul style="list-style-type: none"> • observing safety procedures and requirements • communicating effectively with others involved in or affected by the work • selecting methods and techniques appropriate to the circumstances • completing preparatory activity in a systematic manner • applying environmental procedures • preparing automotive paint to specifications • preparing spray guns and associated equipment to manufacturer/component supplier requirements.
Context of, and specific resources for assessment	<ul style="list-style-type: none"> • Application of competence is to be assessed in the workplace or simulated worksite. • Assessment is to occur using standard and authorised work practices, safety requirements and environmental constraints. • Assessment is to comply with regulatory requirements, including Australian Standards. • The following resources should be made available: <ul style="list-style-type: none"> • workplace location or simulated workplace • material relevant to the preparation of spray painting material and equipment • equipment, hand and power tooling appropriate to the preparation of spray painting material and equipment • activities covering mandatory task requirements • specifications and work instructions.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the Automotive Industry Retail, Service and Repair Training Package. • Assessment methods must confirm consistency and accuracy of performance together with application of underpinning knowledge.

EVIDENCE GUIDE

	<ul style="list-style-type: none"> • Assessment must be by direct observation of tasks, with questioning on underpinning knowledge and it must also reinforce the integration of key competencies. • Assessment may be applied under project-related conditions and require evidence of process. • Assessment must confirm a reasonable inference that competence is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • It is preferable that assessment reflects a process rather than an event and occurs over a period of time to cover varying quality circumstances. Evidence of performance may be provided by customers, team leaders/members or other persons subject to agreed authentication arrangements. • Competence in this unit may be assessed in conjunction with other functional units which together form part of the holistic work role.
--	--

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Methods

Methods are to include:

- spray gun techniques
- various spraying techniques
- drying procedures
- paint mixing methods
- paint straining methods
- paint thinning methods

WHS

WHS requirements are to be in accordance with legislation/regulations/codes of practice and enterprise safety policies and procedures. This may include:

RANGE STATEMENT	
	<ul style="list-style-type: none"> • protective clothing and equipment • use of tooling and equipment • workplace environment and safety • handling of material • use of firefighting equipment • enterprise first aid • hazard control and hazardous material and substances
Personal protective equipment	Personal protective equipment is to include that prescribed under legislation/regulation/codes of practice and workplace policies and practices
Safe operating procedures	<p>Safe operating procedures are to include, but are not limited to:</p> <ul style="list-style-type: none"> • operational risk assessment and treatments associated with vehicular movement, toxic substances, electrical safety, machinery movement and operation, manual and mechanical lifting and shifting, working in proximity to others and worksite visitors
Emergency procedures	<p>Emergency procedures related to this unit are to include, but are not limited to:</p> <ul style="list-style-type: none"> • emergency shutdown and stopping of equipment • extinguishing fires • enterprise first aid requirements • worksite evacuation
Environmental requirements	<p>Environmental requirements are to include, but are not limited to:</p> <ul style="list-style-type: none"> • waste management, noise, dust and clean-up management
Quality requirements	<p>Quality requirements are to include, but are not limited to:</p> <ul style="list-style-type: none"> • regulations, including Australian standards • internal company quality policies and standards • enterprise operations and procedures
Statutory/regulatory authorities	<p>Statutory/regulatory authorities may include:</p> <ul style="list-style-type: none"> • federal, state/territory and local authorities

RANGE STATEMENT	
	administering Acts, regulations and codes of practice
Tooling and equipment	<p>Tooling and equipment may include:</p> <ul style="list-style-type: none"> • tinting machines • microfiche, scales • air-operated agitators • hand paddles • mixing banks • spray gun stem strainers • funnel strainers • mesh strainers • nylon stocking weave • vacuum paint strainers • viscosity measuring equipment • high-volume low-pressure spray guns • gravity feed spray guns • suction feed spray guns • pressure regulators • air compressors • spray booths • baking ovens • heating and lighting systems
Materials	<p>Materials may include:</p> <ul style="list-style-type: none"> • acrylic lacquers • air dry synthetic enamels • two-pack urethane acrylic enamels • metallic two-pack enamels • clear acrylic lacquers • metallic acrylic lacquers • pearl finishes • water-based finishes • paint thinners and paint reducers
Communications	<p>Communications are to include, but are not limited to:</p> <ul style="list-style-type: none"> • verbal and visual instructions and fault reporting and may include worksite specific instructions, written instructions, plans or instructions related to job/task, telephones and pagers

RANGE STATEMENT

Information/documents	<p>Sources of information/documents may include:</p> <ul style="list-style-type: none"> • verbal or written and graphical instructions, signage, work schedules/plans/specifications, work bulletins, memos, material safety data sheets (MSDS), diagrams or sketches • safe work procedures related to the preparation of spray painting material and equipment • regulatory/legislative requirements pertaining to automotive painting and finishing • engineer's design specifications and instructions • organisation work specifications and requirements • instructions issued by authorised enterprise or external persons • Australian standards

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for work	<p>1.1. Work instructions are used to determine the job requirements, including job sheets, material type, colour, quality and quantity.</p> <p>1.2. Job specifications are read and interpreted.</p> <p>1.3. WHS requirements, including personal protection needs, breathing apparatus and full body protection, are observed throughout the work.</p> <p>1.4. Materials are selected and inspected for quality.</p> <p>1.5. Hand tooling and safety equipment are identified and checked for operation.</p> <p>1.6. Procedures are determined to minimise waste material.</p> <p>1.7. Procedures are identified for maximising energy efficiency while completing the job.</p>

ELEMENT	PERFORMANCE CRITERIA
2. Identify paint faults, causes and rectification procedures	<p>2.1. Paint faults are identified according to industry and workplace procedures.</p> <p>2.2. Paint fault causes are determined according to industry and workplace procedures.</p> <p>2.3. Rectification procedures are determined according to fault and type of finish material according to industry standard practices and workplace requirements.</p> <p>2.4. Identification and determination activities are carried out according to industry regulations/guidelines, WHS legislation, and enterprise procedures/policies.</p>
3. Apply air dry and polyurethane enamel refinishing materials by spray gun	<p>3.1. The environment for application of refinishing materials conforms to requirements for temperature, extraction of fumes and cleanliness.</p> <p>3.2. Refinishing materials are applied at manufacturer/component supplier recommended intervals using approved methods.</p> <p>3.3. Refinishing materials are dried using approved methods and equipment.</p> <p>3.4. Refinishing materials are applied without causing damage to any component or system.</p> <p>3.5. The finish produced meets specifications for colour, texture, depth and gloss and is contaminant-free.</p> <p>3.6. Surface refinishing is completed within approved timeframes.</p> <p>3.7. Application activities are carried out according to industry regulations/guidelines, WHS legislation, and enterprise procedures/policies.</p>
4. Clean up work area and maintain equipment	<p>4.1. Material that can be reused is collected and stored.</p> <p>4.2. Waste material is removed and disposed of or stored according to statutory and workplace procedure.</p> <p>4.3. Spray equipment is cleaned as specified by manufacturer/component supplier and/or workplace policy and procedures.</p> <p>4.4. Work area is cleaned and inspected for serviceable condition in accordance with workplace procedures.</p> <p>4.5. Unserviceable equipment is tagged and faults identified in accordance with workplace procedures.</p> <p>4.6. Operator maintenance is completed in accordance with manufacturer/component supplier specifications and worksite procedures.</p> <p>4.7. Tooling is maintained in accordance with workplace</p>

ELEMENT	PERFORMANCE CRITERIA
	procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

- collect, organise and understand information related to work orders, plans and safety procedures for applying air dry and polyurethane enamel refinishing materials
- communicate ideas and information to enable confirmation of work requirements and specifications, coordination of work with worksite supervisor, other workers and customers, and the reporting of work outcomes and problems
- plan and organise activities, including preparation and layout of worksite and obtaining of equipment and materials to avoid backtracking, workflow interruptions or wastage
- work with others and in a team by recognising dependencies and using cooperative approaches to optimise workflow and productivity
- establish safe and effective work processes which anticipate and/or resolve problems and downtime, to systematically develop solutions to avoid or minimise reworking and avoid wastage
- use mathematical ideas and techniques to calculate time, apply accurate measurements, calculate material requirements and establish quality checks
- use workplace technology related to application of air dry and polyurethane enamel refinishing materials, including the use of specialist equipment, measuring equipment and communication devices and the reporting/recording of results

Required knowledge

A working knowledge of:

- WHS regulations/requirements, equipment, material and personal safety requirements
- environmental protection requirements/substance disposal and storage requirements
- material safety data sheets
- types of air dry and polyurethane enamel refinishing materials
- application methods
- paint surface fault identification and rectification procedures
- drying methods for air dry and polyurethane enamel refinishing material

REQUIRED SKILLS AND KNOWLEDGE

- types of spray guns
- spray gun operation and spraying techniques
- spray gun cleaning methods
- work organisation and planning processes
- enterprise quality processes

Evidence Guide**EVIDENCE GUIDE**

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment**Critical aspects for assessment and evidence required to demonstrate competency in this unit**

It is essential that competence is fully observed and there is ability to transfer competence to changing circumstances and to respond to unusual situations in the critical aspects of:

- observing safety procedures and requirements
- communicating effectively with others involved in or affected by the work
- selecting methods and techniques appropriate to the circumstances
- completing preparatory activity in a systematic manner
- preparing air dry and polyurethane enamel paint
- applying a range of air dry and polyurethane enamel refinishing materials
- identifying paint faults and determining rectification faults
- rectifying faults
- applying environmental procedures.

Context of, and specific resources for assessment

Application of competence is to be assessed in the workplace or simulated worksite.

Assessment is to occur using standard and authorised work practices, safety requirements and environmental constraints.

Assessment is to comply with regulatory requirements, including Australian Standards. The following resources should be made available:

- workplace location or simulated workplace
- materials relevant to application of air dry and

EVIDENCE GUIDE	
	<p>polyurethane enamel refinishing materials</p> <ul style="list-style-type: none"> • equipment, hand and power tooling appropriate to application of air dry and polyurethane enamel refinishing materials • activities covering mandatory task requirements • specifications and work instructions.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed assessment guidelines of the automotive industry's RS&R Training Package. • Assessment methods must confirm consistency and accuracy of performance together with application of underpinning knowledge. • Assessment must be by direct observation of tasks, with questioning on underpinning knowledge and it must also reinforce the integration of key competencies. • Assessment may be applied under project related conditions and require evidence of process. • Assessment must confirm a reasonable inference that competence is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • It is preferable that assessment reflects a process rather than an event and occurs over a period of time to cover varying quality circumstances. Range Statement

RANGE STATEMENT

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. **Essential** italicised wording, if used in the performance criteria, is detailed below. Essential

RANGE STATEMENT	
operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.	
Paint types	Paint types are to include air dry synthetic enamels, enamel additives, two-pack polyurethane acrylic enamels, urethane additives and paint reducers.
Methods	Methods are to include: <ul style="list-style-type: none"> • spray gun selection, various spraying techniques, drying procedures, paint mixing • polishing and detailing of surfaces.
WHS	WHS requirements are to be in accordance with legislation/regulations/codes of practice and enterprise safety policies and procedures. This may include protective clothing and equipment, use of tooling and equipment, workplace environment and safety, handling of materials, use of fire fighting equipment, enterprise first aid, hazard control and hazardous materials and substances.
Personal protective equipment	Personal protective equipment is to include that prescribed under legislation/regulation/codes of practice and workplace policies and practices.
Safe operating procedures	Safe operating procedures are to include, but are not limited to operational risk assessment and treatments associated with vehicular movement, toxic substances, electrical safety, machinery movement and operation, manual and mechanical lifting and shifting, working in proximity to others and worksite visitors.
Emergency procedures	Emergency procedures related to this unit are to include, but are not limited to emergency shutdown and stopping of equipment, extinguishing fires, enterprise first aid requirements and worksite evacuation.
Environmental requirements	Environmental requirements are to include but are not limited to waste management, noise, dust and clean-up management.

RANGE STATEMENT	
Quality requirements	Quality requirements are to include, but are not limited to regulations, including Australian Standards, internal company quality policy and standards and enterprise operations and procedures.
Statutory/regulatory authorities	Statutory/regulatory authorities may include Federal, State/Territory and local authorities administering acts, regulations and codes of practice.
Tooling and equipment	Tooling and equipment may include various spray guns, air pressure regulators, air compressors, spray booths, baking ovens, heating and lighting systems, strainers, masking equipment and safety equipment.
Materials	Materials may include rags, tac rags, cleaning solvents and cleaning materials.
Communications	Communications are to include, but are not limited to verbal and visual instructions and fault reporting and may include worksite specific instructions, written instructions, plans or instructions related to job/task, telephones and pagers.
Information/documents	<p>Sources of information/documents may include:</p> <ul style="list-style-type: none"> • verbal or written and graphical instructions, signage, work schedules/plans/specifications, work bulletins, memos, material safety data sheets, diagrams or sketches • safe work procedures related to application of air dry and polyurethane enamel refinishing materials • regulatory/legislative requirements pertaining to automotive painting and finishing • engineer's design specifications and instructions • organisation work specifications and requirements • instructions issued by authorised enterprise or external persons • Australian Standards.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.	Performance criteria describe the performance needed to demonstrate achievement of the element. Where bold italicised text is used, further information is detailed in the required skills and knowledge section and the range statement. Assessment of performance is to be consistent with the evidence guide.
---	--

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for work	<p>1.1. Work instructions are used to determine job requirements, including method, process and equipment.</p> <p>1.2. Job specifications are read and interpreted.</p> <p>1.3. Workplace health and safety (WHS) requirements, including personal safety needs, are observed throughout the work.</p> <p>1.4. Equipment and tooling are identified and checked for safe and effective operation.</p> <p>1.5. Procedures are determined to minimise task time.</p>
2. Match material	<p>2.1. Information is accessed and interpreted from manufacturer/ component supplier specifications.</p> <p>2.2. Matching procedures are carried out in accordance with manufacturer/component supplier</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>specifications.</p> <p>2.3. Matching procedures are completed within established industry enterprise guidelines.</p> <p>2.4. Activities are carried out according to industry regulations/ guidelines, WHS requirements, legislation and enterprise procedures/policies.</p>
3. Measure and cut material	<p>3.1. Information is accessed and interpreted from manufacturer/ component supplier specifications.</p> <p>3.2. Measuring and cutting procedures are carried out in accordance with manufacturer/component supplier specifications.</p> <p>3.3. Measuring and cutting procedures are completed within established industry enterprise guidelines.</p> <p>3.4. Activities are carried out according to industry regulations/ guidelines, WHS requirements, legislation and enterprise procedures/policies.</p>
4. Fabricate trim/covers to suit vehicle/ components	<p>4.1. Information is accessed and interpreted from manufacturer/ component supplier specifications.</p> <p>4.2. Trim/cover fabrication procedures are carried out in accordance with manufacturer/component supplier specifications.</p> <p>4.3. Fabrication procedures are completed within established industry enterprise guidelines.</p> <p>4.4. Activities are carried out according to industry regulations/guidelines, WHS requirements, legislation and enterprise procedures/policies.</p>
5. Attach material cover to vehicle/component	<p>5.1. Information is accessed and interpreted from manufacturer/ component supplier specifications.</p> <p>5.2. Attaching procedures are carried out in accordance with manufacturer/component supplier specifications.</p> <p>5.3. Attaching procedures are completed within established industry/enterprise guidelines.</p> <p>5.4. Activities are carried out according to industry regulations/ guidelines, WHS requirements, legislation and enterprise procedures/policies.</p>
6. Clean up work area and maintain equipment	<p>6.1. Material that can be reused is collected and stored.</p> <p>6.2. Waste and scrap is removed following workplace procedure.</p> <p>6.3. Equipment and work area are cleaned and inspected for serviceable condition in accordance with</p>

ELEMENT	PERFORMANCE CRITERIA
	<p>workplace procedures.</p> <p>6.4. Unserviceable equipment is tagged and faults identified in accordance with workplace requirements.</p> <p>6.5. Operator maintenance is completed in accordance with manufacturer/component supplier specifications and worksite procedures.</p> <p>6.6. Tooling and equipment is maintained in accordance with workplace procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- collect, organise and understand information related to work orders, plans and safety procedures for trimming of vehicle components
- technical literacy and communication skills sufficient to interpret and apply common industry terminology, and interpret technical information and specifications
- research and interpretive skills to locate, interpret and apply operational and safety information
- communicate ideas and information to enable confirmation of work requirements and specifications, coordination of work with worksite supervisor, other workers and customers, and the reporting of work outcomes and problems
- plain English literacy and communication skills in relation to dealing with others involved in the work
- questioning and active listening skills, for example when obtaining information regarding trimming requirements
- plan and organise activities, including preparation and layout of worksite and obtaining of equipment and material to avoid backtracking or workflow interruptions
- work with others and in a team by recognising dependencies and using cooperative approaches to optimise workflow and productivity
- use mathematical ideas and techniques to complete tests and measurements to determine trimming requirements
- use pre-checking and inspection techniques to anticipate planning and scheduling

REQUIRED SKILLS AND KNOWLEDGE

problems, avoid wastage of time and material

- manipulative and dexterity skills to perform trimming activities
- problem-solving skills for a range of differing procedural issues
- use workplace technology related to carrying out trimming of vehicle components, including the use of specialist tooling, measuring equipment and communication devices and the reporting/documenting of results

Required knowledge

Required knowledge includes:

- WHS cleaning materials, equipment, material and personal safety requirements
- removal and replacement methods
- measuring/testing and adjustment procedures
- technical and legal requirements
- manufacturer/component supplier/company policies
- types and uses of various materials
- trim fabrication, matching, measuring and cutting procedures
- use of tooling and equipment
- work organisation and planning processes
- enterprise quality processes

Evidence Guide

EVIDENCE GUIDE

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment

Critical aspects for assessment and evidence required to demonstrate competency in this unit

It is essential that competence is fully observed and there is ability to transfer competence to changing circumstances and to respond to unusual situations in the critical aspects of:

- observing safety procedures and requirements
- communicating effectively with others involved in or affected by the work
- selecting methods and techniques appropriate to the circumstances
- completing preparatory activity in a systematic manner

EVIDENCE GUIDE	
	<ul style="list-style-type: none"> • fabricating covers/trims • repairing material covers/trims • replacing material covers/trims • adjusting material covers/trims • completing workplace records.
Context of, and specific resources for assessment	<ul style="list-style-type: none"> • Application of competence is to be assessed in the workplace or simulated worksite. • Assessment is to occur using standard and authorised work practices, safety requirements and environmental constraints. • Assessment is to comply with regulatory requirements, including Australian Standards. • The following resources should be made available: <ul style="list-style-type: none"> • workplace location or simulated workplace • material relevant to carrying out trimming of vehicle components • equipment, hand and power tooling appropriate to carrying out trimming of vehicle components • activities covering mandatory task requirements • specifications and work instructions.
Method of assessment	<ul style="list-style-type: none"> • Assessment must satisfy the endorsed Assessment Guidelines of the Automotive Industry Retail, Service and Repair Training Package. • Assessment methods must confirm consistency and accuracy of performance together with application of underpinning knowledge. • Assessment must be by direct observation of tasks, with questioning on underpinning knowledge and it must also reinforce the integration of key competencies. • Assessment may be applied under project-related conditions and require evidence of process. • Assessment must confirm a reasonable inference that competence is able not only to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • It is preferable that assessment reflects a process rather than an event and occurs over a period of time to cover varying quality circumstances. Evidence of performance may be provided by customers, team leaders/members or other persons subject to agreed authentication arrangements. • Competence in this unit may be assessed in conjunction

EVIDENCE GUIDE

	with other functional units which together form part of the holistic work role.
--	---

Range Statement**RANGE STATEMENT**

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Trimming methods

Trimming methods are to include:

- sewing, gluing, riveting, cutting, forming and stapling

Vehicles

Vehicles may include:

- marine craft aircraft
- light and heavy vehicles and equipment

WHS

WHS requirements are to be in accordance with legislation/regulations/codes of practice and enterprise safety policies and procedures. This may include:

- protective clothing and equipment
- use of tooling and equipment
- workplace environment and safety
- handling of material
- use of firefighting equipment
- enterprise first aid
- hazard control and hazardous material and substances

Personal protective equipment

Personal protective equipment is to include that prescribed under legislation/regulation/codes of practice and workplace policies and practices

Safe operating procedures

Safe operating procedures are to include, but are not limited to:

- operational risk assessment and treatments

RANGE STATEMENT	
	associated with vehicular movement, toxic substances, electrical safety, machinery movement and operation, manual and mechanical lifting and shifting, working in proximity to others and worksite visitors.
Emergency procedures	Emergency procedures related to this unit are to include, but are not limited to: <ul style="list-style-type: none"> • emergency shutdown and stopping of equipment • extinguishing fires • enterprise first aid requirements • worksite evacuation
Environmental requirements	Environmental requirements are to include but are not limited to waste management, noise, dust and clean-up management
Quality requirements	Quality requirements are to include, but are not limited to: <ul style="list-style-type: none"> • regulations, including Australian standards • internal company quality policies and standards • enterprise operations and procedures
Statutory/regulatory authorities	Statutory/regulatory authorities may include: <ul style="list-style-type: none"> • federal, state/territory and local authorities administering Acts, regulations and codes of practice
Tooling and equipment	Tooling and equipment may include: <ul style="list-style-type: none"> • hand tooling • power/air tooling • specialist tooling for dismantling/assembly • staple gun • hammers • wad punches • heat gun • foam cutter • scissors and knives • revolving hole punch • ruler and tape • hand clamps

RANGE STATEMENT	
	<ul style="list-style-type: none"> • adhesive gun • pop rivet kit • punch and die set • hog ring pliers • door handle remover • hacksaw • sander • staple and tack remover • scrapers and putty knives • stuffing irons • vacuum formers
Materials	<p>Materials may include:</p> <ul style="list-style-type: none"> • fabrics and cleaning materials
Communications	<p>Communications are to include, but are not limited to:</p> <ul style="list-style-type: none"> • verbal and visual instructions and fault reporting and may include worksite specific instructions, written instructions, plans or instructions related to job/task, telephones and pagers
Information/documents	<p>Sources of information/documents may include:</p> <ul style="list-style-type: none"> • verbal or written and graphical instructions, signage, work schedules/plans/specifications, work bulletins, memos, material safety data sheets (MSDS), diagrams or sketches • Safe work procedures related to carrying out trimming of vehicle components • Regulatory/legislative requirements pertaining to automotive industry, including Australian Design Rules • Engineer's design specifications and instructions • Organisation work specifications and requirements • Instructions issued by authorised enterprise or external persons • Australian standards

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for work	1.1. Work instructions are used to determine job requirements, including method, process and equipment. 1.2. Job specifications are read and interpreted. 1.3. Workplace health and safety (WHS) requirements, including personal safety needs, are observed throughout the work. 1.4. Equipment and tooling are identified and checked for safe and effective operation. 1.5. Procedures are determined to minimise task time.
2. Select trim/fabric materials	2.1. Information is accessed and interpreted from manufacturer/ component supplier specifications. 2.2. Material applications and usages are compared with the job requirements.

ELEMENT	PERFORMANCE CRITERIA
	<p>2.3. The material selected is that which best meets the user requirement.</p> <p>2.4. Activities are carried out according to industry regulations/ guidelines, WHS requirements, legislation and enterprise procedures/policies.</p>
3. Determine attachment methods	<p>3.1. Information is accessed and interpreted from manufacturer/ component supplier specifications.</p> <p>3.2. Attachment options are identified and analysed.</p> <p>3.3. Attachment option is selected.</p> <p>3.4. Selected option is documented.</p>
4. Clean up work area and maintain equipment	<p>4.1. Equipment and work area are cleaned and inspected for serviceable condition in accordance with workplace procedures.</p> <p>4.2. Operator maintenance is completed in accordance with manufacturer/component supplier specifications and worksite procedures.</p> <p>4.3. Equipment is maintained in accordance with workplace procedures.</p>

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- collect, organise and understand information related to work orders, plans and safety procedures for selection and application of trim/fabric materials
- technical literacy and communication skills sufficient to interpret and apply common industry terminology, and interpret technical information and specifications
- research and interpretive skills to locate, interpret and apply operational and safety information
- communicate ideas and information to enable confirmation of work requirements and specifications, coordination of work with worksite supervisor, other workers and customers, and the reporting of work outcomes and problems
- plain English literacy and communication skills in relation to dealing with others involved in the work

REQUIRED SKILLS AND KNOWLEDGE

- questioning and active listening skills, for example when obtaining information relating to selection and application of trim/fabric materials
- plan and organise activities, including preparation and layout of worksite and obtaining of equipment and material to avoid backtracking or workflow interruptions
- work with others and in a team by recognising dependencies and using cooperative approaches to optimise workflow and productivity
- use mathematical ideas and techniques to complete tests and measurements to determine selection and application of trim/fabric materials
- establish safe and effective work processes which anticipate and/or resolve problems and downtime, to systematically develop solutions to avoid or minimise reworking and wastage
- use workplace technology related to selection and application of trim/fabric materials, including the use of measuring equipment, computerised technology and communication devices and the reporting/documenting of results

Required knowledge

Required knowledge includes:

- WHS cleaning materials, equipment, material and personal safety requirements
- manufacturer/component supplier/company specifications
- trim/fabric material types and their application
- selection procedures to determine trim/fabric material requirements
- methods of attachment of trim/fabric materials
- work organisation and planning processes
- enterprise quality processes

Unit Descriptor

Unit Descriptor

This unit involves the skills and knowledge required to marshal aircraft during start/shutdown phases, by day and night, and to direct aircraft movements as ground personnel using standard aircraft marshalling signals. Licensing, legislative, regulatory or certification requirements are applicable to this unit.

Application of the Unit

Application of the Unit

Work must be carried out in accordance with workplace procedures and the relevant regulatory requirements of the Civil Aviation Safety Authority (CASA) and other relevant regulatory authorities.

Use for ADF Aviation is to be in accordance with relevant Defence Orders and Instructions and applicable CASA compliance.

Operations are conducted across a variety of operational contexts within the Australian aviation industry.

Work is performed under limited supervision within organisational guidelines. Work may be conducted as part of a team.

This unit of competency is nominally packaged at Certificate III.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

Employability Skills This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the evidence guide.

Elements and Performance Criteria

ELEMENT

PERFORMANCE CRITERIA

- | | |
|---|---|
| 1 Prepare for marshalling | <ul style="list-style-type: none"> 1.1 Arrival/departure information is received and processed in accordance with workplace procedures 1.2 Marshalling requirements for different aircraft types are determined and requirements are clarified where required 1.3 Personal protective equipment is selected and fitted 1.4 Occupational health and safety (OH&S) requirements and recognised safety precautions are applied throughout the operation 1.5 Allocated aircraft parking position is confirmed 1.6 Marshalling, aircraft parking and ancillary support equipment is selected and checked for serviceability 1.7 Relevant documentation is completed in accordance with workplace procedures |
| 2 Establish/disestablish aircraft parking position | <ul style="list-style-type: none"> 2.1 Marshalling, aircraft parking, and ancillary support equipment is positioned and used in accordance with manufacturers instructions and workplace procedures 2.2 Movement is conducted in a safe manner in accordance with workplace procedures 2.3 Environmental factors are monitored to ensure safety is maintained |
| 3 Conduct aircraft marshalling | <ul style="list-style-type: none"> 3.1 Special circumstances/procedures during aircraft marshalling are allowed for 3.2 Standard marshalling signals and/or communications are employed 3.3 Visual contact with the pilot, other aircrew and/or ground staff is maintained |

ELEMENT

PERFORMANCE CRITERIA

- 3.4 Safety distances between aircraft and ground personnel/obstructions are identified and maintained
- 3.5 Emergency actions are conducted in the event of an aircraft fire or other incident, in accordance with workplace procedures
- 3.6 Aircraft is secured/unsecured in accordance with workplace procedures
- 3.7 Allowances are made for wind direction and velocity
- 3.8 Effects of rotor wash and/or engine thrust on personnel and unsecured objects are taken into consideration

Required Skills and Knowledge

REQUIRED KNOWLEDGE AND SKILLS

This describes the essential knowledge and skills and their level required for this unit.

Required knowledge:

- Regulations, legislation, organisational policy and procedures in relation to marshalling aircraft
- Aircraft danger zones
- Day and night marshalling signals
- Effects of wind on aircraft
- Landing/taking-off and starting of aircraft
- Marshalling, ground support and aircraft equipment selection and serviceability
- Procedures in the event of an aircraft fire, accident and emergency
- Aircraft operating restrictions in confined areas
- Security and access requirements
- Workplace procedures applicable to marshalling aircraft
- Manufacturers instructions for equipment used for marshalling aircraft
- Risks that exist when marshalling aircraft and related risk control procedures and precautions
- Problems that may occur when marshalling aircraft and appropriate action that should be taken in each case

Required skills:

- Implement aircraft security and access procedures
- Use standard hand signals
- Identify and correctly use marshalling and ancillary support equipment

REQUIRED KNOWLEDGE AND SKILLS

- Communicate effectively with others when marshalling aircraft
- Read, interpret and follow instructions, regulations, procedures and other information relevant to marshalling aircraft
- Complete documentation related to marshalling aircraft
- Work collaboratively with others when marshalling aircraft
- Adapt appropriately to cultural differences in the workplace, including modes of behaviour and interactions with others
- Promptly report and/or rectify any identified problems that may occur when marshalling aircraft in accordance with regulatory requirements and workplace procedures
- Implement contingency plans for unexpected events that may arise when marshalling aircraft
- Apply precautions and required action to minimise, control or eliminate hazards that may exist when marshalling aircraft
- Monitor and anticipate operational problems and hazards and take appropriate action
- Monitor work activities in terms of planned schedule
- Modify activities dependent on differing workplace contingencies, situations and environments
- Work systematically with required attention to detail without injury to self, others or damage to goods or equipment
- Adapt to differences in equipment and operating environment in accordance with standard operating procedures
- Select and use required personal protective clothing and equipment conforming to industry and OH&S standards
- Implement OH&S procedures and relevant regulations

Evidence Guide

EVIDENCE GUIDE

The Evidence Guide provides advice on assessment and must be read in conjunction with the performance criteria, required knowledge and skills, the range statement and the assessment guidelines for this Training Package.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

- The evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria of this unit and include demonstration of:
 - applying the underpinning knowledge and skills
 - preparing marshalling including selecting and fitting personal protective equipment
 - conducting movement in a safe manner in accordance with workplace procedures

EVIDENCE GUIDE

- monitoring environmental factors to ensure safety is maintained
 - employing standard marshalling signals and/or communications
 - maintaining visual contact and safety distances
 - conducting emergency actions in the event of an aircraft fire or other incident in accordance with workplace procedures
- Context of and specific resources for assessment**
- Performance is demonstrated consistently over a period of time and in a suitable range of contexts
 - Resources for assessment include:
 - a range of relevant exercises, case studies and/or other simulated practical and knowledge assessment, and/or
 - access to an appropriate range of relevant operational situations in the workplace
 - In both real and simulated environments, access is required to:
 - relevant and appropriate materials and equipment, and
 - applicable documentation including workplace procedures, regulations, codes of practice and operation manuals
- Method of assessment**
- Assessment of this unit must be undertaken by a registered training organisation
 - As a minimum, assessment of knowledge must be conducted through appropriate written/oral tests
 - Practical assessment must occur:
 - through activities in an appropriately simulated environment at the registered training organisation, and/or
 - in an appropriate range of situations in the workplace

Range Statement

RANGE STATEMENT

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance.

Aircraft may include:

- fixed wing
- in any weather conditions
- other airborne vehicles

RANGE STATEMENT

Marshalling operations may include:

- day and night
- variable weather conditions
- international, domestic and regional airports
- helidecks

Marshalling context may include:

- start-up
- shutdown
- rotor engagement
- taxiing
- hover
- hover taxiing
- allocating and prioritising aircraft parking
- parking

Arrival and departure information may include:

- formalised tasking information
- informal tasking information for action in accordance with localised procedures
- informal information received by other means such as hand signals, phone, facsimile, email, text message or radio communications regarding aircraft safety (e.g. hot brakes, fuel leak, security)

Marshalling requirements for different aircraft types may include:

- access
- security

Personal protective equipment may include:

- eye goggles
- head protection
- hearing protection
- high visibility clothing
- protective overalls
- protective boots
- respiratory protection equipment

Marshalling equipment may include

- wands
- paddles
- flags
- torches

Aircraft parking equipment may include:

- covers and intake inserts (bungs)
- earthing leads
- flags
- magnetic pins
- mechanical locking devices
- tie-down devices
- wheel chocks

RANGE STATEMENT

Ancillary support equipment may include:

- access/egress equipment
- external aircraft power facilities
- fire extinguisher
- first aid kit
- parking markers and barriers

Dependent on the type of organisation concerned and the local terminology used, workplace procedures may include:

- Defence Instructions
- organisational policies
- company procedures
- enterprise procedures
- organisational procedures
- established procedures
- standard operating procedures
- written and verbal instructions

Special circumstances/procedures may include:

- negative rotation
- power sources
- safety requirements e.g. fire bottle attendants
- aircraft with no prop or rotor brake
- installation of locking, protection or security devices
- undercarriage lock pins
- safety pin requirements for aircraft carrying ordnance

Emergency actions may include:

- basic fire fighting
- basic first aid
- crowd control
- aircraft evacuation procedures
- notifying emergency services

Standard marshalling signals include:

- standard hand signals
- International Civil Aviation Organization (ICAO) signals

Information/documents may include:

- relevant sections of Civil Aviation Safety Regulations and Civil Aviation Orders
- in Defence context, relevant Defence Orders and Instructions
- operations manuals
- workplace procedures and instructions and job specification
- induction and training materials

Applicable regulations and legislation may include:

- relevant Civil Aviation Safety Regulations and Civil Aviation Orders
- in Defence context, relevant Defence Orders and Instructions
- relevant state/territory OH&S legislation

RANGE STATEMENT

Performance includes tolerances specified in either of:

- relevant state/territory environmental protection legislation
- relevant Australian Standards
- relevant licence and aircraft requirements of the Civil Aviation Safety Authority such as:
 - Day VFR syllabus
 - Manual of Standards
- relevant Defence documentation such as:
 - Defence Orders and Instructions
 - approved curricula and training documentation

Competency Field F - Safety Management

DEFEO101D Work safely with explosive ordnance

Modification History

Release	TP version	Comments
2	DEF12 V2	Layout adjusted.
1	DEF12 V1	First release.

Unit Descriptor

This unit covers the competency required to achieve a safe work environment when working with explosive ordnance.

Application of the Unit

This competency normally applies in any installation or organisation involved in the storage, distribution, maintenance and use of explosive ordnance; this includes research and development establishments, and proof and experimental establishments.

Explosive ordnance being all munitions containing explosives, nuclear fission or fusion materials, and biological and chemical agents.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a Unit of Competency.

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Where ***bold italicised*** text is used, further information is detailed in the Range Statement. Assessment of

performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Access and apply safety procedures	1.1 <i>Safety procedures and instructions</i> are accessed and clarified 1.2 All work is conducted within the requirements of <i>organisational</i> permit-to-work and/or tag out procedures 1.3 Breaches in site safety are identified and acted on or reported in accordance with organisational reporting procedures 1.4 Load handling and shifting procedures are selected in accordance with identified requirements for particular goods 1.5 Handling equipment is checked for conformity with workplace requirements and manufacturer's guidelines 1.6 Where relevant, suitable signage is checked for compliance with workplace procedures
2. Apply personal safety measures	2.1 <i>Personal protective measures</i> are followed in accordance with organisational policy and procedures 2.2 Safety of immediate working area and equipment is established and maintained in accordance with organisational policy, procedures and directives 2.3 Relevant authorisation is obtained before specialised and hazardous work is carried out in accordance with organisational procedures and directives
3. Apply dangerous goods and hazardous substances requirements	3.1 Individual responsibilities regarding <i>dangerous goods and hazardous substances</i> are recognised and applied 3.2 Legislative requirements for hazardous substances and/or dangerous goods are understood and are used to plan work activities 3.3 Dangerous goods and hazardous substances labels and characteristics are identified and recognised, and relevant action/criteria is applied 3.4 Confirmation is sought from relevant personnel where dangerous goods or hazardous materials do

ELEMENT	PERFORMANCE CRITERIA
4. Apply net explosive quantity and compatibility	<p>not appear to be appropriately marked</p> <p>3.5 Dangerous goods and hazardous substances are stored in accordance with the relevant compatibility, separation constraints and security requirements</p> <p>3.6 Dangerous goods and hazardous substances are handled and moved in accordance with legislative requirements and organisational procedures</p> <p>4.1 Documentation and licensing limitations are identified and/or acquired in accordance with organisational policy and procedures</p> <p>4.2 <i>Net explosive quantity</i> is applied in accordance with statutory requirements and organisational policy and procedures</p> <p>4.3 <i>Compatibility</i> is applied in accordance with statutory requirements and organisational policy and procedures</p>
5. Identify and report incidents	<p>5.1 Incidents and injuries are identified, recorded and <i>reported</i> in accordance with organisational procedures</p> <p>5.2 Participation in incident investigations is conducted in accordance with the responsibilities and protection under legislation</p>

Required Skills and Knowledge

This describes the essential skills and knowledge and their level, required for this unit.

Required Skills

- access, read, interpret and apply information on safety
- apply area safety procedures
- apply compatibility
- apply net explosive quantity
- apply safe manual handling procedures
- comply with hazardous materials requirements
- encourage other team members
- follow instructions/directives and report information
- identify and report hazards and incidents
- identify, select and use personal protection measures
- read to a level required to interpret job instructions, workplace forms and reports
- use a variety of verbal and non-verbal communication techniques

- write at the level required to complete workplace documentation and reports

Required Knowledge

- application of compatibility
- application of net explosive quantity
- composition of teams and roles and responsibilities of team members
- hazard and incident identification and reporting techniques
- hazardous materials requirements
- manual handling procedures
- organisational safety policies and structures
- organisational safety information sources
- personal protection measures
- safety and advisory signs
- team work
- techniques for supporting others
- verbal and non-verbal communication techniques
- written communication to a level required to complete workplace documentation and reports

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessment must confirm the ability to comply with organisational safety requirements, and appropriate legislative and regulatory requirements.

Assessment must also confirm the ability to work safely within an explosive ordnance environment and to:

- identify, select and use personal protective measures
- apply safe manual handling practices
- apply net explosive quantity
- apply compatibility
- identify and report hazards and incidents
- participate in incident investigations

Consistency in performance

Competency should be demonstrated over time and observed in a range of actual or simulated explosive ordnance contexts.

Context of and specific resources for assessment

Context of assessment

Competency should be assessed in the workplace or in a simulated work environment and in accordance with all relevant legislation and organisational requirements.

Evidence should be gathered through observation of the practical component and targeted questioning to assess required knowledge.

Specific resources for assessment

Access is required to:

- facilities and resources used in the storage, distribution or maintenance of explosive ordnance.

Method of assessment

In a public safety environment assessment is usually conducted via direct observation in a training environment or in the workplace via subject matter supervision and/or mentoring, which is typically recorded in a competency workbook.

Assessment is completed using appropriately qualified assessors who select the most appropriate method of assessment.

Assessment may occur in an operational environment or in an industry-approved simulated work environment. Forms of assessment that are typically used include:

- direct observation
- interviewing the candidate
- journals and workplace documentation
- third party reports from supervisors
- written or oral questions

Range Statement

The Range Statement relates to the Unit of Competency as a whole. It allows for different work environments and situations that may affect performance. ***Bold italicised*** wording in the Performance Criteria is detailed below.

Explosive ordnance may include:

- All munitions containing explosives, nuclear fission or fusion materials and biological and chemical agents, including:
- all mines, torpedoes and depth charges
- artillery, mortar, rocket and small arms ammunition
- bombs and warheads

Safety procedures and instructions may include:

Organisation may include:

Personal protective measures may include:

Dangerous goods and hazardous substances may include:

Net explosive quantity includes:

Compatibility is:

Reports may include:

- cartridge and propellant actuated devices
- clandestine and other improvised explosive devices
- clusters and dispensers
- demolition charges
- electro explosive devices
- guided and ballistic missiles
- pyrotechnics
- all similar or related items or components explosive in nature
- explosive ordnance governance regulations, policy and procedures
- organisational instructions
- defence organisation
- enterprises that work with explosive ordnance
- other government departments or instrumentalities that work with explosive ordnance
- adherence to all work health and safety (WHS) regulations, policy and procedures
- organisational instructions
- personal protective equipment
- any item that is identified by the UN Classification System for Dangerous Goods
- explosive capacity calculated in a wide range of activities related to the storage, distribution and maintenance of explosive ordnance
- applied in a wide range of activities related to the storage, distribution and maintenance of explosive ordnance and other hazardous materials
- approved forms
- verbal
- written

DEFEO301D Package ammunition

Modification History

Release	TP version	Comments
2	DEF12 V2	Layout adjusted.
1	DEF12 V1	First release.

Unit Descriptor

This unit covers the competency required to package ammunition, explosive ordnance and explosive components for transportation and storage.

Application of the Unit

This competency normally applies to the individual who is required to prepare, package and finalise documentation for ammunition, explosive ordnance and explosive components for the purpose of transportation and storage, where packaging includes painting, stencilling, marking, sealing strapping, vacuum evacuation and labelling.

The unit requires the individual to calculate net explosive quantity, apply compatibility constraints, mark the packaging with internationally recognised coding and maintain a range of documentation.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the Performance Criteria describe the required performance

essential outcomes of a Unit of Competency.

needed to demonstrate achievement of the element. Where ***bold italicised*** text is used, further information is detailed in the Range Statement. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for packaging	<p>1.1 <i>Packaging requirements</i> are identified from work requests/instructions and confirmed with relevant personnel</p> <p>1.2 Work health and safety (WHS) requirements, including those contained in <i>organisational</i> procedures, are applied throughout the operation</p> <p>1.3 <i>Technical references</i>, tools, equipment, consumables and packaging components are identified, acquired and prepared in accordance with organisational procedures</p> <p>1.4 <i>Net explosive quantities</i> and <i>compatibility</i> are identified, calculated, analysed and applied throughout the operation</p> <p>1.5 <i>Environmental conditions</i> are monitored and maintained in accordance with organisational policy</p>
2. Pack ammunition/explosive ordnance	<p>2.1 Ammunition/explosive ordnance or explosive components are identified and <i>prepared</i> for packaging in accordance with organisational policy and procedures</p> <p>2.2 Ammunition/explosive ordnance or explosive components are packaged in accordance with technical instructions, technical drawings and organisational procedures</p> <p>2.3 Emergency and contingency procedures are applied in accordance with organisational policy</p> <p>2.4 Packaging is prepared and marked in accordance with statutory and organisational requirements</p> <p>2.5 Unit load is assembled and prepared in accordance with shipping/storing requirements and organisational procedures</p> <p>2.6 Relevant <i>calculations</i> are carried out and recorded</p>
3. Finalise packaging procedures	<p>3.1 Equipment/tools are maintained in accordance with organisational policy and procedures</p>

ELEMENT**PERFORMANCE CRITERIA**

3.2 *Documentation and records* are maintained in accordance with statutory, organisational and workshop requirements

Required Skills and Knowledge

This describes the essential skills and knowledge and their level, required for this unit.

Required Skills

- apply colour coding, markings, stencilling and labels
- apply compatibility constraints
- apply environmental constraints
- apply moisture absorption procedures
- apply relevant WHS requirements
- apply operational safety
- apply sealing procedures
- calculate and maintain net explosive quantity
- calculate weight, volume and dimensions
- identify ammunition/explosive ordnance and packaging materials
- maintain documentation
- package ammunition/explosive ordnance
- read, access, interpret and apply technical instructions and drawings related to packaging of ammunition/explosive ordnance
- purge ammunition and package
- use relevant tools and equipment

Required Knowledge

- ammunition/explosive ordnance to be packaged
- appropriate ammunition/explosive ordnance packaging
- colour coding, markings, stencilling and labelling requirements
- compatibility constraints
- documentation requirements
- effects of environmental conditions
- heat and/or vacuum sealing procedures
- moisture absorption procedures
- net explosive quantity calculations
- operation and limitations of packaging tools and equipment
- operational safety
- packaging procedures

- purging procedures
- relevant WHS requirements
- weight volume and dimension calculations
- work condition class

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessment must confirm the ability to:

- adhere to relevant WHS requirements and operational safety
- identify and select appropriate packaging materials and components
- package ammunition
- mark and label packaged ammunition/explosive ordnance
- maintain documentation

Consistency in performance

Competency should be demonstrated over time and in a range of actual or simulated explosive ordnance contexts.

Context of and specific resources for assessment

Context of assessment

Competency should be assessed in the workplace or under conditions which accurately simulate a realistic workplace in accordance with all relevant legislation and organisational requirements.

Evidence should be gathered through observation of the practical component and targeted questioning to assess required knowledge.

Specific resources for assessment

Access is required to:

- facilities and resources used in the packaging, storage, distribution and maintenance of explosive ordnance, including a licensed explosive site

Method of assessment

This unit may be assessed with the following unit:

- DEFEO101D Work safely with explosive ordnance.

In a public safety environment assessment is usually conducted via direct observation in a training environment or in the workplace via subject matter supervision and/or mentoring, which is typically recorded in a competency workbook.

Assessment is completed using appropriately qualified assessors who select the most appropriate method of assessment.

Assessment may occur in an operational environment or in an industry-approved simulated work environment.

Forms of assessment that are typically used include:

- direct observation
- interviewing the candidate
- journals and workplace documentation
- third party reports from supervisors
- written or oral questions

of Competency.

detailed in the Range Statement. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for unpackaging	<p>1.1 <i>Unpackaging requirements</i> are identified from work requests/instructions and are confirmed with relevant personnel</p> <p>1.2 Work health and safety (WHS) requirements, including those contained in <i>organisational</i> procedures, are applied throughout the operation</p> <p>1.3 <i>Technical references</i>, tools and equipment are identified, acquired and prepared in accordance with organisational procedures</p> <p>1.4 <i>Net explosive quantities</i> and <i>compatibility</i> are identified, calculated, analysed and applied throughout the operation</p> <p>1.5 Emergency and contingency procedures are applied in accordance with organisational policy</p> <p>1.6 <i>Environmental conditions</i> are monitored and maintained in accordance with organisational policy</p>
2. Unpack ammunition/explosive ordnance	<p>2.1 Ammunition/explosive ordnance or explosive components are prepared for unpackaging in accordance with organisational policy and procedures</p> <p>2.2 Ammunition/explosive ordnance or explosive components are unpackaged in accordance with technical instructions, technical drawings and organisational procedures</p> <p>2.3 Packaging material is stored or disposed of in accordance with statutory and organisational policy</p> <p>2.4 Relevant <i>calculations</i> are carried out and recorded</p>
3. Finalise unpackaging procedures	<p>3.1 Equipment/tools are maintained in accordance with organisational policy and procedures</p> <p>3.2 <i>Documentation and records</i> are maintained in accordance with statutory, organisational and workshop requirements</p>

Required Skills and Knowledge

This describes the essential skills and knowledge and their level, required for this unit.

Required Skills

- apply anti static procedures
- apply compatibility constraints
- apply environmental constraints
- apply operational safety
- apply relevant WHS requirements
- calculate and maintain net explosive quantity
- identify ammunition/explosive ordnance and packaging materials
- identify colour codings, markings and labels
- maintain documentation
- read, access, interpret and apply technical instructions and drawings related to packaging of ammunition/explosive ordnance
- use unpackaging tools and equipment
- vent containers

Required Knowledge

- ammunition/explosive ordnance to be unpackaged
- anti static procedures
- appropriate ammunition/explosive ordnance packaging
- colour coding, markings
- compatibility constraints
- documentation requirements
- effects of environmental conditions
- net explosive quantity calculations
- operational safety
- operations and limitations of unpackaging tools and equipment
- relevant WHS requirements
- work condition class
- venting procedures

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

Critical aspects for assessment and evidence

Assessment must confirm the ability to:

- adhere to relevant WHS requirements and

required to demonstrate competency in this unit

- operational safety
- identify and select appropriate unpackaging tools and equipment
- maintain documentation.

Consistency in performance

Competency should be demonstrated over time and in a range of actual or simulated explosive ordnance contexts.

Context of and specific resources for assessment**Context of assessment**

Competency should be assessed in the workplace or under conditions which accurately simulate a realistic workplace in accordance with all relevant legislation and organisational requirements.

Evidence should be gathered through observation of the practical component and targeted questioning to assess required knowledge.

Specific resources for assessment

Access is required to:

- facilities and resources used in the packaging, storage, distribution and maintenance of explosive ordnance, including a licensed explosive site.

Method of assessment

This unit may be assessed with the following unit:

- DEFEO101D Work safely with explosive ordnance.

In a public safety environment assessment is usually conducted via direct observation in a training environment or in the workplace via subject matter supervision and/or mentoring, which is typically recorded in a competency workbook.

Assessment is completed using appropriately qualified assessors who select the most appropriate method of assessment.

Assessment may occur in an operational environment or in an industry-approved simulated work environment. Forms of assessment that are typically used include:

- direct observation
- interviewing the candidate
- journals and workplace documentation
- third party reports from supervisors
- written or oral questions

Range Statement

DEFEO501D Conduct explosive ordnance inspection

Modification History

Release	TP version	Comments
2	DEF12 V2	Layout adjusted.
1	DEF12 V1	First release.

Unit Descriptor

This unit covers the competency required to conduct an inspection on all types of explosive ordnance in order to assess its condition and to process further action.

Application of the Unit

This competency normally applies to the individual who is required to conduct an inspection on all types of explosive ordnance in order to assess its condition and to process the explosive ordnance for further action.

The inspection of the explosive ordnance is carried out in a logical sequence while adhering to all relevant work health and safety (WHS) requirements. How the explosive ordnance is processed is subject to the outcomes of the inspection. In the case of defective or damaged explosive ordnance it may be retained and returned to the manufacturer, maintained or disposed of, or restrictions may be placed on its use.

Licensing/Regulatory Information

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a Unit of Competency.

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Where ***bold italicised*** text is used, further information is detailed in the Range Statement. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for inspection	<p>1.1 Requirement for <i>explosive ordnance inspection</i> is identified from work requests/instructions and confirmed</p> <p>1.2 WHS requirements, including those contained in <i>organisational</i> procedures, are applied throughout the operation</p> <p>1.3 <i>Technical references</i>, tools and equipment required for the inspection are identified, acquired and prepared in accordance with organisation procedures</p> <p>1.4 Explosive ordnance is acquired, identified and accounted for, moved or pre-positioned in preparation for inspection</p> <p>1.5 <i>Net explosive quantities</i> and <i>compatibility</i> are identified, calculated, assessed and applied throughout the operation</p>
2. Inspect explosive ordnance	<p>2.1 Explosive ordnance is <i>inspected</i> in a logical set sequence to ensure that <i>defects or damage</i> are not overlooked in accordance with organisation policy and procedures and technical specifications</p> <p>2.2 Damage or other defects are identified and recorded in accordance with organisation procedures</p>
3. Carry out post inspection procedures	<p>3.1 Explosive ordnance is <i>processed</i> in accordance with organisation procedures</p> <p>3.2 <i>Documentation and records</i> are maintained in accordance with statutory, organisation and workshop requirements</p>

Required Skills and Knowledge

This describes the essential skills and knowledge and their level, required for this unit.

Required Skills

- apply compatibility constraints
- apply safety policies and structures
- apply WHS requirements
- calculate net explosive quantity
- communicate orally and in writing
- maintain documentation
- read, access, interpret and apply technical instructions and drawings related to explosive ordnance inspections
- use relevant tools and equipment

Required Knowledge

- assessment of compatibility
- calculation of net explosive quantity
- characteristics and limitations of explosive ordnance to be inspected
- inspection procedures
- organisational documentation requirements
- organisational WH&S requirements
- organisational safety policies and structures

Evidence Guide

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessment must confirm the ability to comply with:

- organisational safety requirements
- appropriate legislative and regulatory requirements.

Assessment must also confirm the ability to work safely within an explosive ordnance environment and to:

- calculate and apply net explosive quantity
- assess and apply compatibility
- process explosive ordnance
- maintain documentation

Consistency in performance

Competency should be demonstrated in a range of actual or simulated explosive ordnance contexts.

Context of and specific resources for assessment

Context of assessment

Competency should be assessed in the workplace or in a simulated work environment, in accordance with all relevant legislation and organisation requirements.

Specific resources for assessment

Access is required to:

- facilities and resources used in the storage, distribution or maintenance of explosive ordnance, including a licensed explosive site

Method of assessment

This unit may be assessed with the following unit:

- DEFEO101D Work safely with explosive ordnance.

In a public safety environment assessment is usually conducted via direct observation in a training environment or in the workplace via subject matter supervision and/or mentoring, which is typically recorded in a competency workbook.

Assessment is completed using appropriately qualified assessors who select the most appropriate method of assessment.

Assessment may occur in an operational environment or in an industry-approved simulated work environment. Forms of assessment that are typically used include:

- direct observation
- interviewing the candidate
- journals and workplace documentation
- third party reports from supervisors
- written or oral questions

Range Statement

The Range Statement relates to the Unit of Competency as a whole. It allows for different work environments and situations that may affect performance. ***Bold italicised*** wording in the Performance Criteria is detailed below.

Explosive ordnance inspections may be conducted:

- As part of a work program
- On direction
- On receipt
- Prior to maintenance
- Prior to or post any activity
- And may include inspection to confirm free from

	explosives, the use of special measuring devices, gauges and locally patented tools
Organisation may include:	<ul style="list-style-type: none"> • Defence organisation • Enterprises that work with explosive ordnance • Other government departments or instrumentalities that work with explosive ordnance
Technical references may include:	<ul style="list-style-type: none"> • Technical drawings • Technical reference pamphlets • Orders and instructions • Other publications
Net explosive quantities include:	<ul style="list-style-type: none"> • Explosive capacity calculated in a wide range of activities related to the storage, distribution and maintenance of explosive ordnance
Compatibility is:	<ul style="list-style-type: none"> • Assessed in a wide range of activities related to the storage, distribution and maintenance of explosive ordnance and other hazardous materials
Inspection may result in explosive ordnance being:	<ul style="list-style-type: none"> • Passed for use • Recommended for sentencing • Rejected
Explosive ordnance defects or damage may include:	<ul style="list-style-type: none"> • Non-compliance with technical specifications • Corrosion • Surface damage
Processing may include:	<ul style="list-style-type: none"> • Disposal, including: <ul style="list-style-type: none"> • jettisoning • ditching • destruction • restrictions on use • Retention for return or maintenance
Documentation and records may include:	<ul style="list-style-type: none"> • Receipt and issue records • Timesheets • Work records

DEFEO718C Maintain cartridge operated fire extinguisher systems

Modification History

Release	TP version	Comments
2	DEF12 V2	Layout adjusted.
1	DEF12 V1	First release.

Unit Descriptor

This unit covers the competency required to maintain cartridge operated fire extinguishers which contain explosive ordnance.

Application of the Unit

This competency normally applies to the individual who is required to conduct maintenance on cartridge operated fire extinguishers which contain explosive ordnance.

It includes the attachment of safety devices to the fire extinguishers while they are being maintained and the testing of the explosive ordnance cartridge in the fire extinguisher.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

Not applicable.

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a Unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element.

of Competency.

Where ***bold italicised*** text is used, further information is detailed in the Range Statement. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1. Prepare for the maintenance of fire extinguishers	<p>1.1 Requirement for <i>cartridge operated fire extinguishers</i> maintenance is identified from work requests/instructions and is confirmed</p> <p>1.2 Work health and safety (WHS) requirements, including those contained in organisational procedures, are applied throughout the operation</p> <p>1.3 <i>Technical references</i>, tools and equipment required for the maintenance are identified, acquired and prepared in accordance with organisational procedures</p> <p>1.4 Safety devices appropriate to the fire extinguisher are installed prior to and on completion of, any maintenance in accordance with organisational procedures</p>
2. Maintain fire extinguishers	<p>2.1 Fire extinguishers are inspected in accordance with organisational policy and procedures</p> <p>2.2 <i>Relevant maintenance</i> is conducted in accordance with organisational procedures, technical specifications and drawings</p> <p>2.3 Emergency and contingency procedures are applied in accordance with organisational policy</p> <p>2.4 Relevant <i>tests</i> are conducted and recorded in accordance with organisational procedures, technical specifications and drawings</p>
3. Finalise the maintenance operation	<p>3.1 Fire extinguishers are processed in accordance with the requirements specified in the work request</p> <p>3.2 Equipment/tools are maintained in accordance with organisational policy and procedures</p> <p>3.3 Housekeeping procedures are conducted in accordance with workshop requirements</p> <p>3.4 <i>Documentation and records</i> are maintained in accordance with statutory, <i>organisation</i> and workshop requirements</p>

Required Skills and Knowledge

This describes the essential skills and knowledge and their level, required for this unit.

Required Skills

- apply environmental constraints
- apply operational safety
- apply relevant WHS requirements
- communicate orally and in writing
- conduct tests
- identify and select appropriate tools and equipment
- identify appropriate cartridge operated fire extinguishers
- maintain documentation
- use tools and equipment

Required Knowledge

- colour coding, marking and labels
- documentation requirements
- effects of environmental conditions
- maintenance procedures
- operational safety
- operations, characteristics and limitations of cartridge operated fire extinguishers to be maintained
- operations, characteristics and limitations of tools and equipment used in maintenance
- relevant WHS requirements
- testing procedures

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

Critical aspects for assessment and evidence required to demonstrate competency in this unit

Assessment must confirm the ability to comply with:

- organisational safety requirements
- appropriate legislative and regulatory requirements while maintaining fire extinguishers

Assessment must also confirm the ability to:

- work safely within an explosive ordnance environment
- calculate and apply net explosive quantity
- assess and apply compatibility
- conduct relevant tests
- maintain documentation

Consistency in performance

Competency should be demonstrated in a range of actual or simulated explosive ordnance contexts.

Context of and specific resources for assessment

Context of assessment

Competency should be assessed in the workplace or in a simulated workplace environment, in accordance with all relevant legislation and organisational requirements.

Specific resources for assessment

Access is required to:

- facilities and resources used in the storage, distribution or maintenance of explosive ordnance, including a licensed explosive site

Method of assessment

This unit may be assessed with the following unit:

- DEFEO101D Work safely with explosive ordnance.

In a public safety environment assessment is usually conducted via direct observation in a training environment or in the workplace via subject matter supervision and/or mentoring, which is typically recorded in a competency workbook.

Assessment is completed using appropriately qualified assessors who select the most appropriate method of assessment.

Assessment may occur in an operational environment or in an industry-approved simulated work environment.

Forms of assessment that are typically used include:

- direct observation
- interviewing the candidate
- journals and workplace documentation
- third party reports from supervisors
- written or oral questions

Range Statement

<p>The Range Statement relates to the Unit of Competency as a whole. It allows for different work environments and situations that may affect performance. <i>Bold italicised</i> wording in the Performance Criteria is detailed below.</p>	
<p><i>Cartridge operated fire extinguishers</i> may include:</p>	<ul style="list-style-type: none"> • All items currently on the Australian Defence Force in-service Cartridge operated fire extinguisher inventory • Cartridge operated fire extinguishers in aircraft and armoured vehicles
<p><i>Technical references</i> may include:</p>	<ul style="list-style-type: none"> • Orders and instructions • Technical drawings • Technical reference pamphlets • Other publications
<p><i>Relevant maintenance</i> may include:</p>	<ul style="list-style-type: none"> • Arming and de-arming • Cartridge fitment • Cleaning • Components change out • Painting
<p><i>Tests</i> may include:</p>	<ul style="list-style-type: none"> • Continuity tests • Gauging • Measuring
<p><i>Processing</i> may include:</p>	<ul style="list-style-type: none"> • Forwarding components for disposal, storage or testing and may include some additional preparation such as packaging

LMTTF2008A Use adhesives

Modification History

Not applicable.

Unit Descriptor

Unit descriptor This unit covers the skills and knowledge required to select and safely use adhesives on canvas and sail products.

Application of the Unit

Application of the Unit This unit applies to the bonding of materials with adhesives on canvas and sail products. Work may be conducted in a variety of environments, such as:

- operational indoor workplaces
- operational outdoor workplaces
- hazardous or exposed conditions

Work may be conducted in small to large scale enterprises and may involve individual and team activities. Work is performed within defined procedures under direct supervision.

The application of this unit is according to OHS practices of the enterprise and workplace practices, which may include:

- requirements prescribed by legislation, awards, agreements and conditions of employment
- standard operating procedures
- work instructions
- oral, written and visual communication
- quality practices, including responsibility for maintenance of own work quality and contribution to quality improvement of team or section output
- housekeeping
- tasks related to environmental protection, waste disposal, pollution control and recycling

This unit requires the application of skills associated with planning and organising for the safe and effective use of adhesives and textile fabrication technology. This unit also requires communication skills

to read and apply workplace information and complete work records. Self management skills are applied to ensure workplace and quality standards are achieved.

Prerequisites

Employability Skills Information

Employability Skills This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Not applicable.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare work area	1.1 Safe working environment is established 1.2 Suitable electrical power outlets are identified, if required 1.3 Work is sequenced to maximise safety and productivity 1.4 Workplace procedures and instructions are read and interpreted
2 Select, use and store tools	2.1 Appropriate hand tools, power tools and electrical equipment are obtained for the work to be performed 2.2 Tools are examined for damage, missing components or other defects (including frayed power cords where applicable) 2.3 Extension power cables are checked for knots and insulation damage 2.4 Electrical tools are connected safely to power supply 2.5 Safety equipment is used during tool operation in accordance with OHS practices

ELEMENT	PERFORMANCE CRITERIA
3 Select adhesives and prepare for their use	2.6 Tasks are performed using tools in accordance with safe working practices 2.7 Tools are located in a safe position when not in use 2.8 Tools and extension cords are cleaned and stored in accordance with industry and enterprise safe working practices 3.1 Nature of materials to be joined is ascertained 3.2 Specified adhesives are obtained 3.3 Appropriate tools and materials are selected for preparation of work piece surfaces and application of adhesive 3.4 Adhesive manufacturer's OHS requirements are checked and prescribed precautions taken before adhesives are used 3.5 Adhesive is prepared to manufacturer's instructions
4 Apply adhesive and bond materials	4.1 Work piece surfaces are prepared for application of adhesive 4.2 Work piece surfaces to be bonded are anchored or otherwise stabilised 4.3 Adhesive is applied in accordance with recommended practice and surfaces are joined 4.4 Joins are allowed to cure for specified time 4.5 Where appropriate, heat to assist in curing the joins is applied to the work piece in accordance with OHS practices 4.6 Knowledge of using adhesives are applied to perform required tasks
5 Inspect and rectify	5.1 Work piece is removed and joins are informally inspected and tested for strength 5.2 Results of informal inspection are verified by supervisor and appropriate action is taken regarding rework or rectification, if necessary
6 Clean up and documentation	6.1 Product is prepared for inspection 6.2 Work area is cleaned and tools and equipment are cleaned and stored in accordance with OHS practices 6.3 Remaining adhesive is safely disposed of or stored in a safe, secure location 6.4 Work records are completed in accordance with workplace requirements

Required Skills and Knowledge

This describes the essential skills and knowledge and their level required for this unit.

Demonstrates knowledge of:

- health, fire and explosion hazards associated with the use of volatile or toxic adhesives and solvents, and specific OHS requirements regarding their use, safe handling and storage
- the range of canvas products in common use
- bonding principles and techniques
- commonly used glues, adhesives and solvents
- curing characteristics of commonly used adhesives and the effects of atmospheric conditions
- quality standards for bonding processes
- safety and environmental requirements of relevant industry and enterprise procedures
- general housekeeping policies and procedures
- OHS practices, including hazard identification and control measures
- quality practices
- workplace practices
- recording and reporting practices

Demonstrates skills to:

- locate and interpret technical information about canvas products, adhesives and equipment used in bonding processes
- use relevant hand and power tools
- use relevant chemicals and cleaning agents and dispose of waste products
- maintain work area
- read, interpret and follow information on work specifications, standard operating procedures and work instructions and other reference material
- maintain accurate records
- communicate within the workplace
- sequence operations
- meet specifications
- clarify and check task-related information
- carry out work according to OHS practices

Evidence Guide

The Evidence Guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for the Training Package.

Critical aspects of evidence to be considered

Demonstrates skills and knowledge to:

- comply with all relevant safety requirements including safe use of adhesives, solvents, hand tools and electrical equipment
- follow work orders
- understand equipment and materials instructions applicable to the use of adhesives
- prepare product to be bonded and set up adhesive application equipment
- perform bonding process
- perform normal operator maintenance of work area to enable work to be conducted safely and efficiently
- document and communicate work related information including reporting of faults and other problems

Consistently applies skills and knowledge when:

- organising work
- completing tasks
- identifying improvements
- using workplace practices
- using OHS practices
- recording and reporting accidents and incidents
- assessing operational readiness of equipment used and work processes
- recognising and adapting to cultural differences in the workplace, including modes of behaviour and interactions
- completing work systematically with attention to detail without damage to goods and equipment

Context and specific resources for assessment

Assessment may occur on the job or in an appropriately simulated environment and requires access to work areas, materials and equipment, and to information on workplace practices and OHS practices.

Guidance information for assessment

This unit may be assessed independently or in combination with other relevant units.

Range Statement

RANGE STATEMENT

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the Performance Criteria, is detailed below. Add any essential operating conditions that may be present with training and assessment depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts.

Legislative/regulatory requirements All work must comply with relevant Federal and State or Territory legislative or regulatory requirements.

Power tools may include

- spray guns
- portable ventilation fans
- hot air dryers
- heat lamps

OHS practices OHS practices must include hazard identification and control, risk assessment and implementation of risk reduction measures specific to the tasks described by this unit, and may include:

- manual handling techniques
- standard operating procedures
- personal protective equipment
- safe materials handling
- taking of rest breaks
- ergonomic arrangement of workplaces
- following marked walkways
- safe storage of equipment
- housekeeping
- reporting accidents and incidents
- other OHS practices relevant to the job and enterprise

Unit Sector(s)

Sector Textile Fabrication

MEA101 Interpret work health and safety practices in aviation maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency covers the skills and knowledge required to comply with work health and safety (WHS) regulations and work safely in aircraft maintenance areas. It requires application of WHS practices relevant to aviation maintenance workplaces in order to ensure own safety and that of others in the workplace.

Workplaces include the flight line or tarmac, hangars and workshops. Maintenance activities include all scheduled and unscheduled maintenance on fixed or rotary wing aircraft and on the components thereof. Work may be performed individually or as part of a team.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|------------------------|---|
| 1. Interpret safe work | 1.1 Relevant regulatory and enterprise policies and procedures that identify the requirements for conduct |
|------------------------|---|

practices		of safe work are interpreted and understood
	1.2	Workplace housekeeping measures are identified in accordance with standard enterprise procedures
	1.3	Use of personal protective equipment (PPE) is identified and understood and maintenance measures are interpreted and understood according to regulatory and enterprise procedures
	1.4	Safety signs and symbols are interpreted and understood, and their directions observed in accordance with enterprise and safety requirements
2.	Interpret reporting procedures for workplace hazards	2.1 Workplace hazards are correctly identified and reporting procedures interpreted and understood according to standard enterprise procedures
3.	Interpret emergency procedures	3.1 Method of contacting the appropriate personnel and emergency services in the event of an accident is appropriate to enterprise requirements
		3.2 Emergency and evacuation procedures are interpreted and understood to ensure safe conduct of personnel according to enterprise procedures
		3.3 Use of emergency equipment is correctly identified to comply with regulatory or enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Requirements for conduct of safe work include:**
- Applying general duty of care under WHS legislation and common law
 - Fluid and gas high and low pressure systems, including fluid handling (for example, hydraulic fluids, lubricants, compressed air, nitrogen and oxygen)

- Fuelling/defuelling and working on fuel systems
 - Using and handling chemicals, including solvents and battery acids
 - Electrical systems, outlets and leads
 - Noise hazard areas and aircraft safety zones
 - Aircraft handling, towing, jacking, ground equipment operation and signage
 - Personal protection
 - Housekeeping and cleaning, waste disposal and foreign object damage (FOD) prevention practices and procedures
 - Confined space entry (where applicable to the enterprise)
 - Aircraft strobe lighting (where applicable to the enterprise)
 - Ionising and non-ionising radiation equipment (where applicable to the enterprise)
 - Commonwealth, State and Territory WHS Acts, regulations and codes of practice, including regulations and codes of practice relating to hazards present in the workplace or industry
 - Organisational safety manuals that specify provisions relating to roles and responsibilities of health and safety representatives and/or WHS committees and provisions relating to WHS issue resolution
 - Maintenance organisation manuals
 - Procedures manuals
 - Work instructions
 - Relevant Defence instructions
 - Civil Aviation Safety Regulations (CASRs)
 - Material safety data sheets (MSDS)
 - Safety manuals
 - Procedures manuals
 - Maintenance manuals
 - Work instructions
 - Relevant Defence instructions
 - Checking equipment or the work area before work commences and during work
 - Workplace inspections
 - Housekeeping
- Relevant regulatory and enterprise policies and procedures are found in:**
- Personal protective equipment (PPE) requirements are found in:**
- Workplace hazard identification includes:**

Unit Mapping Information

Release 1 – supersedes and is equivalent to MEA101B Interpret occupational health and safety practices in aviation maintenance

Links

Companion Volume implementation guides are found in VETNet -

<https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA101 Interpret work health and safety practices in aviation maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- correctly interpreting WHS regulations, instructions and procedures relevant to the requirements for conduct of safe work listed in the Range of Conditions
- recognising and adhering to aerospace industry signage, including aircraft systems plumbing markings
- recognising and reporting to designated personnel hazardous situations in the workplace
- risk assessment and control
- selecting appropriate PPE for the maintenance activity being undertaken
- correct interpretation of enterprise and regulatory emergency procedures
- correct identification and operation of enterprise/industry-specific workplace emergency equipment.

This unit must be related in its assessment and application to all other units. The relationship between general workplace WHS requirements, as included in enterprise procedures, and the relevant federal and/or state and territory legislation must be clearly linked.

Evidence of knowledge and skills associated with the application of WHS standards is required to supplement evidence of ability to interpret and apply specific safe practices in the workplace.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the applicable sources of WHS requirements and procedures and their application in requirements for conduct of safe work as listed in the Range of Conditions
- how to recognise and report hazardous situations in the workplace
- methods of risk assessment and control
- the preferred order of ways to control risks (known as the hierarchy of control)
- work operations to control risks, e.g. permit to work systems, such as confined space entry and isolation procedures
- how to determine requirements for PPE associated with maintenance activities

- the correct selection and use of workplace emergency equipment
- action to be taken in emergency situations.
-

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. Should a demonstration of skill application be necessary, the candidate must have access to all necessary tools, equipment, materials and relevant documentation. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency under routine supervision on at least one item from each of:
 - applying general duty of care under WHS legislation and common law
 - fluid and gas high and low pressure systems, including fluid handling (for example, hydraulic fluids, lubricants, compressed air, nitrogen and oxygen)
 - fuelling/defuelling and working on fuel systems
 - using and handling chemicals, including solvents and battery acids
 - electrical systems, outlets and leads
 - noise hazard areas and aircraft safety zones
 - aircraft handling, towing, jacking, ground equipment operation and signage
 - personal protection
 - housekeeping and cleaning, waste disposal and FOD prevention practices and procedures.
- Also, where applicable to the enterprise, the following:
 - confined space entry
 - aircraft strobe lighting
 - ionising, non-ionising radiation equipment
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide. The relationship between general workplace WHS requirements, as included in enterprise procedures, and the relevant federal and/or state and territory legislation must be clearly linked.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA103 Plan and organise aviation maintenance work activities

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires the application of work planning and organising principles that are applied within the framework of defined single or multiple aviation maintenance tasks that involve one or more individuals. Tasks may be performed during scheduled or unscheduled maintenance performed on flight line/tarmac, in hangars and in component workshops. It is applicable to all Aeroskills maintenance training pathways and is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA) during scheduled or unscheduled maintenance.

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA105	Apply quality standards applicable to aviation maintenance practices
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|-----------------------------|-----|---|
| 1. | Identify task requirements | 1.1 | Task requirements are determined or confirmed, and clarified to ensure correct interpretation of specifications or requirements |
| 2. | Plan steps to complete task | 2.1 | Task is interpreted and relevant steps are identified to ensure efficient conduct of work to meet specifications in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices |
| | | 2.2 | Steps are planned in conjunction with the work of other personnel to allow achievement of practical outcomes in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices |
| | | 2.3 | Human factors are allowed for in planning of steps |
| 3. | Organise work | 3.1 | Work activity is organised with other involved personnel, allowing for relevant human factors and using relevant communication processes to ensure safe and appropriate sequencing of tasks, including observance of all relevant work health and safety (WHS) requirements and the use of material safety data sheets (MSDS) |
| | | 3.2 | All necessary documentation related to job planning and progress is completed and recorded in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Unit Mapping Information

Release 1 – equivalent to MEA103B Plan and organise aviation maintenance work activities

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA103 Plan and organise aviation maintenance work activities

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- the interpretation of information relating to the work activity from a range of industry manuals, industry and enterprise regulations and industry documentation
- consideration of WHS regulations/precautions specific to the work activity and others working in the vicinity of the planned work activity, particularly with regard to electricity, gases (especially oxygen), oils and chemicals
- the use of MSDS
- the application of human factors in planning maintenance activities.

The relationship between broader planning and organising requirements and service specific procedures must be clearly linked.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the impact of human factors on the safe and effective performance of maintenance on aircraft and aircraft components
- MSDS
- the types of servicings performed on aircraft, i.e. scheduled and unscheduled maintenance activities, and their impact on planning aviation work activity
- aircraft reference numbering systems as an aid to organising effective work activity in terms of related tasks and inspection/servicing zones.

Assessment Conditions

- Competency should be assessed in the work environment or by use of simulated activities, covering planning and organising situations applicable in the aircraft maintenance environment.
- This unit must be related in its assessment and application to all other units, particularly those that apply to the actual maintenance of aircraft.

- Evidence of underlying knowledge and skills associated with the general application of planning and organising while allowing for relevant human factors and WHS requirements is required to supplement evidence of ability to integrate these processes in conjunction with other personnel in the workplace.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on single and multiple tasks involving more than one person. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Implementation Guide).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA105 Apply quality standards applicable to aviation maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of quality standards in the performance of aviation maintenance activities, including flight line/tarmac, hangar and workshop maintenance tasks, either individually or as a member of a team during scheduled or unscheduled maintenance.

The unit is applicable to all Aeroskills Maintenance training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA107	Interpret and use aviation maintenance industry manuals and specifications

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|----------------------------------|---|
| 1. Interpret quality standards | 1.1 Standards or specifications set out in maintenance documents and process specifications are identified and interpreted |
| | 1.2 Enterprise quality requirements are identified and confirmed |
| 2. Apply quality standards | 2.1 Standards are applied appropriately for individual and team-related activities |
| | 2.2 Defects within the quality system are detected and reported in accordance with standard procedures, including workplace hazards |
| | 2.3 Documentation is handled and completed accurately and clearly to enable information to be easily read or interpreted |
| 3. Interpret quality improvement | 3.1 Performance monitoring measures are identified to ensure product or service standards are maintained or improved |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Unit Mapping Information

Release 1 – equivalent to MEA105C Apply quality standards applicable to aviation maintenance processes

Links

Assessment Requirements for MEA105 Apply quality standards applicable to aviation maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- the application of workplace hazard reporting and identification procedures
- interpretation and application of information from a range of industry manuals, in particular, amendment status block information, amendment procedures, specification/modification leaflet applicability and changes to drawings
- the correct identification of aircraft hardware, materials and components by marking, part number, size and shape
- being able to differentiate the elements which constitute the system and be able to identify processes, workplace regulations and ISO 9000 compliant documentation and specifications within the workplace environment.

The relationship between broader quality standards requirements and service-specific procedures must be clearly linked. It is essential that actual and potential defects within the quality system are considered, together with ongoing abnormalities of equipment or systems as they affect the quality system.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- typical quality systems and their operation in the workplace
- workplace quality documentation, such as quality manuals, procedures manuals, work instructions and worksheets
- the relationship between the quality system and work health and safety (WHS) requirements, such as workplace hazard reporting
- the relationship between the quality system and identification systems for aircraft hardware, materials and components
- the role of inspection in maintaining aircraft continuing airworthiness and reliability, including ageing aircraft inspection requirements
- how inspection programs are derived and developed
- individual and organisational responsibility associated with 'on condition' maintenance
- inspection terminology and standards of inspection with regard to the quality system

- identifying potential areas for inspection process improvement as a quality system activity.

Assessment Conditions

- Competency should be assessed in the work environment or by use of simulated activities, covering the application of quality standards in situations within the aircraft maintenance environment.
- Evidence of underlying knowledge and skills associated with the general application of quality standards is required to supplement evidence of ability to integrate these processes in conjunction with other personnel in the workplace.
- This unit must be related in its assessment and application to all other units.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision in both single and multiple tasks involving more than one person. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA107 Interpret and use aviation maintenance industry manuals and specifications

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge required for on-aircraft and workshop related activities and is applicable to all Aeroskills training pathways. It covers the competencies required to use and correctly interpret industry manuals, specifications and drawings used in the maintenance and manufacture of aircraft and aircraft components during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Identify and access industry manuals, specifications and drawings | 1.1 Appropriate manuals are identified and accessed for the type of aircraft or component to be maintained |
| | 1.2 Amendment status is clearly established to ensure the |

			correct specifications and procedures are applied
2.	Interpret information	2.1	Relevant chapter or section of manual or drawing is located in relation to the work to be carried out
		2.2	Information is interpreted and procedures to be followed are accurately determined
3.	Apply information	3.1	Work steps are correctly identified in accordance with manual or specification procedures
		3.2	All correct sequencing and adjustments are interpreted in accordance with information contained in industry manuals or specifications
4.	Amend manuals, specifications or drawings	4.1	Manual, specification or drawing changes and/or amendments are incorporated and documented correctly in accordance with statutory regulations and/or enterprise procedures
5.	Store manuals, specifications or drawings	5.1	Manuals, specifications or drawings are stored appropriately to ensure prevention of damage, ready access and updating of information, when required, in accordance with regulatory and/or enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Appropriate manuals include:**
- Aircraft publications, maintenance instruction manuals, process specifications, servicing or service bulletins or structural repair manuals
 - Tooling or equipment manuals, manufacturer's manuals, standard practices, enterprise aviation regulations and publications
 - Illustrated parts catalogues, aircraft wiring manuals or drawings

- Statutory regulations and/or enterprise procedures include:**
- Civil Aviation Regulations (CARs) or Civil Aviation Safety Regulations (CASRs)
 - Applicable Defence Regulations and instructions
 - Maintenance organisation manuals
 - Standing instructions

Assessment Requirements for MEA107 Interpret and use aviation maintenance industry manuals and specifications

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- accessing and interpreting information from industry manuals, including paper-based, microfiche or computer-based media, relating to work activities, including determination of manual amendment status, knowledge of manual structures and locating relevant information/instructions for work activity
- amending industry manuals to reflect current/approved amendment status
- identifying and interpreting information from drawings and diagrams in aircraft maintenance manuals, including component scaling, section, assembly, location, drawing applicability and amendment status from the title block
- correct handling and storage of drawings, manuals and industry media, i.e. microfiche and digital formats
- calculating allowable dimension variations on a component from information in drawing title blocks and drawings
- calculating dimensions from drawings for the purpose of manufacturing aircraft components and hardware.

The transferability of general manual interpretation and use in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices must be clearly established.

Evidence of underlying knowledge and skills associated with the interpretation and use of manuals is required to supplement understanding of the structure and regulatory requirements associated with the aircraft maintenance environment in this area.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the types of industry manuals used in aviation maintenance and types of media
- requirements for custody and upkeep of industry manuals
- techniques for obtaining and applying data contained in industry manuals.

Assessment Conditions

- Competency should be assessed in the work environment, or by use of simulated activities, covering the interpretation and use of enterprise aviation manuals, aircraft publications, process sheets, specifications and drawings applicable to the aircraft maintenance environment.
- This unit must be linked in its assessment and application to those that apply to the actual maintenance of aircraft.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one manual from each of the following groups of publications:
 - aircraft publications, maintenance instruction manuals, process specifications, servicing or service bulletins or structural repair manuals
 - tooling or equipment manuals, manufacturer's manuals, standard practices, enterprise aviation regulations and publications
 - illustrated parts catalogues, aircraft wiring manuals or drawings.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Implementation Guide).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

ME A108 Complete aviation maintenance industry documentation

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to the requirements for the completion and processing of documentation during, and on completion of, aviation maintenance activities and is applicable to all Aeroskills training pathways during scheduled or unscheduled maintenance.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

ME A105 Apply quality standards applicable to aviation maintenance processes

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Interpret documentation

1.1 Documentation requirements are determined and accessed, where necessary, from relevant sources in accordance with regulatory and enterprise procedures

- | | | |
|----|------------------------------------|---|
| | 1.2 | Information contained in existing documentation is interpreted correctly and, where necessary, requirements carried out in accordance with regulatory and enterprise procedures |
| 2. | Complete documentation | 2.1 Information requirements for new documentation or updating of existing documentation are determined to allow for accurate completion of records |
| | 2.2 | Documentation is completed accurately and clearly to enable information to be easily read or interpreted |
| 3. | Store and distribute documentation | 3.1 All procedures for storing and distributing documentation are followed to ensure ready access when required in accordance with regulatory and enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Documentation includes:**
- Maintenance logs, overhaul test/check sheets, job history sheets, traveller cards, maintenance reports, irregularity reports, serviceable tags or removal tags
 - Material safety data sheets (MSDS) or material record sheets

- Regulatory and enterprise procedures are found in:**
- Civil Aviation Regulations (CARs) or Civil Aviation Safety Regulations (CASRs)
 - Maintenance organisation manuals
 - Procedures manuals
 - Work instructions
 - Quality manuals
 - Safety manuals
 - Applicable Defence Regulations and instructions
 - Standing instructions

Unit Mapping Information

Release 1 – equivalent to MEA108B Complete aviation maintenance industry documentation

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA108 Complete aviation maintenance industry documentation

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- identification and accurate completion of industry documentation associated with aircraft/aircraft component maintenance, repair, overhaul and modification activities and industry regulatory reports
- handling industry documentation appropriately to ensure that records are accurately processed, forwarded and/or stored as required by industry and enterprise regulations.

It is essential that information generated in the process of completing paperwork is in a form which is acceptable to the workplace environment and regulatory requirements in accordance with the relevant aircraft publications/maintenance regulations/orders and standards and practices.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- maintenance practice terminology and the associated relationship with industry documentation, i.e. scheduled and unscheduled servicing, aircraft/component lifing, i.e. on condition, life expired, throwaway, repair and overhaul.

Assessment Conditions

- Competency should be assessed in the work environment, or by use of simulated activities, covering the interpretation, use and completion of aircraft maintenance documentation in the maintenance environment in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices.
- This unit must be linked in its assessment and application to those that apply to the actual maintenance of aircraft.
- Evidence of underlying knowledge and skills associated with the interpretation and completion of paperwork is required to supplement evidence of appropriate levels of literacy and numeracy, associated with presenting clear and concise information.

- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one type of documentation from each of the following groups:
 - maintenance logs, overhaul test/check sheets, job history sheets, traveller cards, maintenance reports, irregularity reports, serviceable tags or removal tags
 - MSDS or material record sheets.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Implementation Guide).

MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency is applicable to all Aeroskills maintenance training pathways. It requires application of basic hand skills and standard trade practices in the maintenance of aircraft and aircraft components.

The competency applies to the selection and use of hand and power tools and equipment associated with scheduled and unscheduled on-aircraft or workshop-related activities in the aircraft maintenance environment that involve:

- laying out and fabricating simple items from common aircraft materials
- assembling items using a representative range of common types of aircraft attachment hardware for which relevant fits and clearances, appropriate safety locking devices and fasteners, including lockwire, are correctly selected and applied
- assembling/connecting a range of common aircraft connectors and plumbing, applying safety locking devices, where applicable
- assembling/connecting aircraft control cables and applying safety locking devices, where applicable
- the use of lubrication equipment and lubricants.

Work may be performed individually or as part of a team and in accordance with industry standard procedures specified by manufacturers, regulatory authorities or the enterprise.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA105 Apply quality standards applicable to aviation maintenance

processes

MEA108 Complete aviation maintenance industry documentation

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----------------------------------|---|
| 1. Assess task requirements | 1.1 Available information from relevant documentation and/or other sources, including communication with other personnel, is interpreted and assessed to determine the task and tooling requirements |
| 2. Select tools and/or equipment | 2.1 Hand and/or power tools or equipment, including lubrication equipment and lubricants, are selected for appropriate application to the required task
2.2 All tools and/or equipment to be used are checked for condition or calibration, where necessary
2.3 Unsafe or faulty tools or equipment are identified and marked for repair according to enterprise procedures |
| 3. Use tools and/or equipment | 3.1 Tools and/or equipment are used according to standard practices to ensure the correct outcome is produced
3.2 Tools and/or equipment use is carried out without damage to components or tooling in a safe and efficient manner
3.3 Operational maintenance of tools or equipment is undertaken according to standard workshop procedures |
| 4. Store tools and/or equipment | 4.1 Tools and/or equipment are stored safely and securely in accordance with enterprise procedures |
| 5. Apply standard trade practices | 5.1 Simple items are manufactured using basic engineering hand skills |

- 5.2 Common types of aircraft attachment hardware are correctly selected and used
- 5.3 Common types of safety locking devices and fasteners are correctly selected and used
- 5.4 Aircraft components, devices and hardware are lockwired in the correct manner, using the appropriate wire gauge
- 5.5 Common types of aircraft connectors and plumbing are accurately assembled or connected

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

The use of tools and equipment includes:

- The related manipulative skills required to perform aircraft maintenance in areas where access is extremely limited

Unit Mapping Information

Assessment Requirements for MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- the correct identification, inspection of, application, use and storage of general and purpose specific hand tools (i.e. spanners, screwdrivers, pliers, hammers, cutting devices, files, punches, drills and marking out tools) that may be found in an aircraft engineering workshop or hangar
- the correct identification, inspection of (including calibration), application, use and storage of precision measuring tools (i.e. micrometers, vernier instruments, feeler gauges, go/no-go gauges) that may be found in an aircraft engineering workshop or hangar. Reading instrument scales must be clearly demonstrated during application of instruments to ensure compliance with specifications
- the correct identification, inspection of, application, operation and storage/servicing of portable and fixed power and machine tools (i.e. drills, presses, grinders, shears, pan breaks) that may be found in an aircraft engineering workshop or hangar
- identification, inspection and use of lubrication equipment
- determination of correct lubricants for specified applications
- identification of common ferrous and non-ferrous aircraft materials
- identification of common aircraft composite and non-metallic materials (other than wood)
- identification of aircraft hardware by markings, part numbers, size, shape and material
- the installation of aircraft hardware using standard practices/techniques to ensure safe security and includes:
 - minimum thread engagement
 - split pinning
 - lockwiring
 - application of locking compounds
 - locking tabs, spring washers
 - lock nuts
- the installation of aircraft hardware using tightening, torquing and tensioning techniques. Calculating setting, reading scales and setting up of torque wrench and/or tensioning devices must be clearly demonstrated before application of wrench or device
- identification of various types of aircraft rigid and flexible plumbing and their connectors

- identification of aircraft control cables and related cable system hardware
- manufacture of simple items using basic hand skills.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- types of standard aircraft hardware and methods of identification, including bolts, nuts, washers, pins (cotter, tapered) and fasteners (rivets and camlocs)
- materials from which hardware is manufactured and its applications, including plain, corrosion resistant and temperature/heat resistant
- types of safety locking devices and their application
- common ferrous and non-ferrous aircraft materials, heat treatment and testing
- characteristics and properties of common composite and non-metallic materials other than wood
- types of aircraft cable, turnbuckles, end fittings, tensiometers, pulleys and cable system components, and aircraft flexible control systems
- types and characteristics of lubricants
- types and uses of lubrication equipment
- fits and clearances
- laying out of simple items for manufacture using basic hand skills
- hand and power tool storage and maintenance requirements
- tool calibration requirements
- WHS requirements relevant to the use of hand and power tools.

Assessment Conditions

- Competency should be assessed in the work environment, or by use of simulated activities, using tools and equipment specified by aircraft manuals as well as general purpose tools and test equipment found in most routine situations.
- This unit must be linked in its assessment and application to those units that apply to actual maintenance of aircraft. It is essential that all WHS requirements are met and understood.
- Evidence of knowledge about how tools and equipment are selected, used and maintained is essential. The ability to manipulate tools and equipment correctly in the performance of tasks is necessary to demonstrate transferability of hand skills across a variety of applications.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on the following tasks:
 - laying out and fabricating simple items from common aircraft materials

- assembling items using a representative range of common types of aircraft attachment hardware for which relevant fits and clearances, appropriate safety locking devices and fasteners, including lockwire, and applicable lubricants are correctly selected and applied
- assembling/connecting a range of common aircraft connectors and plumbing, applying safety locking devices, where applicable
- assembling/connecting aircraft control cables and applying safety locking devices, where applicable.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Implementation Guide).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

Links

Companion Volume implementation guides are found in VETNet -
<https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

MEA111 Perform administrative processes to prepare for certification of civil aircraft maintenance

Modification History

Release 1 - New unit of competency

Application

This is one of the units of competency that must be attained to progress from Aircraft Maintenance Engineer (AME) to the grant of a maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the Part 66 Manual of Standards. It covers the competencies required to correctly interpret and apply Civil Aviation Safety Authority (CASA) airworthiness and certification requirements during aircraft scheduled or unscheduled maintenance.

The skills and knowledge covered by the units of competency at Certificate IV level listed in the MEA Aeroskills Training Package for the qualification leading to the applicable maintenance certification licence sought are prerequisite to the attainment of the elements of competency specified in this unit. This includes full coverage of the CASR Part 66 Avionics or Mechanical Syllabus subjects/topics listed in the Part 66 Manual of Standards.

Applications include all maintenance tasks that require certification by a Licensed Aircraft Maintenance Engineer (LAME).

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Determine the registration status of an aircraft | 1.1 Registration status is determined in accordance with CASR Part 47 |
|---|---|

- | | | |
|----|--|---|
| | 1.2 | The person responsible for airworthiness and maintenance control is identified |
| 2. | Determine eligibility to certify the completion of aircraft maintenance activities | 2.1 Eligibility to certify in terms of licence privileges is established in accordance with CASR Parts 42, 145 and 66 |
| | 2.2 | Eligibility to certify in terms of the Aviation Maintenance Organisation (AMO) Class/Rating is established in accordance with CASR Part 145 and Part 42 Subpart F |
| 3. | Prepare for return of aircraft to service | 3.1 Completion of all scheduled and unscheduled maintenance activities is coordinated in accordance with CASR Parts 42 145, 66 and the approved maintenance program |
| | 3.2 | The requirement for a maintenance test flight is determined |
| | 3.3 | Documentation is prepared for return of aircraft to service in accordance with CASR Part 42 and/or 145 and the approved maintenance program |
| 4. | Compile and process maintenance documentation and reports | 4.1 Maintenance documentation is raised and compiled for certification |
| | 4.2 | Configuration management procedures are applied |
| | 4.3 | Maintenance-related reports are compiled and processed |
| | 4.4 | Technical communication activities, both oral and written, are performed |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Note

Range statements listed below are numbered to facilitate precise specification of the assessment requirements included in the Assessment Conditions

Certification tasks

The competency applies to the certification of aircraft maintenance activities, including:

1. Scheduled maintenance
2. Unscheduled maintenance
3. Configuration changes
4. Modification incorporation
5. Repairs

In performing Tasks 1 to 5, knowledge is to be applied with regard to airworthiness regulatory systems and Australian legislation, and the application of compliance requirements in the performance, recording and certification of maintenance activities, as follows:

6. International and national regulatory bodies and recognition agreements, including bilateral agreements
7. Australian airworthiness regulatory bodies and the legislative framework
8. The basis of airworthiness certification and determination of non-conformity
9. Procedures for release of aircraft to service following maintenance, including the determination of the requirement for a maintenance test flight
10. Procedures for certification of scheduled and unscheduled maintenance activities
11. Procedures for certification of the incorporation of modifications
12. Procedures for certifying the completion of repairs
13. Determining and applying configuration management procedures, including the weighing of aircraft and the determination of the centre of gravity
14. Compiling and processing service difficulty reports
15. Compiling and processing technical investigation reports
16. Compiling and processing condition reports
17. Orally communicating on technical and airworthiness compliance topics
18. Communicating in writing on technical and

airworthiness compliance issues

Unit Mapping Information

Release 1 – equivalent to MEA111C Perform administrative processes to prepare for certification of civil aircraft maintenance

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA111 Perform administrative processes to prepare for certification of civil aircraft maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

It is essential that airworthiness compliance requirements are interpreted and fully applied without error.

Evidence is required of underlying knowledge and skills associated with the application of airworthiness legislation and compliance requirements, along with evidence of appropriate levels of English literacy and oral expression associated with presenting clear and concise information.

Skills must be demonstrated in:

- describing and applying the requirements applicable to the privileges of their authority
- application of Airworthiness Directive (AD) requirements under CASR Part 39
- application of maintainers' responsibilities under CASR Parts 42, 66 and 145
- compliance with CASR Part 45 Subpart D
- application of aviation maintenance personnel licensing requirements under CASR Part 66
- application of requirements related to conduct and issue of maintenance certifications and Certificates of Release to Service for the aircraft or aeronautical product under CASR Parts 42, 66 and 145
- demonstrating a familiarity with requirements related to the tasks and functions they may perform
- demonstration of literacy and oral expression skills required for clear written and oral communication.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- AD requirements under CASR Part 39
- maintainers' responsibilities under CASR Parts 42, 66 and 145
- aircraft registration and markings under CASR Parts 45–47
- aviation maintenance personnel licensing requirements under CASR Part 66
- continuing airworthiness requirements under CASR Part 42
- maintenance organisations requirements under CASR Part 42 Subpart F and Part 145
- design organisations under CASR Part 21 Subpart J
- Maintenance Training Organisations (MTO) under CASR Part 147.

Assessment Conditions

- Competency should be assessed in the work environment under supervision but without intervention for the purpose of Log entries, and/or by use of simulated activities in a CASR Part 147 MTO, covering the interpretation and application of airworthiness control and certification requirements.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision without intervention on a range of tasks fully representative of Groups 1 to 18 in the Range of Conditions. The body of evidence for this unit may be collected and logged during simulated activities at the CASR Part 147 MTO and/or performance during supervised workplace activities, such as Practical Consolidation of Training (PCT) assessments.
- Knowledge must also be demonstrated of the concept of airworthiness that underpins the legislative framework and compliance requirements.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

ME A112 Plan and implement civil aircraft maintenance activities

Modification History

Release 1 - New unit of competency

Application

This unit of competency covers all aviation maintenance activities. It requires application of maintenance planning and management skills to plan, implement, evaluate and report on aviation maintenance activities during scheduled or unscheduled maintenance while complying with all legislative and regulatory requirements. Work may be performed individually or as part of a team.

This is one of the units that must be attained to progress from Aircraft Maintenance Engineer (AME) to the grant of a maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

The skills and knowledge covered by the units of competency at Certificate IV level listed in the MEA Aeroskills Training Package for the qualification leading to the applicable maintenance certification licence sought are prerequisite to the attainment of the elements of competency specified in this unit. This includes full coverage of the CASR Part 66 Avionics or Mechanical Syllabus subjects/topics.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

1. Plan aircraft maintenance activities

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.1 Maintenance requirements are determined from applicable sources

1.2 Maintenance tasks are analysed and prioritised

- 1.3 Resource requirements are identified and allocated to ensure the timely and efficient completion of maintenance tasks
 - 1.4 Maintenance tasks to be performed are recorded in a maintenance schedule in accordance with enterprise policies and procedures
 2. Implement aircraft maintenance activities
 - 2.1 Roles and responsibilities of maintenance personnel are communicated and agreed
 - 2.2 Resources and equipment required to perform maintenance tasks are identified and arranged
 - 2.3 Regular liaison with maintenance personnel is maintained to ensure scheduled/unscheduled tasks are being completed and continuity is maintained
 - 2.4 Management/stakeholders are provided with regular updates on maintenance progress in the form of both written and verbal reports, including notes, worksheets, status reports, briefs and individual directives, as required
 - 2.5 Maintenance activities are monitored to ensure compliance with prescribed instructions, policies, procedures and/or regulatory requirements
 - 2.6 Advice and assistance with maintenance activities is provided, as required
 - 2.7 Maintenance problems are resolved in accordance with the approved maintenance data
 - 2.8 Proposed changes to the maintenance schedule are processed and negotiated with management/stakeholders
 3. Evaluate and report maintenance outcomes
 - 3.1 Final maintenance outcomes are evaluated against the schedule in accordance with enterprise policies and procedures
 - 3.2 Maintenance reports are collated, evaluated and forwarded to appropriate management personnel in accordance with enterprise policies and procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

<p>Maintenance requirements are determined from any or all of:</p>	<ul style="list-style-type: none"> • Maintenance releases • Manufacturers' maintenance manuals and servicing schedules • Computer maintenance data systems • Service bulletins • Modification incorporation instructions • Repair instructions • Feedback from maintenance personnel and aircrew via Technical Logs or approved maintenance documentation • Aircraft Maintenance Organisation (AMO) internal work instructions or directives • Airworthiness Directives (ADs)
<p>Resource requirements include:</p>	<ul style="list-style-type: none"> • Required numbers of personnel and their availability • Personnel qualifications, experience and authorisations
<p>Resources and equipment required to perform maintenance tasks include:</p>	<ul style="list-style-type: none"> • Personnel • Spares • Lubricants • Consumables • Tools • Special equipment • Personal protective equipment (PPE) • Associated equipment including various items of ground support equipment
<p>Prescribed instructions, policies, procedures and/or regulatory requirements include:</p>	<ul style="list-style-type: none"> • Manufacturers' operating and maintenance manuals • CASA-approved enterprise operation manuals • Quality procedures and work instructions • Work health and safety (WHS) policies and instructions, including material safety data sheets (MSDS) • Management directives
<p>Advice and assistance in maintenance activities</p>	<ul style="list-style-type: none"> • Fault diagnosis procedures • Troubleshooting

include:	<ul style="list-style-type: none"> • Damage assessment • Assessment of repair cost effectiveness • Assessment of replacement options • Technical services advice or directives
Maintenance problems include:	<ul style="list-style-type: none"> • Lack of resources • Unanticipated breakdowns or faults • Changes in priorities
Maintenance activities include:	<ul style="list-style-type: none"> • Scheduled maintenance • Unscheduled maintenance • Configuration changes • Modification incorporation • Repair

Unit Mapping Information

Assessment Requirements for MEA112 Plan and implement civil aircraft maintenance activities

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- application of the procedures for the identification of specific maintenance requirements through the review of:
 - maintenance releases
 - manufacturers' maintenance manuals and servicing schedules
 - computer maintenance data systems
 - service bulletins
 - modification incorporation instructions
 - repair instructions
 - feedback from maintenance personnel and aircrew via Technical Logs or approved maintenance documentation
 - AMO internal work instructions or directives
 - ADs
- basic project planning techniques, including planning chart development, timing, prioritising, resourcing, monitoring, performance measurement and evaluation of maintenance tasks
- financial and inventory management as an element of task planning
- the basic function, components, operation and interrelationship of all aircraft systems for the initial rating sought
- problem solving techniques and troubleshooting procedures
- damage assessment philosophies and procedures, particularly with regard to corrosion damage
- cost control during maintenance, including cost effectiveness considerations for different repair types
- philosophies and considerations in repair versus replacement options
- the application of quality management systems in aircraft maintenance
- enterprise and regulatory requirements for undertaking, recording and reporting maintenance activities, including relevant WHS requirements and the use of PPE.

It is essential that maintenance requirements are fully identified and that all applicable aspects of planning and implementation are identified and applied to meet organisational priorities and minimise workplace disruptions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- methods of determining and specifying maintenance requirements (Maintenance Review Board (MRB), Maintenance Standards Group (MSG), Extended Range Twin Engine Operations (EROPS), RVSM, Maintenance Programs, Minimum Equipment List (MEL), reliability, Air Transport Association (ATA) codes)
- the procedures for the identification of specific maintenance requirements through the review of:
 - maintenance releases
 - manufacturers' maintenance manuals and servicing schedules
 - computer maintenance data systems
 - service bulletins
 - modification incorporation instructions
 - repair instructions
 - feedback from maintenance personnel and aircrew via Technical Logs or approved maintenance documentation
 - AMO internal work instructions or directives
 - ADs
 - the regulations governing aircraft maintenance coordination
- basic project planning techniques, including planning chart development, timing, prioritising, resourcing, monitoring, performance measurement and evaluation of maintenance tasks
- financial and inventory management as an element of task planning
- the basic function, components, operation and interrelationship of all aircraft systems for the initial rating sought
- problem solving techniques and troubleshooting procedures
- damage assessment philosophies and procedures, particularly with regard to corrosion damage
- cost control during maintenance, including cost effectiveness considerations for different repair types
- philosophies and considerations in repair versus replacement options
- the application of quality management systems in aircraft maintenance
- enterprise and regulatory requirements for undertaking, recording and reporting maintenance activities, including relevant WHS requirements and the use of PPE.

Assessment Conditions

- Competency should be assessed under supervision without intervention in the work environment, and/or by use of simulated activities in a CASR Part 147 Maintenance Training Organisation (MTO), covering the full range of maintenance planning and implementation. This unit must be linked in its assessment and application to those that apply to the exercise of Aircraft Maintenance Engineer Licence or Aircraft Maintenance Specialist Certificate privileges in the actual maintenance of aircraft.
- Evidence is required of underlying knowledge and skills in the planning and implementation of maintenance activities, and in the associated compliance with airworthiness regulatory requirements.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved on a task representing each of:
 - determining maintenance requirements
 - identifying personnel resource requirements
 - identifying resources and equipment required to perform maintenance tasks
 - providing regular updates on progress of tasks
 - identifying and applying prescribed instructions, policy, procedures and/or regulatory requirements
 - providing advice and assistance in maintenance activities
 - resolving maintenance problems.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA113 Supervise civil aircraft maintenance activities and manage human resources in the workplace

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of supervisory and personnel management skills in the performance of all aviation maintenance activities.

This is one of the units that must be attained to progress from Aircraft Maintenance Engineer (AME) to the grant of a maintenance certification licence. It covers the competencies required to supervise maintenance activities, apply human resource management practices applicable at the supervisor level, and contribute to workplace training and competency assessment during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The skills and knowledge covered by the units of competency at Certificate IV level listed in the MEA Aeroskills Training Package for the qualification leading to the applicable maintenance certification licence sought are prerequisite to the attainment of the elements of competency specified in this unit. This includes full coverage of the Civil Aviation Safety Regulation (CASR) Part 66 Avionics or Mechanical Syllabus subjects/topics.

Pre-requisite Unit

Competency Field

Supervision of aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-------------------------------|--|
| 1. Plan maintenance for teams | 1.1 Maintenance tasks are identified and interpreted from available maintenance data or schedules in accordance with enterprise procedures |
|-------------------------------|--|

- 1.2 Workload is organised in order of priority taking into consideration, where applicable, mandatory and optional maintenance tasks
- 1.3 Timeframes are taken into consideration when prioritising maintenance tasks
- 1.4 Required resources are obtained to facilitate planned maintenance tasks
- 2. Implement maintenance for teams
 - 2.1 Maintenance tasks are allocated to appropriate team members with consideration of individual's experience and qualifications
 - 2.2 Personnel are clearly briefed on their responsibility and function in the team
 - 2.3 Team members are correctly authorised to operate the required items of ground support equipment
 - 2.4 Team members are instructed to observe work health and safety (WHS) requirements and all safety hazards are promptly identified and addressed
- 3. Provide guidance
 - 3.1 Guidance is provided to staff, appropriate to the maintenance task and individual's experience, including the communication of relevant maintenance data and procedures
 - 3.2 Guidance is readily available, in person as appropriate to the maintenance task
 - 3.3 Guidance is provided in determining the cause of difficult faults or faults not covered in maintenance manual fault diagnosis guides
- 4. Monitor maintenance quality
 - 4.1 Activities are checked and personnel are guided to ensure that maintenance is performed in accordance with the applicable documentation, policies and procedures
 - 4.2 Completed work, including stages of maintenance, is inspected for serviceability and prepared for certification on applicable documentation
- 5. Perform human resource management activities at the
 - 5.1 Human factors affecting job performance are identified and responded to
 - 5.2 The possibility of maintenance errors is minimised

supervisor level	5.3	Sound teamwork is maintained through an awareness of contributing factors
	5.4	Sound employment relations are maintained
6. Perform workplace training tasks	6.1	On-job training is delivered through the reinforcement of knowledge and skills gained in off-job training and guiding their application to specific on-job maintenance tasks
	6.2	The Supervisor's Verification portion of the Workplace History Sheets (Section 3) of the Log of Industrial Experience and Achievement is completed
	6.3	Expert witness verification of competency for CASR Part 147 Maintenance Training Organisation (MTO) workplace assessors is provided when required

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Maintenance data or schedules include:

- Maintenance records
- Manufacturers' maintenance manuals and servicing schedules
- Computer maintenance data systems
- Service bulletins
- Airworthiness Directives (ADs)
- Modification incorporation instructions
- Repair instructions
- Observations and feedback from maintenance personnel and aircrew via Technical Log entries
- Aircraft Maintenance Organisation (AMO) internal work instructions or directives

Required resources include:

- Personnel
- Spares
- Lubricants

- Consumables
 - Tools
 - Special equipment
 - Personal protective equipment (PPE)
 - Associated equipment including various items of ground support equipment
 - Considerations regarding resources also include:
 - required numbers of personnel and their availability
 - personnel qualifications, experience and authorisations
 - availability of the listed resources
- Guidance in maintenance activities includes:**
- Fault diagnosis procedures
 - Troubleshooting
 - Damage assessment
 - Assessment of repair cost effectiveness
 - Assessment of replacement options
- Human factors affecting job performance include:**
- Individual health and disability
 - Social psychology
 - Time pressure and workload
 - The physical work environment
- The possibility of maintenance errors is minimised through:**
- Varying the extent of supervision according to the nature of the task and work conditions
 - Allowance for qualification and experience levels within the team
 - Allowance for human error and "Murphy's Law" ('If something can go wrong, it will.')
- Employment relations at supervisor level include:**
- Resolution or referral to management of complaints and difficulties
 - Resolution of conflict within the team
 - Absence of team members from the job
 - Maintenance of discipline in the performance of maintenance tasks
 - Allowance for cultural diversity within the team
 - Knowledge of relevant sections of industrial awards, enterprise agreements, and conditions of employment and service that apply to the particular workplace
- Maintenance activities include:**
- Scheduled maintenance
 - Unscheduled maintenance
 - Configuration changes
 - Modification incorporation
 - Repairs
- Prescribed instructions, policy, procedures and/or**
- Manufacturers' operating and maintenance manuals
 - CASA-approved enterprise operation manuals

- regulatory requirements include:**
- Quality procedures and work instructions
 - WHS policies and instructions, including material safety data sheets (MSDS)
 - Management directives

Unit Mapping Information

Release 1 – equivalent to MEA113C Supervise civil aircraft maintenance activities and manage human resources in the workplace

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA113 Supervise civil aircraft maintenance activities and manage human resources in the workplace

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- planning and implementing team maintenance activities
- application of all relevant WHS procedures
- observing human factors in team maintenance activities
- providing guidance to team members
- human resource management at team level
- using and compiling the Log of Industrial Experience and Achievement, including an understanding of:
 - purpose of the Log
 - its structure and content
 - responsibility for making entries therein
 - responsibility for the certification of entries
- explaining the role of CASR Part 147 MTOs in the training and competency assessment process, and of the role of supervisors in assisting workplace competency assessors.

It is essential that maintenance requirements are fully identified and that all applicable aspects of supervision, supervisor level human resource management and involvement in workplace training and competency assessment are identified and applied.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- applicable Commonwealth, state and territory WHS regulations, and enterprise WHS instructions
- the correct use of applicable items of PPE
- the requirement for Confined Space Entry Permits and related training
- applicable MSDS
- Air Transport Association (ATA) 113 Specification for Maintenance Human Factors Guidelines, and of the following human factor elements:

- general factors, including:
 - weaknesses in task design and support
 - motivation and attitudes, task demands and limitations in performance
 - cooperative work, communication and leadership
 - allocation of resources, workload, work conditions and double standards
- aspects relating to the task, including:
 - physical and mental work
 - features of the task which limit efficiency or safety performance, including constraints such as signing-off and shift changeover; time pressures, information sources, trouble shooting methods, tools and equipment
 - task performance levels: skill-based, rule-based and knowledge-based; and the limitations encountered in each category
 - complex and interrelated aircraft systems
- limitations of individual performance, including:
 - the sources and effects of fatigue, detection and countermeasures
 - vision and lighting
 - hearing and noise
 - memory - short and long term
 - claustrophobia and acrophobia
- the influence of external factors, including:
 - maintainability of aircraft
 - guidance availability
 - social environment
 - physical environment, including the effects of extremes of heat and cold, and countermeasures (e.g. limited periods of exposure); noise and fumes; motion and vibration
- the causes of variability in human performance, including:
 - effects of arousal
 - limitations of perception
 - limitations of memory, and management of these
 - limitations of decision-making
 - limitations of motor-functioning
 - information processing
- factors that degrade performance, including:
 - risk motivation
 - individual differences (e.g. depth of training and experience)
 - health
 - alcohol and drugs
- errors in maintenance tasks, including:
 - omissions, incorrect installation and wrong parts
 - assumptions

- error management by minimisation, capture and tolerance
- human factors within groups, including:
 - the distinction between groups and teams; coordination and synergy
 - types of groups: horizontal (same level of personnel) and vertical (different functions)
 - group characteristics; reducing overall task time; coordination
 - team characteristics; performance exceeds sum of individual performances
 - factors which lead to effective working in groups and teams: interaction, participation, open communication, clear expectations, shared leadership and self-assessment
 - team building
 - communication: the process and feedback
- organisational aspects, including:
 - functions and dysfunctionality
 - double standards: professionalism, procedures and time pressure
 - organisational culture, professional culture and work-group culture; and peer pressure
- violation of regulations, procedures and processes, including:
 - organisational failure: latent failure, error-provoking conditions and unsafe acts
 - organisational learning
 - maintenance error management program
- the National MEA Aeroskills Training Package, including relevant units of competency and qualification training pathways.
-

Assessment Conditions

- Competency should be assessed under supervision, without intervention in the work environment, and/or by use of approved simulated activities in a CASR Part 147 MTO, covering the full range of maintenance supervision, supervisor level human resource management and assistance with workplace training and competency assessment, as provided for in the Range of Conditions. This competency standard must be linked in its assessment and application to those that apply to the exercise of Aircraft Maintenance Engineer Licence, or Aircraft Maintenance Technician privileges in the actual maintenance of aircraft.
- Evidence is required of underlying knowledge and skills in the supervision of maintenance activities, and in the associated compliance with airworthiness regulatory requirements. The ability must be demonstrated to apply supervisor level human resource management processes during supervision activities, deliver workplace training, and to record experience and evidence for competency assessment associated with completion of the Log of Industrial Experience and Achievement.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision, without intervention on a maintenance supervision task that includes application across the Range of Conditions of the following:
 - using maintenance data or schedules
 - identifying required resources
 - providing guidance in maintenance activities
 - allowing for human factors affecting job performance
 - minimising the possibility of maintenance errors
 - applying employment relations at supervisor level
 - delivering on-job training.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

ME A114 Certify aeronautical product maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of legislative and regulatory requirements relating to the certification of all aeronautical product maintenance tasks that require certification following completion of maintenance. It must be attained by individuals working in Civil Aviation Safety Regulation (CASR) Part 42 Subpart F and Part 145 maintenance organisations who are authorised to return items of aeronautical product to service after the completion of maintenance during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The units that are specified by the maintenance organisation for the repair, overhaul or modification of the item of aeronautical product being certified for return to service are also required in order to apply this standard.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

1. Comply with airworthiness regulations

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 The status of aircraft components and component parts is determined
- 1.2 Eligibility to certify the completion of maintenance activities is determined
- 1.3 Item of aeronautical product is released to service
- 1.4 Maintenance documentation required for certification is

raised and compiled

- 1.5 Configuration management (CM) procedures are applied
- 1.6 Maintenance-related reports are compiled and processed
- 1.7 Technical communication activities, both oral and written, are performed

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Maintenance activities include:

- Scheduled maintenance
- Unscheduled maintenance
- Configuration changes
- Modification incorporation
- Repairs

In performing each of the above activities, knowledge is to be applied with regard to airworthiness regulatory systems and Australian legislation, and the application of compliance requirements in the performance, recording and certification of maintenance activities, as follows:

- international and national regulatory bodies and recognition agreements, including bilateral agreements
- Australian airworthiness regulatory bodies and the legislative framework
- the basis of airworthiness certification and determination of non-conformity
- procedures for release of aeronautical product to service following maintenance
- procedures for certification of scheduled and unscheduled maintenance activities
- procedures for certification of the incorporation of modifications

- procedures for certifying the completion of repairs
- determining and applying CM procedures
- compiling and processing service difficulty reports
- compiling and processing technical investigation reports
- compiling and processing condition reports
- orally communicating on technical and airworthiness compliance topics
- communicating in writing on technical and airworthiness compliance issues

Unit Mapping Information

Release 1 – equivalent to MEA114A Certify aeronautical product maintenance

Links

Companion Volume implementation guides are found in VETNet -
<https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA114 Certify aeronautical product maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- describing and applying the requirements applicable to the privileges of their authority
- applying Airworthiness Directive (AD) requirements under CASR Part 39
- applying aviation maintenance personnel licensing requirements under CASR Part 66
- applying requirements related to conduct and certification of maintenance under CASR Part 145 and CASR Part 42 Subpart F
- demonstrating a familiarity with requirements related to the tasks and functions they may perform
- demonstrating literacy and oral expression skills required for clear written and oral communication.

It is essential that airworthiness compliance requirements are interpreted and fully applied without error.

Evidence is required of underlying knowledge and skills associated with the application of airworthiness legislation and compliance requirements, along with evidence of appropriate levels of English literacy and oral expression associated with presenting clear and concise information.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- AD requirements under CASR Part 39
- maintainers' responsibilities under CASR Parts 66, 145 and 42 Subpart F
- aviation maintenance personnel licensing requirements under CASR Part 66
- maintenance organisations requirements under CASR Part 145 and 42 Subpart F
- design organisations under CASR Part 21J and the concept of airworthiness
- Maintenance Training Organisations (MTOs) under CASR Part 147.
-

Assessment Conditions

- Competency should be assessed in the work environment under supervision but without intervention for the purpose of Log entries, and/or by use of simulated activities in a CASR Part 147 MTO, covering the interpretation and application of airworthiness control and certification requirements.
- This unit must be linked in its assessment and application to those that apply to the performance of maintenance on the applicable items of aeronautical product.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision without intervention on a range of tasks fully representative of:
 - scheduled maintenance
 - unscheduled maintenance
 - configuration changes
 - modification incorporation
 - repairs.
- In performing each of the above activities, knowledge is to be applied with regard to airworthiness regulatory systems and Australian legislation, and the application of compliance requirements in the performance, recording and certification of maintenance activities, as follows:
 - international and national regulatory bodies and recognition agreements, including bilateral agreements
 - Australian airworthiness regulatory bodies and the legislative framework
 - the basis of airworthiness certification and determination of non-conformity
 - procedures for release of aeronautical product to service following maintenance
 - procedures for certification of scheduled and unscheduled maintenance activities
 - procedures for certification of the incorporation of modifications
 - procedures for certifying the completion of repairs
 - determining and applying CM procedures
 - compiling and processing service difficulty reports
 - compiling and processing technical investigation reports
 - compiling and processing condition reports
 - orally communicating on technical and airworthiness compliance topics
 - communicating in writing on technical and airworthiness compliance issues.
- The body of evidence for this unit may be collected and logged during simulated activities at the CASR Part 147 MTO and/or performance during supervised workplace activities.
- Knowledge must also be demonstrated of the concept of airworthiness that underpins the legislative framework and compliance requirements.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

ME A115 Plan and implement aeronautical product maintenance activities

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to compliance with airworthiness regulatory requirements in the planning, implementation and evaluation of workshop maintenance activities. Activities may relate to the overhaul, repair and modification of items of aeronautical product.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Plan aeronautical product maintenance activities | 1.1 Maintenance requirements are determined from applicable sources |
| | 1.2 Maintenance tasks are analysed and prioritised |
| | 1.3 Resource requirements are identified and allocated to ensure the timely and efficient completion of maintenance tasks |
| | 1.4 Maintenance tasks to be performed are recorded in accordance with enterprise policy and procedures |

2. Implement aeronautical product maintenance activities
 - 2.1 Roles and responsibilities of maintenance personnel are communicated and agreed
 - 2.2 Resources and equipment required to perform maintenance tasks are identified and arranged
 - 2.3 Regular liaison with maintenance personnel is maintained to ensure that tasks are being completed and continuity is maintained
 - 2.4 Management/stakeholders are provided with regular updates on maintenance progress by way of written or verbal communication, including notes, worksheets, status reports, briefs and individual directives
 - 2.5 Maintenance activities are monitored to ensure compliance with prescribed instructions, policy, procedures and/or regulatory requirements
 - 2.6 Advice and assistance with maintenance activities is provided, as required
 - 2.7 Maintenance problems are resolved in accordance with the applicable maintenance documentation
3. Evaluate and report maintenance outcomes
 - 3.1 Final maintenance outcomes are evaluated against the applicable maintenance documentation in accordance with enterprise policy and procedures
 - 3.2 Maintenance reports are collated, evaluated and forwarded to appropriate management personnel in accordance with regulatory requirements, enterprise policy and procedures
 - 3.3 Required maintenance release documentation is packaged with items of aeronautical product that are being released to service

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect

performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Resource requirements include:

- Required numbers of personnel and their availability
- Personnel qualifications, experience and authorisations
- Spares
- Consumables
- Special equipment including component test stations
- Ground support equipment
- Personal protective equipment (PPE)
- Technical data

Enterprise policy and procedures are specified in:

- Maintenance organisation manuals
- Organisational policy manuals
- Procedures manuals
- Quality manuals
- Safety manuals
- Defence instructions and standards
- Standing instructions

Regulatory requirements are found in:

- Civil Aviation Regulations (CARs) or Civil Aviation Safety Regulations (CASRs)
- AAP 7001.053 Technical Airworthiness Management Manual

Advice and assistance include:

- Fault diagnosis procedures
- Troubleshooting
- Damage assessment
- Assessment of repair cost effectiveness
- Assessment of replacement options

Maintenance problems include:

- Lack of resources
- Unanticipated breakdowns or faults
- Changes in priorities

Unit Mapping Information

Release 1 – equivalent to MEA115A Plan and implement aeronautical product maintenance activities

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA115 Plan and implement aeronautical product maintenance activities

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria on at least one occasion under the specified conditions of assessment.

Evidence must be provided that, while planning, implementing, evaluating and reporting aeronautical product maintenance, the candidate can:

- communicate appropriately in English
- produce written communications in English to the required level
- undertake planning and problem solving
- manage personnel and resources
- apply regulations, policies and procedures, including work health and safety (WHS).
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- basic project planning techniques
- problem solving techniques
- basic function and theory of operation of applicable items of aeronautical product
- troubleshooting procedures, including test station operation
- cost effectiveness considerations for different repair types
- philosophies and considerations in repair versus replacement options
- enterprise and regulatory requirements for undertaking, recording and reporting maintenance activities
- WHS legislation
- equity, fraud and ethics.
-

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, then an appropriate simulation must be used where typical aeronautical product maintenance situations are represented in the simulation scenarios and the elements and performance criteria are fully covered across the range of conditions.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts. A person who demonstrates competency in this unit must be able to plan aeronautical product maintenance, manage a workshop performing the maintenance and evaluate and report appropriately the maintenance outcomes.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA116 Apply work health and safety procedures at supervisor level in aviation maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of work health and safety (WHS) Acts, regulations, codes of practice and enterprise WHS procedures during the supervision of all aviation maintenance activities performed on aircraft and in workshops. It is to be applied in combination with all other units of competency in the Diploma of Aeroskills and the Diploma of Aviation Maintenance Management that relate to the supervision of aviation maintenance activities. It also applies to Certificate IV training pathways that lead to supervisory employment.

The unit is part of all training pathways at Diploma level, and at Certificate IV level where the training pathway leads to the responsibility for maintenance supervision.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Supervision of aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Provide information to the work group about WHS and the | 1.1 Relevant provisions of WHS legislation and codes of practice are accurately and clearly explained to the work group |
|--|---|

- | | | |
|--|-----|--|
| organisation's WHS policies, procedures and programs | 1.2 | Information on the organisation's WHS policies, procedures and programs is provided in a readily accessible manner and is accurately and clearly explained to the work group |
| | 1.3 | Information about identified hazards and the outcomes of risk assessment and risk control procedures is regularly provided and is accurately and clearly explained to the work group |
| 2. Implement and monitor participative arrangements for the management of WHS | 2.1 | Organisational procedures for consultation over WHS issues are implemented and monitored to ensure that all members of the work group have the opportunity to contribute |
| | 2.2 | Issues raised through consultation are dealt with and resolved promptly or referred to the appropriate personnel for resolution in accordance with workplace procedures for issue resolution |
| | 2.3 | The outcomes of consultation over WHS issues are promptly made known to the work group |
| 3. Implement and monitor the organisation's procedures for identifying hazards and assessing risks | 3.1 | Existing and potential hazards in the work areas are identified and reported so that risk assessment and risk control procedures can be applied |
| 4. Implement and monitor the organisation's procedures for dealing with risk | 4.1 | Work procedures to control risks are implemented and adherence to them by the work group is monitored in accordance with workplace procedures |
| | 4.2 | Existing risk control measures are monitored and results reported regularly in accordance with workplace procedures |
| | 4.3 | Inadequacies in existing risk control measures are identified in accordance with the hierarchy of control and reported to designated personnel |
| | 4.4 | Inadequacies in resource allocation for implementation of risk control measures are identified and reported to designated personnel |
| 5. Implement the organisation's procedures for dealing | 5.1 | Workplace procedures for dealing with hazardous events are implemented whenever necessary to ensure that prompt control action is taken |

- | | | |
|--|-----|---|
| with hazardous events | 5.2 | Hazardous events are investigated to identify their cause in accordance with investigation procedures |
| | 5.3 | Control measures to prevent recurrence and minimise risks of hazardous events are implemented based on the hierarchy of control if within scope of responsibilities and competencies or alternatively referred to designated personnel for implementation |
| 6. Implement and monitor the organisation's procedures for providing WHS training | 6.1 | WHS training needs are identified accurately, specifying gaps between WHS competencies required and those held by work group members |
| | 6.2 | Arrangements are made for fulfilling identified WHS training needs in both on and off-the-job training programs in consultation with relevant parties |
| 7. Implement and monitor the organisation's procedures for maintaining WHS records | 7.1 | WHS records for work area are accurately and legibly completed in accordance with workplace requirements for WHS records and legal requirements for the maintenance of records of occupational injury and disease |
| | 7.2 | Aggregate information from the area's WHS records is used to identify hazards and monitor risk control procedures within work area according to organisational procedures and within scope of responsibilities and competencies |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- WHS legislation and codes of practice include:**
- State/Territory/Commonwealth WHS Acts, regulations and codes of practice, including general duty of care under WHS legislation and common law

The organisation's WHS policies, procedures and programs are included in:

- Relevant defence instructions
- Civil Aviation Safety Regulations (CASRs)
- Requirements for the maintenance and confidentiality of records of occupational injury and disease
- Provisions relating to health and safety representatives and/or WHS committees
- Provisions relating to WHS issue resolution
- Safety manuals
- Maintenance organisation manual
- Standing instructions
- Procedures manuals
- Work instructions

Information is provided:

- For the induction of new maintenance personnel
- About the nature of work, tasks and procedures
- To assist in work tasks
- As part of providing direct supervision
- To communicate organisational safety requirements and procedures
- For consultation with health and safety representatives and WHS committees

Consultation over WHS issues includes:

- Formal and informal meetings which include WHS
- WHS committees
- Other committees, such as consultative, planning and purchasing
- Health and safety representatives
- Suggestions, requests, reports and concerns put forward by employees to management

Assessment of existing and potential hazards and risk includes:

- Audits
- Workplace inspections
- Housekeeping
- Checking work area and/or equipment before and during work
- Job and work system assessment
- Reviews of WHS records, including registers of hazardous substances, dangerous goods, and so on
- Maintenance of plant and equipment
- Provision of supplies and equipment, e.g. review of material safety data sheets (MSDS) and manufacturer/supplier information
- Identifying employee concerns

Risk control procedures include:

- Measures to remove the cause of a risk at its source
- Application of the hierarchy of control:
 - elimination of risk

- engineering controls
 - administrative controls
 - personal protective equipment (PPE)
 - Consultation with maintenance personnel and their representatives
- Procedures for dealing with hazardous events include:**
- Evacuation
 - Chemical containment
 - First aid
 - Accident/incident reporting and investigation
- Hazardous events include:**
- Accidents
 - Fires and explosions
 - Emergencies, e.g. fuel or chemical spills
 - Bomb scares
 - Violent incidents
- WHS training includes:**
- Induction training
 - Specific hazard training
 - Specific task or equipment training
 - Emergency and evacuation training
 - Training as part of broader programs, such as equipment operation
- WHS records include:**
- WHS audit and inspection reports
 - Health surveillance and workplace environmental monitoring reports
 - Records of instruction and training
 - Manufacturers and suppliers information, including MSDS and dangerous goods storage lists
 - Hazardous substances registers
 - Maintenance and testing reports
 - Workers compensation and rehabilitation records
 - First aid/medical post records

Unit Mapping Information

Release 1 – equivalent to MEA116B Apply work health and safety procedures at supervisor level in aviation maintenance

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA116 Apply work health and safety procedures at supervisor level in aviation maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion.

Evidence must be provided that the candidate can apply applicable WHS Acts, regulations and codes to:

- analyse the entire work environment in the area of responsibility in order to identify hazards, assess risks and judge when intervention to control risks is necessary
- analyse relevant workplace data, such as incident or environmental monitoring data, to identify hazards, assess risks and evaluate the effectiveness of risk control measures
- assess the resources needed to apply different risk control measures and make recommendations to management on that basis.

The demonstrated ability to apply the elements and performance criteria of this unit of competency in conjunction with other units relating to the supervision of aviation maintenance activities is critical.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the provisions of WHS Acts, regulations and codes of practice relevant to the workplace, including legal responsibilities of employers, employees and other parties with legal responsibilities
- principles and practices of effective WHS management
- hazard identification and control in the workplace
- organisational WHS management systems, policies and procedures that support organisational compliance with legal requirements
- the impact on WHS management of workforce characteristics and composition
- the relevance of WHS management to other organisational systems, policies and procedures.

Assessment Conditions

- This unit may be assessed through a combination of workplace (or a realistic simulation) and off-the-job assessment. The context of assessment should ensure that evidence relating to the contingency management component of competency can be collected. Evidence must include observation in the workplace as well as off-the-job techniques, such as interviews and simulations. Conditions for simulations should accurately simulate the range of circumstances (especially with regard to a realistic range of emergencies and hazardous events) that the individual could be expected to deal with in the workplace and allow for discussion. The individual must be given access to:
 - relevant WHS Acts, regulations and codes of practice
 - enterprise WHS policies and procedures
 - personal protective equipment
 - relevant work areas for identification of hazards and control measures.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors). The assessor should also have recognised expertise in managing WHS in an aviation maintenance environment or work in an assessment team with such a person.

MEA117 Apply self in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to ethical behaviour, effective work performance and skills development relating to all aspects of aircraft and aircraft component maintenance during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of all Certificate II training pathways. It covers the competencies required to work ethically and effectively in the maintenance of aircraft and aircraft components at Certificate II level while contributing to the development of the individual's own capabilities.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|----------------|--|
| 1. Manage self | 1.1 Responsibility for own workload is accepted |
| | 1.2 Work is undertaken individually or as a team member to complete maintenance tasks in a timely manner and in accordance with enterprise procedures and requirements |
| | 1.3 Initiative is exercised in liaison with colleagues in identifying and analysing alternative approaches to resolving workplace issues and problems |

- | | | |
|--|-----|--|
| | 1.4 | Performance feedback from others is used to improve work performance |
| | 1.5 | Organisational structure, career paths and eligibility criteria are identified |
| | 1.6 | Awareness is maintained of the effects of fatigue, drugs and alcohol on performance |
| 2. Work effectively with others | 2.1 | Effective communication skills are applied in oral and written form, including email |
| | 2.2 | Others are dealt with ethically and principles of diversity applied |
| | 2.3 | The trust and confidence of others is developed and maintained at all levels of the organisation |
| 3. Participate in the process of change and innovation | 3.1 | Work is undertaken with others to implement change in the workplace |
| | 3.2 | Opportunities for product and service enhancement are identified and proposed to supervisors |
| 4. Contribute to development of own skills | 4.1 | Units of competency relevant to current employment are identified and applied |
| | 4.2 | Units of competency required for desired career path progression are identified and action is initiated through enterprise procedures to facilitate their attainment |
| | 4.3 | New ideas and techniques are accepted and time and effort invested in learning new skills |
| | 4.4 | Performance feedback is used to identify and develop ways to improve competence |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance.

Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Assessment Requirements for MEA117 Apply self in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion.

Evidence must be provided that the candidate, in relation to performing aviation maintenance, is capable of:

- oral communication in English regarding maintenance issues
- written communication in English, including email, regarding maintenance issues
- applying principles of equity and diversity
- managing own work performance both individually and as part of a team
- interfacing effectively with others in the performance of maintenance and adapting to change
- applying legislation, regulations and organisational policies and procedures relevant to role and workplace
- contributing to own knowledge, skills and competency development for job performance and career progression.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- oral and written communication within the aviation maintenance environment, including email
- human factors relating to fatigue, drugs and alcohol and performance of work as an individual and as a team member
- the application within the workplace of legislative requirements and principles regarding equal opportunity, equity and diversity
- aviation maintenance legislation, regulations and organisational policies and procedures that are relevant to the individual's role and workplace
- MEA Aeroskills Training Package and relevant pathways to qualifications and their application within the enterprise
- problem solving principles
- constant improvement principles and procedures
- enterprise procedures for proposing modifications or changes in work procedures

- change management.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job an appropriate simulation must be used where the range of conditions reflects realistic workplace situations.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements and the performance criteria of the unit, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Evidence of competency attainment shall be obtained via the records in the Log of Industrial Experience and Achievement, or where applicable an equivalent industry evidence guide (refer to the Companion Volume Assessment Guidelines).
- Competency in this unit underpins competency in other aspects of the workplace role of employees at Certificate II level. It may be appropriate to assess parts of this unit in conjunction with units relating to the performance of maintenance activities.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA118 Conduct self in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to ethical behaviour, self-management and skills development relating to all aspects of aircraft and aircraft component maintenance during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of all Certificate III and IV level training pathways. It covers the competencies required to perform work ethically and efficiently in the maintenance of aircraft and aircraft components at Certificate IV level while contributing to the development of the individual's own capabilities.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

1. Manage self

Performance criteria describe the performance needed to demonstrate achievement of the element.

- 1.1 Responsibility for own workload is assessed, prioritised and accepted
- 1.2 Work is undertaken individually or as a team member to complete maintenance tasks in a timely manner and in accordance with enterprise procedures and requirements
- 1.3 Independence and initiative are demonstrated in

- identifying and solving problems
- 1.4 Initiative is exercised in liaison with colleagues in identifying and analysing alternative approaches to resolving workplace issues and problems
 - 1.5 Own skills and knowledge are evaluated and monitored and confidence is built in own capability, ideas and vision
 - 1.6 Performance feedback from others is used to improve work performance
 - 1.7 Organisational structure, career paths and eligibility criteria are identified
 - 1.8 Awareness is maintained of the effects of fatigue, drugs and alcohol on performance
2. Work effectively with others
 - 2.1 Effective communication skills are applied oral and written, including email, forms in English
 - 2.2 Others are dealt with ethically and principles of diversity applied
 - 2.3 The trust and confidence of others is developed and maintained at all levels of the organisation
 - 2.4 Guidance is provided to other team members as required regarding skills application and maintenance processes
 - 2.5 Advantages, disadvantages and consequences of ideas are identified and considered
 3. Participate in the process of change and innovation
 - 3.1 Work is undertaken with others to implement change in the workplace
 - 3.2 Opportunities for product and service enhancement and options for achieving the desired result are identified and proposed in accordance with enterprise procedures
 4. Contribute to development of own skills
 - 4.1 Units of competency relevant to current employment are identified and applied
 - 4.2 Units of competency required for desired career path progression are identified and action is initiated through enterprise procedures to facilitate their attainment
 - 4.3 Problem solving skills are reviewed for further development

- 4.4 Own personal knowledge and skills are assessed and learning opportunities are accessed as required to fill gaps and enhance skills
- 4.5 New ideas and techniques accepted and time and effort invested in learning new skills
- 4.6 Performance feedback is used to identify and develop ways to improve competence

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Assessment Requirements for MEA118 Conduct self in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion.

Evidence must be provided that the candidate, during aviation maintenance activities, is capable of:

- oral communication in English regarding maintenance activities
- written communication in English, including email, regarding maintenance activities
- applying principles of equity and diversity
- managing own work performance both individually and as part of a team
- interfacing effectively with others in the performance of maintenance and adapting to change
- applying legislation, regulations and organisational policies and procedures relevant to role and workplace
- contributing to own knowledge, skills and competency development for job performance and career progression
- provision of guidance to other team members.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- oral and written communication within the aviation maintenance environment, including email
- human factors relating to fatigue, drugs and alcohol and performance of work as an individual and as a team member
- the application within the workplace of legislative requirements and principles regarding equal opportunity, equity and diversity
- aviation maintenance legislation, regulations and organisational policies and procedures that are relevant to the individual's role and workplace
- MEA Aeroskills Training Package and relevant pathways to qualifications and their application within the enterprise
- problem solving principles
- constant improvement principles and procedures

- enterprise procedures for proposing modifications or changes in work procedures
- change management
- methods of providing effective guidance to others in the aviation maintenance environment.
-

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job an appropriate simulation must be used where the range of conditions reflects realistic workplace situations.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements and performance criteria of the unit, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Evidence of competency attainment shall be obtained via the records in the Log of Industrial Experience and Achievement, or where applicable an equivalent industry evidence guide (refer to the Companion Volume Assessment Guidelines).
- Competency in this unit underpins competency in other aspects of the workplace role of employees at Certificate III or IV levels. It may be appropriate to assess parts of this unit in conjunction with units relating to aircraft or component maintenance activities.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA119 Perform administrative processes to prepare for certification of civil aircraft A level line mainten

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of legislative and regulatory requirements relating to the certification of aviation maintenance within the scope of the A Licence by an Aircraft Maintenance Engineer who holds an A Licence.

This is one of the units of competency that must be attained to progress from Aircraft Maintenance Engineer to the grant of an Aircraft Maintenance Engineer A Licence under Civil Aviation Safety Regulation (CASR) Part 66. It covers the competencies required to correctly interpret and apply Civil Aviation Safety Authority (CASA) airworthiness and certification requirements during aircraft line maintenance tasks within the scope of the A Licence privileges during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The skills and knowledge covered by the units of competency listed in the MEA Aeroskills Training Package for the Certificate II in Aircraft Line Maintenance are prerequisite to the attainment of the elements of competency specified in this unit. This includes full coverage of the CASR Part 66 Avionics or Mechanical Syllabus subjects/topics applicable to the A Licence.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Determine eligibility to certify the completion | 1.1 Eligibility to certify line maintenance activities in terms of licence privileges is established in accordance with |
|--|---|

of aircraft maintenance activities	CASR Parts 42, 145 and 66
2. Prepare for return of aircraft to service	2.1 Allocated line maintenance activities are completed in accordance with CASR Parts 42, 145, 66 and the approved maintenance program 2.2 Documentation is prepared for return of aircraft to service in accordance with CASR Part 42 and/or 145 and the approved maintenance program
3. Compile and process maintenance documentation and reports	3.1 Maintenance documentation is raised and compiled for certification 3.2 Configuration management (CM) procedures are applied 3.3 Maintenance related reports are compiled and processed 3.4 Technical communication activities, both oral and written, are performed

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Note

Range statements listed below are numbered to facilitate specification of the assessment requirements included in the Performance Evidence

Certification of aircraft maintenance activities

The competency applies to the certification of aircraft maintenance activities, including:

1. Scheduled line maintenance up to Weekly Check level or equivalent
2. Unscheduled maintenance involving component removal and installation within the scope of the A Licence
3. Configuration changes that are within the scope of the A

Licence

4. Repairs to internal fittings

Regulatory systems, legislation and compliance

In performing Tasks 1 to 4, knowledge is to be applied with regard to airworthiness regulatory systems and Australian legislation, and the application of compliance requirements in the performance, recording and certification of maintenance activities, as follows:

5. International and national regulatory bodies and recognition agreements, including bilateral agreements

6. Australian airworthiness regulatory bodies and the legislative framework

7. Procedures for release of aircraft to service following maintenance

8. Procedures for certification of scheduled and unscheduled maintenance activities

9. Procedures for certifying the completion of repairs

10. Determining and applying configuration management procedures involving items of removable equipment

11. Compiling and processing service difficulty reports

12. Orally communicating on technical and airworthiness compliance topics

13. Communicating in writing on technical and airworthiness compliance issues

Unit Mapping Information

Assessment Requirements for MEA119 Perform administrative processes to prepare for certification of civil aircraft A level line mainten

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- describing and applying the requirements applicable to the privileges of their authority
- application of Airworthiness Directive (AD) requirements under CASR 39
- application of maintainers' responsibilities under CASR Parts 42, 66 and 145
- compliance with CASR 45 Subpart D
- application of aviation maintenance personnel licensing requirements under CASR 66
- application of requirements related to conduct and certification of maintenance under CASR 145
- demonstrating a familiarity with requirements related to the tasks and functions they may perform
- demonstration of literacy and oral expression skills required for clear written and oral communication.

It is essential that airworthiness compliance requirements are interpreted and fully applied without error.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- AD requirements under CASR 39
- continuing airworthiness requirements of CASR Parts 21 and 42
- maintainers' responsibilities under CASR Parts 42, 66 and 145
- aviation maintenance personnel licensing requirements under CASR 66
- maintenance requirements under the applicable CASR Parts
- maintenance organisations requirements under CASR 145
- the concept of airworthiness that underpins the legislative framework and compliance requirements
- air operations requirements, including:
 - air operators' certificates

- operators' responsibilities, in particular regarding continuing airworthiness and maintenance
- aircraft maintenance program
- minimum equipment lists
- documents to be carried on board
- aircraft placarding
- applicable national and international requirements:
 - management programs, maintenance checks and inspections
 - master minimum equipment lists, minimum equipment list, and dispatch deviation lists
 - ADs
 - service bulletins, manufacturer's service information
 - modification and repairs
 - maintenance documentation, including maintenance manuals, structural repair manuals, illustrated parts catalogue.

Assessment Conditions

- Competency should be assessed in the work environment under supervision but without intervention for the purpose of Journal entries, and/or by use of simulated activities in a CASR Part 147 Maintenance Training Organisation (MTO), covering the interpretation and application of airworthiness control and certification requirements.
- This unit must be linked in its assessment and application to those that apply to the exercise of Aircraft Maintenance Engineer A Licence privileges in the actual maintenance of aircraft.
- Evidence is required of underlying knowledge and skills associated with the application of airworthiness legislation and compliance requirements, along with evidence of appropriate levels of English literacy and oral expression associated with presenting clear and concise information.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision without intervention on a range of tasks fully representative of Groups 1 to 13 in the Range of Conditions. The body of evidence for this unit may be collected and logged during simulated activities at the CASR Part 147 MTO and/or performance during supervised workplace activities.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

ME A120 Manage an aviation maintenance quality system

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of quality system concepts and management procedures within an aviation maintenance organisation, including setting up a quality process and the monitoring and evaluation of quality processes within a quality system during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--------------------------------|---|
| 1. Establish a quality process | 1.1 Organisational structure, work processes and outcomes are identified and defined |
| | 1.2 Operating procedures, job descriptions and supporting documentation are developed |
| | 1.3 Quality control processes/checks are established and documented |
| | 1.4 Aviation regulatory instructions/policies are identified and incorporated into quality system processes and documentation |

- | | | |
|----|--|--|
| 2. | Monitor and evaluate quality processes within a quality system | 1.5 Personnel roles and responsibilities are allocated and communicated |
| | | 2.1 Quality control checks are conducted in accordance with organisational policy and procedures |
| | | 2.2 Non-compliances are identified, analysed and appropriate responses initiated in accordance with air safety management guidelines |
| | | 2.3 Outcomes are recorded and reported in accordance with organisational policy and procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Assessment Requirements for MEA120 Manage an aviation maintenance quality system

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion.

Evidence must be provided that the candidate can manage an aviation maintenance quality system that includes:

- leadership
- research and interpretation of regulations and guidelines
- written communication
- oral communication
- inspecting and auditing
- quality management.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- enterprise authorisation and re-authorisation procedures
- organisational policy and procedures
- enterprise and industry regulatory requirements in monitoring and assessing quality in the aviation maintenance environment
- quality system audit and review requirements and processes
- relevant WHS legislation at state/territory and Commonwealth level
- quality management principles.
-

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered during the management of an aviation maintenance quality system.

- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA121 Manage aircraft/aeronautical product configuration

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of configuration management (CM) procedures specified by applicable regulatory bodies and the organisation. It includes management of weight and balance, role equipment, modification state and of spares authenticity and traceability during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Manage aircraft/aeronautical product configuration | 1.1 Aircraft and aeronautical product maintenance configuration is maintained in accordance with applicable maintenance documentation |
| | 1.2 Aircraft configuration is changed and maintained to meet established role requirements in accordance with airworthiness regulations and organisational policy and procedures |
| | 1.3 Modifications to aircraft and aeronautical product are carried out in accordance with airworthiness regulations and organisational policy and procedures |

- 1.4 Aeronautical product is authenticated and checked for serviceability in accordance with airworthiness regulations and organisational policy and procedures
- 1.5 Locally manufactured components are produced to authorised specifications and technical drawings
- 1.6 Aircraft weight and balance is maintained and validated in accordance with regulatory requirements and organisational policy and procedures
- 1.7 Revised weight and balance data is provided for revision of aircraft loading systems
- 2. Manage maintenance records and documentation
 - 2.1 Maintenance reports and documentation are compiled and despatched in accordance with regulatory requirements and organisational policy and procedures
 - 2.2 Maintenance records and associated documentation are maintained in accordance with organisational policy and procedures
 - 2.3 Deficiencies in documentation are remedied in accordance with organisational policy and procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.	
Maintenance configuration	The maintenance configuration is defined by the original drawings, standards and component fit of the aircraft or aeronautical product, and as subsequently varied by approved modifications or approved component/material substitution
Applicable maintenance documentation includes:	<ul style="list-style-type: none"> • Aircraft/equipment maintenance documentation required by applicable regulations and organisational policy and procedures

	<ul style="list-style-type: none"> • Computer maintenance databases
Aircraft configuration	Aircraft configuration covers the equipment fit for approved operation, including specified role equipment
Airworthiness regulations and organisational policy and procedures include:	<ul style="list-style-type: none"> • Civil Aviation Regulations (CARs) and associated Advisory Circulars (ACs) • Civil Aviation Safety Regulation (CASR), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material • AAP 7001.053 Technical Airworthiness Management Manual • Maintenance organisation manuals • Maintenance organisation exposition • Continuing airworthiness management organisation exposition • Maintenance control manuals • Procedures manuals • Work instructions
Evidence of component authenticity includes:	<ul style="list-style-type: none"> • Authorised ADF technical documentation • Original equipment manufacturers documentation • Authorised release certificates • Certificates of conformance • A certifying statement
Maintenance reports and documentation include:	<ul style="list-style-type: none"> • Reports and documents that must be forwarded to CASA as specified by CARs or CASRs • Continuing airworthiness documentation and reports • Computer maintenance database reports • Stores forms • Articles in use accounts • Aircraft/equipment cross-reference records
Maintenance records and associated documentation include:	<ul style="list-style-type: none"> • Aircraft maintenance records • Aeronautical product maintenance records • Completed worksheets

Assessment Requirements for MEA121 Manage aircraft/aeronautical product configuration

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion.

Evidence must be provided that the candidate can:

- manage aircraft and aeronautical product configuration
- audit aircraft and aeronautical product configuration
- document maintenance activities.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- modification documentation and recording
- weight and balance documentation and recording
- role/alternate mission changes and related maintenance actions
- deviations
- approval processes for local manufacture of components
- procedures for determining authenticity of components
- cannibalisation procedures and impact on configuration.
-

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered in the management of aircraft aeronautical product configuration.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.

- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA122 Manage aircraft/equipment system performance testing

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to the use of performance testing in establishing the airworthiness state of aircraft and aircraft systems through means such as aircraft flight testing, engine ground runs, system functional tests and test equipment calibration during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA126 Manage aircraft maintenance activities

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Plan and specify aircraft/equipment systems performance tests

1.1 Aircraft/equipment system performance test requirements are established in accordance with airworthiness regulations, policies and procedures including work health and safety (WHS) requirements associated with engine running and system functional testing

1.2 Aircraft/systems performance tests are programmed in conjunction with appropriate personnel

- 1.3 Aircraft/systems performance test specifications are communicated to appropriate personnel in accordance with organisational policies and procedures
- 1.4 Test equipment calibration is managed in accordance with regulatory requirements and organisational policies and procedures
2. Assess aircraft/equipment systems performance
 - 2.1 Test results are assessed for compliance with test specifications
 - 2.2 Non-compliant test results are identified and diagnosed in consultation with appropriate personnel
 - 2.3 Aircraft/equipment systems are assessed for airworthiness compliance
 - 2.4 Rectification recommendations are produced and reported in accordance with airworthiness policies and procedures
 - 2.5 Test results are documented in accordance with approved guidelines

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Aircraft/equipment system performance tests include:

- Engine ground runs
- Maintenance/validation test flights
- System functional testing

Airworthiness regulations, policies and procedures include:

- Civil Aviation Regulations (CARs) and associated Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- AAP 7001.053 Technical Airworthiness Maintenance

Manual

- Airworthiness Directives (ADs)
- Maintenance management plan
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Procedures manuals
- Work instructions
- Flight test schedules
- Maintenance manuals
- Maintenance test pilots
- Authorised engineering officers
- Authorised airworthiness representatives
- Accountable managers/responsible managers
- Senior maintenance managers
- Continuing airworthiness management personnel
- Authorised maintenance personnel
- Completed test schedules
- Auditable reports

Appropriate personnel include:

Recommendations include:

Assessment Requirements for MEA122 Manage aircraft/equipment system performance testing

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- communicating and consulting
- problem solving
- researching
- report writing
- observing relevant regulatory requirements
- applying work health and safety (WHS) requirements associated with engine ground runs and system functional testing.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- procedures and documentation action for test flights
- procedures and documentation action for engine ground runs
- procedures for functional testing of systems and evaluation of results
- WHS procedures relating to engine ground runs and system functional testing.
-

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered when managing aircraft equipment system performance testing.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.

- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA123 Manage aviation maintenance work environment policy and practices

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of knowledge of relevant regulations and organisational policy and procedures in planning, developing and implementing work practices for use during scheduled or unscheduled maintenance in aviation maintenance workshops, aircraft hangars and on flight lines. Work may be performed individually or as part of a team.

This unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-------------------------------------|---|
| 1. Plan work practices and policies | 1.1 Work practices and policies are planned which emphasise the safety and wellbeing of others and comply with legislation, rules and regulations |
| | 1.2 Guidance from appropriate authorities is sought where necessary |
| | 1.3 Plans are prepared for the implementation of corrective action to remedy identified deficiencies |
| | 1.4 Learning programs are planned to provide personnel |

- with the knowledge and skills required to maintain a safe working environment
2. Control the development and implementation of work practices
 - 2.1 Work practices are developed and implemented within work health and safety (WHS) requirements and industrial agreement provisions
 - 2.2 Employment conditions are interpreted and applied in the work context
 - 2.3 Employees are informed of their obligations and rights under legislation and the organisation's conditions of employment
 - 2.4 Quality standards required by regulations and instructions are maintained in industry/enterprise work practices
 - 2.5 Work practices are adequately communicated to all aviation personnel and performance difficulties are identified
 3. Implement work environment policy and practices
 - 3.1 Responsibility for implementing policies and practices for a clean, safe and healthy work environment is delegated to appropriate personnel in accordance with regulatory requirements and organisational policy and procedures
 - 3.2 Appropriate reporting systems practices are modified to incorporate improvements in maintaining a safe, clean and healthy work environment
 - 3.3 Work practices and procedures are modified on the basis of incident analysis statistics to reduce/eliminate the causative factors
 4. Conduct investigations into injuries and related claim
 - 4.1 Injury reports and associated claims investigations are initiated in the shortest possible time after an incident in accordance with legislative, regulatory and organisational requirements
 - 4.2 Injury and claim statistics are analysed to determine causes and prevent recurrence

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Legislation, rules and regulations include:

- Commonwealth and state/territory WHS legislation
- AAP 7001.053 Technical Airworthiness Management Manual
- Defence instructions and standards
- Standing instructions
- Safety manuals
- Work procedures
- Work instructions
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions

Work practices apply to:

- Plant and machinery
- All personnel present in work areas

Aspects of the work environment include:

- Lighting
- Noise
- Atmospheric contamination
- Physical hazards
- Chemical materials
- Enclosed spaces

Unit Mapping Information

Release 1 – equivalent to MEA123B Manage aviation maintenance work environment policy and practices

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA123 Manage aviation maintenance work environment policy and practices

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- ability to analyse the working environment and develop appropriate work practices
- complying with relevant legislation, rules and regulations
- ability to manage the work environment through delegation of responsibilities to appropriate personnel.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS legislation at Commonwealth and state/territory levels
- enterprise and organisational level WHS policies, rules and procedures
- airworthiness regulations and associated documentation relating to workplaces and work practices.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered during management of aviation maintenance work environment in terms of policy and practice..
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA124 Coordinate change programs in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of management processes that promote and initiate desirable changes that will improve individual and organisational effectiveness in the aviation maintenance environment during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Promote change within workplace practices | 1.1 Change is promoted as an opportunity for improving individual and organisational effectiveness |
| | 1.2 Personnel are encouraged to adopt changes which make improvements in individual and organisational effectiveness |
| | 1.3 Opportunities and threats presented by change are identified and appropriate responses are planned |
| | 1.4 Personnel are involved in designing and implementing |

change within organisational and regulatory guidelines

2. Initiate change where necessary
- 2.1 The proposed initiatives for bringing about improvements are supported within the organisation
 - 2.2 Change for the better is initiated where necessary and is managed in a planned and constructive manner
 - 2.3 Consultative processes are initiated

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Change results from:

- Technology
- Procedures
- Policy
- Government legislation
- Regulations
- Personnel
- Finance
- Ongoing evaluation and feedback

Opportunities include:

- Improved maintenance procedures that decrease maintenance times and/or man-hours
- Improved procedures for the management of maintenance or logistic support activities
- Improvements in physical working conditions
- Adoption of more effective tooling or support equipment
- Improvements to maintenance data

Threats include:

- Adoption of changes that are in violation of regulatory requirements
- Adoption of changes that are in violation of organisational policy or procedures
- Failure to recognise additional training or authorisation requirements

Organisational and regulatory guidelines include:

- Failure to fully comply with relevant work health and safety (WHS) legislation
- Failure to get the full support of all stakeholders, including those in other parts of the overall maintenance and logistic support organisation
- Failure to recognise a need for changes to industrial awards or agreements
- Civil Aviation Regulations (CARs) and associated Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- AAP 7001.053 Technical Airworthiness Management Manual
- Defence regulations and instructions
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Quality manuals
- Procedures manuals
- Standing instructions
- Work instructions
- WHS legislation (state/territory and Commonwealth)

Initiatives for bringing about improvements arise from:

- Changes to organisational policy and procedures
- Reform of regulations
- Changes to training and authorisation requirements
- Management review processes
- Suggestions from individual stakeholders
- Availability of new tools or support equipment
- Availability of new management technology
- Industry or original equipment manufacturer periodicals and newsletters
- Feedback from other operators of the aircraft type or item of aeronautical product

Consultative processes include:

- Consultation with regulators where the change has a regulatory component
- Consultation with higher management where organisational policy and procedures are involved
- Consultation with stakeholders elsewhere in the logistic support network
- Consultation at all levels in the relevant area of the aviation maintenance environment
- Consultation with stakeholders in the industrial relations system

- Consultation with suppliers of management systems, tooling or support equipment

Unit Mapping Information

Release 1 – equivalent to MEA124B Coordinate change programs in the aviation maintenance environment

Assessment Requirements for MEA124 Coordinate change programs in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- interpersonal communication
- analysis techniques
- problem solving
- team skills
- monitoring and observation.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- strengths, weaknesses, opportunities, threats (SWOT) analysis
- organisational structure and culture
- policy and procedures
- legislation and regulations
- effects of change in the workplace
- change strategies
- WHS, equity, fraud and ethics.
-

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations when coordinating change programs in aviation maintenance.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.

- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

ME A125 Develop aviation maintenance personnel

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of personnel management practices in the development and training of personnel within the aviation maintenance organisation performing scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

This unit of competency is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Mediate in and settle grievances and disputes | 1.1 Problem solving issue resolution procedures are conducted in accordance with relevant policy and procedures |
| | 1.2 Grievances and disputes are managed in a timely and respectful manner |
| | 1.3 Grievances and disputes are managed to optimise the likelihood of a favourable outcome for all parties |
| | 1.4 Individual's rights and obligations are respected and communicated in a clear and concise manner |

- 1.5 Interviews and meetings are conducted in a participative and consultative manner
 - 1.6 Outcomes of proceedings are recorded, stored and made available to authorised personnel in accordance with organisational policy and procedures
 2. Motivate team towards achieving quality output
 - 2.1 Team members needs and wants are recognised and where possible incorporated into work assignments consistent with their level of responsibility
 - 2.2 The team's achievements are promoted and rewarded in a way that openly acknowledges the importance of team members' contributions
 3. Control allocation of tasks to teams and individuals
 - 3.1 Tasks are allocated to teams and individuals to take into account the needs of the organisation's operational requirements, individual/team goals, development needs, and individual strengths, qualifications and authorisations
 - 3.2 Prompt corrective action is taken in response to actual or potential significant deviations from plans
 4. Evaluate and report individual performance
 - 4.1 Performance expectations based on an individual's situation and work requirements are identified and agreed
 - 4.2 Individual performance is reviewed on an ongoing basis against performance expectation
 - 4.3 Feedback is provided in a constructive manner
 - 4.4 Reporting on individual performance is in accordance with the organisation's policies and procedures
 - 4.5 Performance issues that cannot be rectified or addressed are referred to appropriate personnel according to the organisation's policies and procedures
 5. Coordinate individual training
 - 5.1 Individual training requirements are identified to meet the needs of the individual and the organisation
 - 5.2 Individual training is delivered
 - 5.3 Opportunities for individuals to develop and apply competencies on the job are facilitated

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Relevant policy and procedures are found in:

- Organisational policy manuals
- Maintenance organisation manual
- Maintenance management plan
- Procedures manuals
- Work instructions
- Government legislation
- Defence regulations and instructions
- Standing instructions
- Grievance procedures
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions

Grievances and disputes include:

- Progress towards qualifications
- Employment area
- Sexual harassment
- Equity and diversity
- Employment conditions
- Interpersonal differences

Qualifications and authorisations include:

- Training Package qualifications issued under the Australian Qualifications Framework (AQF)
- Certificates issued by Registered Training Organisations (RTOs) for completion of non-accredited training courses
- Certificates issued on completion of equipment-related training courses
- Maintenance engineer licences and extensions thereto
- Aviation maintenance specialist certificates
- Authorisations as a CASA representative made under the provision of CARs or CASRs
- Task authorisations made in accordance with maintenance organisation expositions or continuing airworthiness

- management organisation expositions
- Task authorisations made in accordance with relevant Defence regulations and instructions
- Task authorisations made in accordance with a maintenance management plan

Unit Mapping Information

Release 1 – equivalent to MEA125B Develop aviation maintenance personnel

Links

Companion Volume implementation guides are found in VETNet -
<https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA125 Develop aviation maintenance personnel

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- negotiation and dispute resolution
- performance appraisal
- interpersonal communication
- interviewing
- planning
- application of requirements regarding matching of allocated jobs with qualification and task authorisations.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- relevant government legislation
- Civil Aviation Regulations (CARs) and Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- maintenance organisation expositions
- continuing airworthiness management organisation expositions
- relevant Defence Regulations and instructions
- maintenance organisation manuals
- work health and safety (WHS) legislation
- organisational safety manuals
- organisational policy and procedures manuals
- organisational performance appraisal reporting requirements
- personnel development principles and practices
- equity and diversity
- fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered when developing aviation maintenance personnel.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

ME126 Manage aircraft maintenance activities

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge required to develop, implement and evaluate the outcomes of aircraft maintenance activities performed on flight lines, in hangars and in workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|------------------------------------|---|
| 1. Develop a maintenance program | 1.1 Maintenance requirements for aircraft are determined from relevant documentation |
| | 1.2 Maintenance tasks are analysed and prioritised |
| | 1.3 Resource requirements are identified and allocated to ensure the timely and efficient completion of maintenance tasks |
| 2. Implement a maintenance program | 2.1 Roles and responsibilities of maintenance personnel are communicated and agreed |
| | 2.2 Appropriate resources and equipment to achieve |

- scheduled tasks are considered and arranged, including relevant material safety data sheets (MSDS) and personal protective equipment (PPE)
- 2.3 Maintenance personnel are regularly consulted to ensure scheduled tasks are being achieved
 - 2.4 Management/stakeholder updates on maintenance progress are provided through verbal reports and briefings, and through written reports, including notes, worksheets and briefs
 - 2.5 Maintenance activities are monitored to ensure compliance with authorised instructions, policies and procedures
 - 2.6 Advice and assistance with maintenance activities are provided as required
 - 2.7 Maintenance problems are identified and/or anticipated and avoided or controlled in accordance with the maintenance program
 - 2.8 Maintenance program effectiveness is reviewed and analysed
 - 2.9 Proposed changes to the maintenance program are identified, investigated and negotiated with management/stakeholders
3. Evaluate and report maintenance outcomes
 - 3.1 Final maintenance outcomes are evaluated against the program in accordance with organisational policies and procedures
 - 3.2 Maintenance reports are collated, evaluated and forwarded to appropriate authorities in accordance with organisational policies and procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect

performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Maintenance requirements for aircraft include:

- Maintenance of the airframe and aircraft systems, power plant, avionic systems and fitted role equipment

Relevant documentation includes:

- Computer data systems
- Log books
- Authorised maintenance manuals
- Management directives
- Feedback from maintenance and operating personnel
- Aircraft flight and technical records
- Aircraft maintenance program
- Civil Aviation Regulations (CARs) and Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Airworthiness Directives (ADs)
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Aircraft type certificate design certificate
- Relevant Defence regulations and instructions

Maintenance tasks include:

- Scheduled
- Unscheduled
- Preventative
- Corrective

Resource requirements include:

- Personnel
- Spare parts and consumables
- Special equipment
- Ground support equipment, such as power carts and hydraulic rigs
- PPE
- Tools

Considerations regarding resource requirements include:

- Personnel numbers
- Personnel availability
- Personnel qualifications
- Personnel authorisations and experience
- Quantities and availability of parts, consumables special equipment, ground support equipment, PPE and tools

Authorised instructions, policies and procedures

- Manufacturers' operating manuals
- Management directives

include:

- Maintenance manuals
- Defence Regulations and instructions
- Standing instructions
- Maintenance management plans
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Procedures manuals
- Work instructions
- CARs or CASRs, Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Quality assurance instructions
- Work health and safety (WHS) policies and instructions
- MSDS

Advice and assistance with maintenance activities include:

- Work practices
- Fault diagnosis procedures
- Damage assessment
- Defect investigation
- Assessment of repair cost-effectiveness
- Assessment of repair versus replacement options
- Monitoring of telemetry maintenance data from aircraft during flight operations

Maintenance problems include:

- Lack of resources or data
- Unanticipated breakdowns or faults
- Changes in priorities

Unit Mapping Information

Release 1 – equivalent to MEA126B Manage aircraft maintenance activities

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA126 Manage aircraft maintenance activities

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- using documentation and relevant regulations to determine maintenance and reporting requirements
- using MSDS to determine handling precautions and PPE requirements
- applying WHS requirements
- planning
- communicating
- questioning
- fault diagnosis techniques.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- sources of information relating to scheduled and unscheduled maintenance activities and configuration change requirements
- basic project planning techniques, including timing, prioritising, resourcing, monitoring and evaluation of maintenance tasks
- techniques for mapping maintenance activities and recording progress
- the aircraft and systems being maintained
- fault diagnosis and troubleshooting procedures, damage assessment philosophies and procedures, cost-effectiveness considerations for different repair types, philosophies and considerations in repair versus replacement options
- applicable regulations, organisational policy and procedures manuals, maintenance manuals and instructions
- MSDS
- WHS, equity, fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered when managing aircraft maintenance activities within the applicable airworthiness regulatory system.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA127 Provide technical advice in the maintenance and management of aircraft and aeronautical product

Modification History

Release 1 - New unit of competency

Application

This unit of competency is applied within the jurisdiction of the Civil Aviation Safety Authority (CASA). It requires application of technical knowledge to provide advice on the need for modifications, repairs and scheduled or unscheduled maintenance requirements for aircraft, aircraft systems and items of aeronautical product.

The unit is part of the Aeroskills Advanced Diploma training pathways.

Pre-requisite Unit

MEA705 Apply basic scientific principles and techniques in aeronautical engineering situations

and

MEA707 Select and test aeronautical engineering materials

OR

MEA706 Apply basic scientific principles and techniques in avionic engineering situations

and

MEA708 Select and test avionic engineering materials

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Develop an aircraft maintenance program and minimum equipment list | 1.1 The requirements for an aircraft maintenance program are determined from relevant regulations, and organisational policies and procedures |
| | 1.2 An applicable maintenance program is identified or is drafted in accordance with regulatory guidelines |
| | 1.3 The proposed maintenance program is submitted for approval |
| | 1.4 The requirement for a minimum equipment list is determined from relevant regulations, and organisational policies and procedures |
| | 1.5 A minimum equipment list is compiled and submitted for approval in accordance with relevant regulations, and organisational policies and procedures |
| 2. Develop a continuing airworthiness management organisation exposition | 2.1 The need for a continuing airworthiness management organisation exposition is determined from relevant regulations |
| | 2.2 A continuing airworthiness management organisation exposition is drafted and submitted for approval in accordance with organisational policies and procedures |
| 3. Develop a maintenance organisation exposition | 3.1 The requirement for a maintenance organisation exposition is determined from relevant regulations |
| | 3.2 A maintenance organisation exposition is drafted in accordance with regulatory guidelines, and organisational policies and procedures |
| 4. Provide mechanical advice in aircraft maintenance | 4.1 Independent technical input is provided with regard to aircraft structure and mechanical systems/components |
| | 4.2 Knowledge of aircraft structures and specialist input is utilised to determine airworthiness |

- | | | |
|----|---|---|
| | 4.3 | Knowledge of aircraft mechanical systems/components and specialist input is utilised to determine airworthiness |
| 5. | Provide avionic advice in aircraft maintenance | 5.1 Independent technical input is provided with regard to avionic systems/components |
| | 5.2 | Knowledge of avionic systems/components and specialist input is utilised to determine airworthiness |
| 6. | Evaluate and review aircraft maintenance and management system elements | 6.1 Aircraft operation and maintenance trends are monitored |
| | 6.2 | Maintenance management system elements are reviewed against trends and amendments are proposed in accordance with regulatory requirements, and organisational policies and procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Relevant regulations and organisational policies and procedures include:

- Civil Aviation Regulations (CARs) and Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Policy manuals
- Procedures manuals
- Quality manuals
- Defect investigation and compilation of service difficulty reports
- Modification proposals
- Repair scheme proposals
- Proposed amendments to servicing schedules and

Independent technical input includes:

- maintenance data and programs
- Advice to maintenance personnel, senior maintenance managers and higher technical/regulatory authorities
- Aircraft structure includes:**
 - Primary and secondary structural components
 - Seating and cargo restraints
- Mechanical systems/components include:**
 - Engines and engine systems and components
 - Propellers and propeller system components
 - Landing gear systems and components
 - Hydro-mechanical systems comprising hydraulic, pneumatic, fuel and components
 - Mechanical systems and components
 - Electrical systems and components
 - Oxygen
 - Furnishings and safety equipment
- Specialist input includes:**
 - Professional engineers
 - Non-Destructive Testing (NDT) technicians
 - Licensed Aircraft Maintenance Engineers (LAMEs) with applicable ratings
 - Personnel with Civil Aviation Safety Regulation (CASR) Part 145 or Part 42F certifying authorities
- Avionic systems/components include:**
 - Electrical power generation and distribution
 - Electrical systems
 - Control and warning systems
 - Flight instruments
 - Aircraft data communication
 - Automatic flight and engine control systems
 - Communication systems
 - Navigation systems
 - Radar
 - Role equipment, such as forward looking infra-red (FLIR) pods
- Aircraft operation and maintenance trends are obtained from:**
 - Aircraft flight and technical records
 - Service difficulty reports
 - Maintenance worksheets
 - Log books
 - Continuing analysis maintenance program reports
 - Data from manufacturers and other operators
- Management system elements include:**
 - Aircraft maintenance program
 - Minimum equipment list
 - Continuing airworthiness management organisation exposition
 - Maintenance organisation expositions

Unit Mapping Information

Release 1 – equivalent to MEA127B Provide technical advice in the maintenance and management of aircraft and aeronautical product

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA127 Provide technical advice in the maintenance and management of aircraft and aeronautical product

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- written and oral communication
- using regulations, policies and procedures to set up maintenance control and management systems
- effective use of trend data and specialist advice to determine airworthiness and propose variations to maintenance schedules, repairs and modifications.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- CARs and CASRs relating to aircraft/aeronautical product maintenance and maintenance control
- organisational policies and procedures relating to aircraft/aeronautical product maintenance and maintenance control
- aircraft structure
- mechanical systems and components
- aircraft power plants
- avionic systems and components
- work health and safety (WHS), equity, fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered when providing advice in the maintenance and management of aircraft and aeronautical product within the CASA airworthiness regulatory system.

- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA128 Provide engineering advice in the modification, maintenance and management of aircraft systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency is applied within the airworthiness jurisdiction of the Australian Defence Force (ADF). It covers the provision of engineering advice in the Defence airworthiness environment on mechanical and avionics systems. The advice is provided in relation to the modification, repair, scheduled and unscheduled maintenance and management of aircraft and associated mechanical and avionic systems.

The unit is part of the Aeroskills Advanced Diploma training pathways.

Pre-requisite Unit

MEA705 Apply basic scientific principles and techniques in aeronautical engineering situations

and

MEA707 Select and test aeronautical engineering materials

OR

MEA706 Apply basic scientific principles and techniques in avionic engineering situations

and

MEA708 Select and test avionic engineering materials

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Provide mechanical systems advice | 1.1 Independent technical input in the maintenance, repair and modification design relating to aircraft mechanical systems and structures is provided when requested by maintenance personnel, senior maintenance managers and higher technical authorities |
| | 1.2 Aircraft mechanical systems knowledge is utilised to determine aircraft airworthiness |
| | 1.3 Knowledge of aircraft structures is utilised to determine aircraft airworthiness |
| 2. Provide avionic systems advice | 2.1 Independent technical input in the maintenance and modification design for aircraft avionic systems is provided when requested by maintenance personnel, senior maintenance managers and higher technical authorities |
| | 2.2 Aircraft avionic systems knowledge is utilised to determine aircraft airworthiness |
| 3. Conduct/advise an aircraft recovery | 3.1 Battle/incident damage and operational capability of an aircraft is evaluated |
| | 3.2 Repair methods and/or limits are determined |
| | 3.3 An aircraft recovery is planned |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Independent technical input is provided:

- Utilising subject matter experts and documented technical information
- Verbally
- In writing
- In accordance with regulations and organisational policy and procedures
- To operators, engineering officers and executive personnel

Aircraft mechanical systems include:

- Engines
- Landing gear systems
- Hydro-mechanical systems comprising oil, fuel, hydraulic and pneumatic
- Furnishings and safety equipment
- Propellers

Aircraft structures include:

- Primary and secondary structure
- Flight controls
- Fairings
- Doors
- Access panels

Aircraft avionic systems include:

- Electrical generation and distribution
- Electrical systems
- Electrical control and warning
- Flight instruments
- Aircraft data communication
- Automatic flight and engine control
- Communications
- Navigation
- Radar
- Life support
- Ordnance

Unit Mapping Information

Release 1 – equivalent to MEA128B Provide engineering advice in the modification, maintenance and management of aircraft systems

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA128 Provide engineering advice in the modification, maintenance and management of aircraft systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- oral and written communication
- management
- damage assessment, including repair scheme development and/or extension
- development of modification proposals
- review of maintenance requirements.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- modification proposal development and processing
- repair scheme proposal, including equivalent strength repair design and justification for extension of an approved repair scheme
- management processes for monitoring and reviewing maintenance requirements
- aircraft structure
- aircraft mechanical systems
- aircraft avionic systems
- aircraft recovery procedures
- work health and safety (WHS), equity, fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered when providing engineering advice in the modification, maintenance and management of aircraft systems in the ADF technical airworthiness regulatory system.

- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA129 Investigate technical aspects of aviation occurrences

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of required procedures and of technical knowledge in investigating the technical aspects of aviation occurrences, including aircraft accidents, aircraft incidents and maintenance incidents within the Australian Defence Force (ADF) airworthiness jurisdiction. Work may be performed individually or as part of a team.

The unit is part of Advanced Diploma training pathways.

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-------------------------------------|---|
| 1. Notify authorities of occurrence | 1.1 Authorities are notified of the occurrence in accordance with ADF policy and procedures |
| | 1.2 Specialist advice is provided relevant to the occurrence |
| | 1.3 The investigation is planned in accordance with ADF and statutory requirements |
| 2. Collect evidence | 2.1 Evidence of personnel involved in the occurrence is documented |
| | 2.2 Witnesses are interviewed and information is documented |
| | 2.3 Evidence associated with the occurrence is collated |

- | | |
|----------------------------------|--|
| 3. Analyse occurrence | 3.1 Information is analysed in accordance with the established objectives of the investigation |
| | 3.2 Options for action are generated which are consistent with ADF and/or statutory requirements and lead to recommendations that reduce future risk |
| | 3.3 Criteria are specified to enable objective evaluation of the options to be undertaken |
| 4. Produce report | 4.1 All evidence is reviewed and satisfactory engineering conclusions and recommendations are made |
| | 4.2 Conclusions are reviewed with stakeholders |
| | 4.3 Recommendations are costed |
| | 4.4 Formal reports are produced in accordance with ADF policy and procedures and forwarded to appropriate authorities |
| 5. Implement corrective measures | 5.1 Measures selected for implementation are feasible in terms of practicality and costing |
| | 5.2 Measures are implemented |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Occurrences include:

- Aircraft accidents
- Aircraft incidents
- Maintenance incidents

The investigation can be conducted by any or all of:

- Visual observation
- Interviews
- Review of statements
- Technical investigation

- Formal reports include:**
- Accident and incident reports
 - Safety reports
 - Defect reports
 - Investigation reports

Unit Mapping Information

Assessment Requirements for MEA129 Investigate technical aspects of aviation occurrences

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- oral and written communication
- interviewing
- management and analysis of evidence
- technical aspects relating to the investigation.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- ADF policy and procedures
- investigation procedures
- technical aspects relating to the aircraft type and its systems
- application of a no blame culture
- culpability matrix
- equity, fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered during the technical investigation of aviation occurrences within the ADF airworthiness regulatory system.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

ME A130 Manage deployed/detached aviation maintenance activities

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge required to plan deployed aircraft maintenance, provide support to deployed maintenance personnel and monitor and evaluate their activities within the Australian Defence Force (ADF) airworthiness jurisdiction. Applications include the deployment and detachment away from home base of aircraft that are to be supported by a deployed maintenance team for scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of Advanced Diploma training pathways.

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Plan aircraft detachment maintenance activities

- 1.1 Deployment/detachment objectives are ascertained
- 1.2 Resource requirements are identified, obtained and allocated
- 1.3 Maintenance personnel qualifications and authorisations are validated
- 1.4 Liaison with detachment locality authorities is established
- 1.5 Detachment activities are scheduled

- | | | | |
|----|--|-----|---|
| 2. | Prepare maintenance plan | 2.1 | Maintenance plan incorporates short and long-term goals in line with flight/squadron objectives and priorities |
| | | 2.2 | Maintenance plan conforms to airworthiness regulations, ADF policies and procedures |
| | | 2.3 | Realistic and relevant work objectives are developed |
| | | 2.4 | The maintenance plan reflects the resources available |
| 3. | Detach aircraft | 3.1 | Pre-detachment inspections are performed and deficiencies are reported in accordance with ADF policy and procedures |
| | | 3.2 | Personnel briefings are provided |
| | | 3.3 | Aircraft and equipment are despatched |
| 4. | Exercise limited engineering authority | 4.1 | Maintenance interval extension requests are submitted as required |
| | | 4.2 | Carried forward unserviceabilities are authorised |
| 5. | Provide technical airworthiness/engineering advice | 5.1 | Technical advice relating to maintenance and to design of modifications and repairs to aircraft structure/systems is provided to higher authorities |
| 6. | Monitor and evaluate maintenance activities | 6.1 | Maintenance outcomes are assessed against the maintenance plan goals and objectives |
| | | 6.2 | Deviations/problems are identified, analysed and appropriate responses are initiated |
| | | 6.3 | Maintenance outcomes are recorded and reported in accordance with ADF policy and procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Deployment/detachment sites include:**
- Military airfields within Australia or overseas
 - Civilian airfields within Australia or overseas
 - Unprepared areas of operations within Australia and overseas
- Resource requirements include:**
- Personnel
 - Spare parts/fly-away kits
 - Ground support equipment
 - Facilities
 - Vehicles
 - Finance
- Maintenance personnel qualifications and authorisations include:**
- Duty statements
 - Job descriptions
 - Maintenance personnel authorisation workbooks
- Detachment locality authorities include:**
- Military command
 - Location facilities personnel
 - Civilian authorities
 - Other detached units or organisations
- Airworthiness regulations, ADF policies and procedures include:**
- Aircraft maintenance regulations
 - Safety manuals
 - Work health and safety (WHS) legislation
 - Defence instructions
 - Standing instructions
 - Local instructions
 - Specific aircraft/equipment maintenance manuals
 - Servicing schedules
- Pre-detachment inspections include:**
- Facilities/accommodation
 - Fuel
 - Technical facilities
 - Site survey
 - Spare parts
 - Fire-fighting equipment
 - Personal protective equipment (PPE)
- Higher authorities include:**
- Authorised maintenance organisations
 - Authorised engineering organisations
 - Director General Technical Airworthiness
 - Senior commanders

Unit Mapping Information

Release 1 – equivalent to MEA130A Manage deployed/detached aviation maintenance activities

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA130 Manage deployed/detached aviation maintenance activities

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- planning
- communication
- problem solving
- liaison
- management.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- airworthiness regulations
- relevant instructions
- aircraft maintenance documentation
- maintenance report compilation
- modifications and deviations
- defects and safety reports
- equity, fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations that are encountered in managing deployed/detached aviation maintenance within the ADF airworthiness regulatory environment.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.

- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA131 Manage the custody, transfer and disposal of aircraft, aeronautical product and support equipment

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of procedures relating to the custody, transfer and disposal of aircraft, aeronautical product and support equipment, including test equipment and ground support equipment, used in scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Advanced Diploma training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| <p>1. Maintain proper custody of aircraft, aeronautical product and support equipment</p> | <p>1.1 Aircraft and aeronautical product are maintained and/or stored in facilities or circumstances that comply with regulatory requirements, and organisational policies and procedures</p> <p>1.2 Special test equipment is stored in appropriate environmental conditions and calibration is carried out at required intervals</p> <p>1.3 Ground support equipment is stored and operated in an</p> |
|---|---|

- environment that will prevent undue deterioration or wear
- 1.4 Storage and control requirements are observed for hazardous and controlled materials
 - 1.5 Maintenance records and documentation are maintained in accordance with regulatory requirements, and organisational policies and procedures
2. Transfer aircraft, aeronautical product and support equipment between organisations
 - 2.1 Aircraft, aeronautical product and support equipment are transferred between organisations in accordance with regulatory requirements, and organisational policies and procedures
 - 2.2 Documentation and maintenance records are transferred between organisations in accordance with regulatory requirements, and organisational policies and procedures
3. Dispose of aircraft, aeronautical product and support equipment
 - 3.1 Aircraft, items of aeronautical product and support equipment are correctly classified for disposal and appropriate documentation is compiled to allow disposal in accordance with regulatory requirements, and organisational policies and procedures
 - 3.2 Aircraft and items of aeronautical product are prepared as directed for disposal
 - 3.3 Maintenance records and documentation are retained and stored in accordance with regulatory requirements, and organisational policies and procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Regulatory requirements,

- Civil Aviation Regulations (CARs) and associated

**and organisational policies
and procedures include:**

- Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Policy manuals
- Procedures manuals
- AAP 7001.053 Technical Airworthiness Management Manual
- Defence Regulations and instructions
- Maintenance management plans
- Standing instructions

**Special test equipment
includes:**

- Measuring equipment
- Non-Destructive Testing (NDT) equipment
- System test boxes
- Test stands
- Automatic test equipment

**Ground support equipment
includes:**

- Power carts
- Hydraulic rigs
- Pneumatic rigs
- Refuelling equipment
- Towing equipment

**Hazardous and controlled
materials include:**

- Chemicals classified as hazardous
- Items, such as Halon fire-extinguishers, that require an Environmental Protection Authority (EPA) licence for storage
- Materials that have EPA standards for storage and use

Assessment Requirements for MEA131 Manage the custody, transfer and disposal of aircraft, aeronautical product and support equipment

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- administration
- management
- application of technical knowledge in the custody and disposal of aircraft, aeronautical product and support equipment
- compliance with regulatory requirements
- compliance with environmental protection requirements.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- aircraft maintenance requirements/instructions
- aeronautical product maintenance requirements
- test equipment calibration requirements
- regulatory requirements relating to custody, transfer and disposal of aircraft, aeronautical product, support equipment and environmental protection
- organisational policies and procedures relating to custody, transfer and disposal of aircraft, aeronautical product and support equipment.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations that would be encountered in managing the custody, transfer and disposal of aircraft, aeronautical product and support equipment under the applicable airworthiness regulatory system.

- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA132 Manage budgetary resources in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of procedures for the development and monitoring of a budget for scheduled and unscheduled maintenance in aircraft and aeronautical product maintenance organisations, including engineering and logistic support areas. Work may be performed individually or as part of a team.

It covers the competencies required to manage budgeting activities in aircraft and aeronautical product maintenance and logistic support activities other than major maintenance budgets associated with integrated logistic support (ILS) maintenance programs. Competencies related to these programs are partly covered by MEA139 Perform aviation maintenance-related integrated logistic support management activities. Individuals involved in the management of such programs may, as an alternative to MEA132, consider attainment of PSPMNGT610A Manage public sector financial resources, from the PSP12 Public Sector Training Package. Those who are accountable managers of maintenance organisations may, instead of this unit, consider attaining MEA146 Prepare and manage aviation maintenance organisation budgets and financial plans.

The unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|--|-----|--|
| 1. | Plan a budget | 1.1 | Workplace resource needs are identified and documented |
| | | 1.2 | Resource needs are costed |
| | | 1.3 | Budget document is prepared and processed in accordance with organisational requirements |
| 2. | Manage the acquisition and allocation of budgetary resources | 2.1 | Systems for monitoring expenditure are maintained |
| | | 2.2 | Budgets are monitored to ensure expenditure is within targets |
| | | 2.3 | Appropriate technology is applied to the resource management system |
| | | 2.4 | Changing priorities are identified and discussed with applicable personnel |
| | | 2.5 | Budget document is amended in response to changing activities or costs |
| | | 2.6 | Accountability requirements are satisfied |
| 3. | Evaluate and report budget outcomes | 3.1 | Expenditure against planned budget is evaluated |
| | | 3.2 | Impacts on financial changes/constraints on work unit objectives are evaluated and documented |
| | | 3.3 | Report on expenditure/budget is prepared in accordance with organisational policies and procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Workplace resource needs • Personnel

include:

- Finance
- Equipment
- Facilities
- Items of aeronautical product
- Breakdown spares and materials
- Consumables

Budgets include:

- Annual
- Length of project/activity
- Quarterly
- For another period of time, as required

Systems for monitoring expenditure include:

- Paper-based systems
- Computerised systems
- Receipts and invoices
- Quotes

Assessment Requirements for MEA132 Manage budgetary resources in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- financial management
- monitoring
- evaluation and decision making
- mathematical calculation.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- organisational budgetary processes
- tasking over the period of the budget
- requirements in Civil Aviation Safety Regulations (CASRs) regarding financial status of maintenance organisations
- fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations in the management of budgetary resources within the aviation maintenance environment.
- The candidate must have access to all materials and documentation required and must be permitted to refer to any relevant workplace procedures, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA133 Communicate aviation technical and maintenance management knowledge

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of written and oral communication skills relating to aviation technical and maintenance management knowledge. Applications include the evaluation of written technical communication and the delivery of verbal briefings during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Diploma and Advanced Diploma training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Evaluate written technical communication | 1.1 Content of written technical communication is checked for accuracy and appropriateness |
| | 1.2 Format is checked against regulatory requirements, and organisational policies and procedures |
| | 1.3 The need for additional information is identified and writer advised of same |

- | | | |
|----|---|---|
| | 1.4 | Verified communication is actioned in accordance with regulatory requirements, and organisational policies and procedures |
| 2. | Present technical and non-technical briefings | 2.1 Briefing is planned and prepared in a well-structured manner |
| | 2.2 | Briefing is delivered in an audible, articulate manner |
| | 2.3 | Information delivered is accurate |
| | 2.4 | Audiovisual equipment, where applicable, is used in an effective, professional manner |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Written technical communication includes:

- Instructions
- Reports
- Requests being submitted in accordance with regulatory requirements

Regulatory requirements, and organisational policies and procedures include:

- Civil Aviation Regulations (CARs) and associated Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Policy manuals
- Procedures manuals
- Quality manuals
- Work instructions
- AAP 7001.053 Technical Airworthiness Maintenance Manual

Briefings are conducted for:

- Defence instructions
- Standing instructions
- Maintenance management plans
- Employees of the organisation
- Business associates, such as teaming partners
- Clients
- Contractors and subcontractors
- Representatives of regulatory bodies
- Higher authorities
- Visitors

Information includes:

- Changes to policy and procedures or regulations
- Workload requirements
- Organisational activities
- Organisational familiarisation
- Technical knowledge and skills
- Work procedures
- Non-technical matters

MEA134 Establish, maintain and evaluate the organisation's work health and safety system

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of work health and safety (WHS) legislation and principles to establish, maintain and evaluate a WHS system within the maintenance organisation, including on flight lines, in hangars and in workshops, during scheduled or unscheduled maintenance and may relate to individual and team activities. It is intended to ensure that the workplace is, so far as is practicable, safe and without risks to the health of employees.

The unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Work health and safety

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Establish and maintain the framework for the WHS system | 1.1 WHS policies are developed which clearly express the organisation's commitment with respect to WHS within the area of managerial responsibility and how relevant WHS legislation will be implemented, consistent with overall organisational policies |
| | 1.2 WHS responsibilities and duties which will allow implementation and integration of the WHS system are clearly defined, allocated and included in job descriptions |

and duty statements for all relevant positions

- 1.3 Financial and human resources for the operation of the WHS system are identified and sought in a timely and consistent manner
- 1.4 Information on the WHS system and procedures for the area of managerial responsibility is provided and explained in a form that is readily accessible to employees
2. Establish and maintain participative arrangements for the management of WHS
 - 2.1 Appropriate consultative processes are established and maintained in consultation with employees and their representatives in accordance with relevant WHS legislation and consistent with the organisation's overall process for consultation
 - 2.2 Issues raised through participation and consultation are dealt with and resolved promptly and effectively in accordance with procedures for issue resolution
 - 2.3 Information about the outcomes of participation and consultation is provided in a manner accessible to employees
3. Establish and maintain procedures for identifying hazards
 - 3.1 Existing and potential hazards within the area of managerial responsibility are correctly identified and identification confirmed in accordance with WHS legislation, codes of practice and trends identified from the WHS records system
 - 3.2 A procedure for ongoing identification of hazards is developed and integrated within systems of work and procedures
 - 3.3 Activities are appropriately monitored to ensure that this procedure is adopted effectively throughout the area of managerial responsibility
 - 3.4 Hazard identification is addressed at the planning, design and evaluation stages of any change in the workplace to ensure that new hazards are not created
4. Establish and maintain procedures for assessing risks
 - 4.1 Risks presented by identified hazards are correctly assessed in accordance with WHS legislation and codes of practice
 - 4.2 A procedure for ongoing assessment of risks is developed and integrated within systems of work and procedures

- 4.3 Activities are monitored to ensure that this procedure is adopted effectively throughout the area of managerial responsibility
 - 4.4 Risk assessment is addressed at the planning, design and evaluation stages of any change within the area of managerial responsibility to ensure that the risk from hazards is not increased
- 5. Establish and maintain procedures for controlling risks
 - 5.1 Measures to control assessed risks are developed and implemented in accordance with the hierarchy of control, relevant WHS legislation, codes of practice and trends identified from the WHS records system
 - 5.2 When measures that control a risk at its source are not immediately practicable, interim solutions are implemented until a control measure is developed
 - 5.3 A procedure for ongoing control of risks, based on the hierarchy of control, is developed and integrated within general systems of work and procedures
 - 5.4 Activities are monitored to ensure that the risk control procedure is adopted effectively throughout the area of managerial responsibility
 - 5.5 Risk control is addressed at the planning, design and evaluation stages of any change within the area of managerial responsibility to ensure that adequate risk control measures are included
 - 5.6 Inadequacies in existing risk control measures are identified in accordance with the hierarchy of control, and resources enabling implementation of new measures are sought and/or provided according to appropriate procedures
- 6. Establish and maintain organisational procedures for dealing with hazardous events
 - 6.1 Potential hazardous events are correctly identified
 - 6.2 Procedures which would control the risks associated with hazardous events and meet any legislative requirements as a minimum are developed in consultation with appropriate emergency services
 - 6.3 Appropriate information and training is provided to all employees to enable implementation of the correct procedures in all relevant circumstances
- 7. Establish and maintain a
 - 7.1 A WHS training program is developed and implemented

WHS training program	to identify and fulfil employees' WHS training needs as part of the organisation's general training program
8. Establish and maintain a system for WHS records	8.1 A system for keeping WHS records is established and monitored to allow identification of patterns of occupational injury and disease within the area of managerial responsibility
9. Evaluate the organisation's WHS system and related policies, procedures and programs	9.1 The effectiveness of the WHS system and related policies, procedures and programs is assessed according to the organisation's aims with respect to WHS 9.2 Improvements to the WHS system are developed and implemented to ensure more effective achievement of the organisation's aims with respect to WHS 9.3 Compliance with WHS legislation and codes of practice is assessed to ensure that legal WHS standards are maintained as a minimum

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

This competency is to be exhibited in accordance with all relevant WHS legislation, particularly:

- Commonwealth/state/territory WHS Acts, regulations and codes of practice, including regulations and organisational codes of practice relating to hazards present in the workplace
- General duty of care under WHS legislation and common law; requirements for the maintenance and confidentiality of occupational injury and disease
- Requirements for provision of WHS information and training
- Provisions relating to health and safety representatives and/or WHS committees
- Provisions relating to WHS issue resolution
- Civil Aviation Safety Regulations (CASRs), Manuals of

Standards and associated Acceptable Means of Compliance and Guidance Material

- WHS framework includes:**
- Policy development and updating
 - Determining the ways in which WHS functions will be managed. This may include distinct WHS management activities, or inclusion of WHS functions within a range of management functions and operations, such as maintenance of plant and equipment; purchasing of materials and equipment
 - Designing operations, work flow and materials handling; planning or implementing alterations to site, plant, operations or work systems; mechanisms for review and allocation of human, technical and financial resources needed to manage WHS, including defining and allocating WHS responsibilities for all relevant positions
 - Mechanisms for keeping up to date with relevant information and updating the management arrangements for WHS, for example, information on health effects of hazards, technical developments in risk control and environmental monitoring and changes to legislation
 - Mechanisms to assess and update WHS arrangements relevant to legislative requirements; a system for communicating WHS information to employees, supervisors and managers within the enterprise
- Appropriate consultative processes for management of WHS include:**
- WHS committees and other committees, for example, consultative, planning and purchasing
 - Health and safety representatives; employee and supervisor involvement in WHS management activities, for example, WHS inspections, audits, environmental monitoring, risk assessment and risk control
 - Procedures for reporting hazards, risks and WHS issues by managers and employees
 - Inclusion of WHS in consultative or other meetings and processes
- Procedures for identifying**
- Workplace inspections, including plant and equipment;

hazards include:

audits

- Maintaining and analysing WHS records, including environmental monitoring and health surveillance reports
- Maintenance of plant and equipment
- Reviews of materials and equipment purchases, including manufacturers and suppliers information
- Employee reporting of WHS issues

Procedures for assessing risks include:

- Determining the likelihood and severity of adverse consequences from hazards
- WHS audits; workplace inspections; maintenance of plant and equipment; purchasing of materials and equipment
- Planning or implementing alterations to site, operations or work systems
- Analysis of relevant records and reports, for example, injuries and incidents, hazardous substances inventories/registers, audit and environmental monitoring reports and WHS committee records

Procedures for controlling risks include:

- Assessing the WHS consequences of materials, plant or equipment prior to purchase
- Obtaining expert advice; appropriate application of measures according to the hierarchy of control, namely: elimination of the risk
- Engineering controls
- Administrative controls
- Personal protective equipment (PPE)
- Designing safe operations and systems of work; inclusion of new WHS information into procedures
- Checking enterprise compliance with regulatory requirements

Organisational procedures for hazardous events include:

- Making inventories of, and inspecting, high risk operations
- Inspecting systems and operations associated with potentially hazardous events, for example, emergency communications, links to emergency services, firefighting, chemical spill containment, bomb alerts and first aid services

A WHS training program includes:

- Arrangements for ongoing assessment of training needs, for example, relating to supervisors and managers
- Specific hazards; specific tasks or equipment
- Emergencies and evacuations
- Training required under WHS legislation
- Allocation of resources for WHS training, including acquisition of training resources, development of staff training skills and purchase of training services
- Induction training; training for new operations, materials

- or equipment
- WHS records include:**
- Identifying records required under WHS legislation, for example, worker's compensation and rehabilitation records
 - Hazardous substances registers; material safety data sheets (MSDS)
 - Major accident/injury notifications
 - Certificates or licences
 - Manufacturers and suppliers WHS information
 - WHS audits and inspection reports
 - Maintenance and testing reports
 - Workplace environmental monitoring and health surveillance records
 - Records of instruction and training
 - First aid/medical post records
- Assessment of the effectiveness of the WHS system and related policies, procedures and programs includes:**
- Reviewing the effectiveness of the WHS management system
 - Regular review of operating procedures
 - Regular analysis of WHS records
 - Audits against WHS legislative requirements

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA134 Establish, maintain and evaluate the organisation's work health and safety system

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- ability to analyse working environment and design appropriate WHS management systems
- ability to analyse relevant data and evaluate WHS system effectiveness
- ability to assess resources to establish and maintain WHS management systems.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- provisions of relevant WHS legislation
- principles and practice of effective WHS management
- management arrangements relating to regulatory compliance
- enterprise hazards and risks, control measures and relevant expertise required
- characteristics and composition of workforce and their impact on WHS management
- relevance of enterprise management systems to WHS management.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations in establishing, maintaining and evaluating a WHS system
- The candidate must have access to all equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA135 Use computers in aviation maintenance-related integrated logistic support activities

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to the use of the internet, word processing, spreadsheets, databases and project planning software to perform tasks relating to integrated logistic support (ILS) activities associated with aviation maintenance, including aircraft technical records and compliance with regulatory requirements relating to the compilation and safeguarding of data during scheduled or unscheduled maintenance.

The unit is part of the Aeroskills Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Integrated logistic support

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | |
|---------------------------------|-----|---|
| 1. Use word processing software | 1.1 | Correspondence is drafted using word processing software |
| | 1.2 | Reports, including tables, are drafted using word processing software |
| | 1.3 | Instructions are drafted and amended using word processing software |
| 2. Use spreadsheets | 2.1 | Spreadsheets used within the enterprise are used to obtain |

- data
 - 2.2 Enterprise spreadsheets are updated through data input
 - 2.3 A simple spreadsheet is developed for a typical ILS-related application
 - 3. Use databases
 - 3.1 Databases used for maintenance-related ILS activities within the enterprise are used to obtain data
 - 3.2 Databases are populated with data as required
 - 4. Use project-planning software
 - 4.1 Project-planning software is used to plan a typical maintenance-related ILS task
 - 4.2 Project-planning software is used to monitor the progress of a task
 - 4.3 Data is entered into enterprise maintenance task management software and is used where applicable
 - 5. Use the internet
 - 5.1 Regulatory information is obtained from applicable internet websites
 - 5.2 Technical data is obtained from internet websites
 - 6. Maintain and store backup copies of data
 - 6.1 Required media for backup copies of data is determined
 - 6.2 Backup copies of data are made and are updated as required by regulatory requirements, and organisational policies and procedures
 - 6.3 Backup copies of data are stored in accordance with regulatory requirements, and organisational policies and procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional

contexts) are included.

ILS-related spreadsheet applications include:

- Costing a maintenance task or proposed modification
- Assessing the economic value of a proposed repair
- Costing a training program for maintenance personnel
- Management of items of aeronautical product both on and off aircraft
- Management of life critical parts
- Maintenance programs
- Life cycle costing data

Databases used for maintenance-related ILS activities include:

- Baselines for reliability, availability and maintainability
- Life support analysis record data
- Personnel task authorisations and training records
- Management of items of aeronautical product both on and off aircraft
- Management of life critical parts
- Maintenance programs

Maintenance-related ILS tasks using project planning software include:

- planning an aircraft maintenance task
- planning a modification program
- planning a maintenance personnel training program

Technical data includes:

- Standards
- Specifications
- Vendor data on materials, piece parts and components
- Engineering data

Required media for backup copies of data are specified in:

- Regulations
- Organisational policies and procedures
- Contract requirements

Regulatory requirements, and organisational policies and procedures include:

- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Aircraft maintenance programs
- Quality manuals
- Procedures manuals
- Work instructions
- AAP 7001.053 Technical Airworthiness Management Manual
- Defence Regulations and instructions
- Standing instructions
- Maintenance management plan

- Applicable overseas airworthiness regulations, such as Federal Aviation Regulations and European Aviation Safety Regulations

Assessment Requirements for MEA135 Use computers in aviation maintenance-related integrated logistic support activities

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- use of word processing software
- development and use of spreadsheets
- populating and obtaining data from databases
- use of project planning software
- use of the internet to obtain regulatory and technical data.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- types of word processing software commonly used in the maintenance-related ILS environment
- development and use of spreadsheets
- database usage in the maintenance-related ILS environment
- use of project planning software and the types of task management software used by maintenance organisations
- internet websites relating to regulatory requirements, standards and specifications
- use of internet search engines to obtain technical and commercial data
- procedures for backing up and storing data.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations involving the use of computers in maintenance-related ILS activities.
- The candidate must have access to all equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.

- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA136 Assess aviation maintenance spares and manage repairable items

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge required to apply integrated logistic support (ILS) procedures in the assessment of spares and the management of repairable items, including aircraft and mechanical and avionic items of aeronautical product, during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA135 Use computers in aviation maintenance-related integrated logistic support activities

Competency Field

Integrated logistic support

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Perform spares assessment activities | 1.1 Enterprise spares assessment and supply information systems are identified and applied |
| | 1.2 Maintenance data, spares usage data and trends are monitored and required holdings of spares are varied as |

- required
- 1.3 Spares availability problems are identified and strategies are determined to resolve the problems
 - 1.4 Where applicable, suitable substitute parts are identified and necessary engineering approvals obtained in accordance with applicable regulations, and organisational policies and procedures
 - 1.5 Acceptable sources of substitute parts are identified and requirements for documentation, such as certification reports and release notes, are specified in accordance with regulatory requirements, and organisational policies and procedures
 - 1.6 Configuration management (CM) requirements are observed in spares assessing
 - 1.7 Data required for input to ILS records is provided where applicable
2. Manage repairable items
- 2.1 Maintenance and reliability data is monitored and changes to maintenance programs are proposed where necessary
 - 2.2 Documentation is raised to allocate repairable items to maintenance facilities in accordance with contractual requirements, and organisational policies and procedures
 - 2.3 Any specific investigation or additional maintenance requirements are specified
 - 2.4 Data required for input to ILS records is provided where applicable

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work

situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Spares assessment and supply information systems include:

- Manual or computer-based systems
- Systems developed within the organisation or proprietary systems purchased by the organisation

Suitable substitute parts are identified from:

- Modification data
- Drawings, standards and specifications in the case of piece parts and materials
- Manufacturers catalogues and specifications in the case of complete components (items of aeronautical product)

Applicable regulations, and organisational policies and procedures include:

- Civil Aviation Regulations (CARs) and associated Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- AAP 7001.053 Technical Airworthiness Management Manual
- Organisational policy manuals
- Quality manuals
- Organisational procedures manuals
- Work instructions
- Defence regulations and instructions
- Maintenance management plan
- Standing instructions

ILS records include:

- Logistic support analysis plans
- Life cycle costing data
- Failure modes, effects and criticality analysis
- Baselines for reliability, availability and maintainability
- Life support analysis record data

Repairable items include:

- Removable structural components
- Mechanical components
- Items of role equipment
- Hydraulic, pneumatic and fuel components
- Items of safety equipment
- Fire detection and extinguishing components
- Engines and engine components
- Propellers and rotors
- Electrical system components
- Instrument system components

Investigation or additional maintenance requirements Include:

- Radio system components
- Electronic systems components
- service difficulty (defect) report investigation
- Incident investigation
- Warranty claims
- Modifications
- Compliance with airworthiness directives or special technical instructions
- Service bulletin compliance

Unit Mapping Information

Release 1 – equivalent to MEA136A Assess aviation maintenance spares and manage repairable items

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA136 Assess aviation maintenance spares and manage repairable items

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- using software packages relevant to spares assessing and repairable item management
- oral communication
- written communication
- problem solving
- application of regulatory and procedural requirements
- identification and resolution of problems relating to availability of spares.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- ILS principles relating to spares assessing, repairable item management and CM
- software packages used by the enterprise for spares assessment, supply management and repairable item management
- use of drawings, standards and specifications to identify substitute piece parts and materials
- use of catalogues and specifications to identify substitute components (items of aeronautical product)
- regulations, organisational policies and procedures relating to spares assessment and repairable item management
- work health and safety (WHS) requirements relating to substitute piece parts, materials and components
- fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered in spares assessment and management of repairable items, especially in relation to component or piece-part substitution.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA137 Write aviation technical publications

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to the researching of data, drafting and processing of technical publications and amendments to technical publications, including maintenance manuals, operating instructions, parts catalogues, procedures manuals and related technical publications to support scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA135 Use computers in aviation maintenance-related integrated logistic support activities

Competency Field

Integrated logistic support

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|------------------|---|
| 1. Research data | 1.1 The required medium, style and layout are determined |
| | 1.2 Relevant data is obtained or accessed |
| | 1.3 Potential problems are identified and relevant experts are identified and consulted |

- | | | |
|----|--|---|
| | 1.4 | Problem resolution strategies are determined |
| 2. | Draft publication or publication amendment | <p>2.1 The publication or amendment is drafted using relevant guidelines and specified software package</p> <p>2.2 Required graphics are selected and illustrator briefs are raised</p> <p>2.3 Copyright legislation is observed</p> <p>2.4 Completed graphics are inserted into the draft and annotations/labels added</p> <p>2.5 The draft is prepared for publishing and is submitted for editorial review</p> |
| 3. | Process draft publication or amendment | <p>3.1 Proof copy of the publication or amendment is submitted for client acceptance</p> <p>3.2 Publication or amendment is published</p> <p>3.3 The publication management database is updated and the completed publication is delivered or distributed</p> |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

The required medium can be one or more of:

- Print-based
- Electronic
- Microfiche

Style and layout can be determined from one or more of:

- An applicable style guide
- Contract requirements
- Industry standards and specifications

Relevant data sources

- Design and production data and drawings

include:

- Parts and materials listings
- Operating procedure documentation
- Maintenance schedules
- Modification instructions and service bulletins
- Manufacturer's and trade catalogues
- Relevant legislation and regulations

Relevant experts include:

- The client
- Design engineers and staff
- Production staff
- Component and material suppliers
- Regulator representatives

Unit Mapping Information

Release 1 – equivalent to MEA137A Write aviation technical publications

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA137 Write aviation technical publications

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria at least once under the specified conditions of assessment.

Evidence must be provided that the candidate can:

- undertake research
- utilise applicable documentation standards and style manuals
- communicate orally
- produce written communications to the required level
- undertake problem solving
- use word processing software and graphics packages to produce draft technical publications.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- word processing and graphics packages used for technical publication and publication amendment drafting
- publication writing conventions, standards and specifications
- the use of style guides
- illustration techniques
- reading of engineering drawings, including:
 - standard drawing sheets and drawing layouts
 - types of drawing
 - engineering standards and specifications
 - technical terms and abbreviations
 - sectioned views
 - dimensioning
 - tolerancing of dimensions
 - types of fit
 - aircraft standard hardware

- screw threads
- threaded components and washers
- locking devices
- rivets
- special structural fasteners
- spur gears
- welding symbols and geometry tolerancing
- surface texture
- material specifications and metal surface treatment
- reading of electrical and electronic circuits and wiring diagrams
- development of system schematics
- development of block diagrams
- sketching
- use and development of logic charts
- development of fault diagnosis guides
- the preparation of illustrators' briefs
- the preparation of indexes to publication contents
- problem solving methodology
- regulations relating to technical publications
- work health and safety (WHS) legislation
- for print-based publications, procedures for processing drafts through desktop publishing to printing, binding and distribution
- for electronic format publications, the principles for publication database systems and the development of input data
- requirements for, and methods of, maintaining publication records.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the elements and performance criteria are fully covered across the range of conditions in the simulation scenarios.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.

- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA138 Perform aviation technical publication management activities

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to the application of editorial and management knowledge and skills in the production, publication, distribution and amendment of technical publications, including maintenance manuals, operating instructions, parts catalogues, procedures manuals and related technical publications used in scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA137 Write aviation technical publications

Competency Field

Integrated logistic support

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Manage the drafting and publication of technical publications

1.1 The required style for technical publications is determined and specified

1.2 Technical publication drafts are edited

- | | | |
|----|---|---|
| 2. | Manage the amendment of technical publications | 2.1 The requirement for publication amendment action is identified |
| | | 2.2 Amendment action is initiated |
| | | 2.3 Draft amendments are edited |
| 3. | Manage the distribution and control of technical publications | 3.1 A publication distribution and amendment status database is established |
| | | 3.2 Publications are managed in accordance with regulatory requirements, and organisational policies and procedures |
| | | 3.3 The operation of the publication distribution and control system is monitored |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Specifying style for technical publication includes:

- Determination of the client's requirements
- Identification of applicable standards and specifications for publications within the industry
- Identification of any applicable regulatory requirements
- Selection of an appropriate publishing system
- Development and issue of a style guide that specifies:
 - writing style
 - layout
 - fonts
 - graphics selection and conventions
 - procedures for dealing with copyright issues
 - requirements for processing of drafts
- Preparation for publication
- Publication user feedback

The requirement for

publication amendment action includes:

- Modifications to systems or components
- Test procedure development or refinement
- Quality system audits
- Service bulletins
- Compliance with regulatory requirements

The editing process includes checking for:

- Compliance with the style guide
- Completeness and ease of understanding
- Appropriate use of graphics
- Observance of applicable regulations and legislation including copyright
- Final draft mark-up for desktop publishing
- Application of version control procedures

Regulatory requirements, and organisational policies and procedures are found in:

- Civil Aviation Regulations (CARs) and associated Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Organisational policy manuals
- Procedures manuals
- Quality manuals
- AAP 7001.053 Technical Airworthiness Management Manual
- Defence Regulations and instructions
- Maintenance management plan
- Standing instructions

Unit Mapping Information

Release 1 – equivalent to MEA138B Perform aviation technical publication management activities

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA138 Perform aviation technical publication management activities

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- specifying the style and layout of technical publications
- determining the need for amendment action
- effective control of technical publication distribution
- oral communication
- written communication.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- layout, content, production and use of technical publication style guides
- applicable publication standards and systems, including Air Transport Association (ATA)100 and Australian Air Publications
- copyright legislation
- graphics conventions and techniques
- desktop publishing software systems
- printing methods
- binder systems
- regulations governing the production, amendment, custody and distribution of technical publications
- version control procedures.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations associated with aviation technical publication management, including all elements and performance criteria.

- The candidate must have access to all materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA139 Perform aviation maintenance-related integrated logistic support management activities

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to integrated logistic support (ILS) elements and related data management and analysis tools in the maintenance-related management and support of systems throughout their life of type. This includes support of scheduled and unscheduled maintenance on aircraft, aircraft systems, avionic systems and items of aeronautical product. Work may be performed individually or as part of a team.

The unit is part of Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Integrated logistic support

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Maintain logistic support analysis plans | 1.1 Logistic support analysis plans are reviewed in line with trends in system supportability and affordability |
| | 1.2 Revisions are proposed to logistic support analysis (LSA) plans |
| 2. Perform life cycle cost analysis | 2.1 Actual and anticipated costs through to life of type are identified |
| | 2.2 Cost data is analysed |

- | | | | |
|----|--|-----|---|
| 3. | Establish and maintain baselines for reliability, availability and maintainability (RAM) | 3.1 | Data on in-service reliability, availability and maintainability is gathered |
| | | 3.2 | Data is reviewed against established baselines and action is initiated to deal with deviations from the established baselines |
| 4. | Revise LSA record data | 4.1 | LSA parameters are analysed using current data |
| | | 4.2 | Analysis results are entered in the LSA record |
| 5. | Manage data | 5.1 | A technical data management system is developed and managed in accordance with contractual and regulatory requirements |
| | | 5.2 | The relevance of technical data is monitored and amendment action is initiated, where necessary |
| | | 5.3 | Logistic support management information systems are applied and supported |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Life cycle cost analysis includes:

- The systematic identification and analysis of all actual and anticipated costs associated with implementing and sustaining a system throughout its service life

Costs through to life of type arise from:

- Operation
- Engineering support
- Maintenance support
- Supply support
- Facilities costs
- Personnel costs

Data analysis and review includes:

- Using enterprise databases and analysis tools

- Analysis results include:**
- In-service failure mode effects and criticality analysis
 - Corrective maintenance analysis
 - Reliability centred maintenance analysis
 - Maintenance task analysis
 - Repair level analysis
- Regulatory requirements are found in:**
- Civil Aviation Regulations (CARs) or Civil Aviation Safety Regulations (CASRs)
 - AAP 7001.053 Technical Airworthiness Management Manual
- A technical data management system includes:**
- Maintenance of all applicable technical data
 - Retention of original and back-up data in separate locations
 - Storage in a manner that minimises the risk of data loss, theft or destruction
- The relevance of technical data is determined through:**
- Monitoring engineering, maintenance and supply support activities
 - Utilising user feedback

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- oral communication
- written communication
- populating and extracting data from databases
- task analysis
- applying ILS principles.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- ILS management and support philosophy and practice
- LSA concepts and methods, including:
 - preparation of LSA plans
 - management and conduct of LSA programs
 - supportability analysis
 - task analysis
 - LSA record population
- RAM determination and application, including:
 - baseline determination and application
 - RAM modelling
 - reliability and maintainability apportionment
- data management concepts and methods.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations involving the application of ILS activities covered by the elements, performance criteria and the range of conditions.
- The candidate must have access to all relevant ILS management tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA140 Supervise aviation maintenance teams and perform maintenance quality inspections

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to the management and supervision of aviation maintenance teams and the performance of maintenance quality inspections within the Australian Defence Force (ADF) and within contractor organisations maintaining ADF aircraft and items of aeronautical product during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of Diploma and Advanced Diploma training pathways.

Candidates must have been appointed as a Maintenance Quality Inspector (MQI) or Independent Inspector in order to be assessed for this unit of competency.

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-------------------------------|---|
| 1. Plan maintenance for teams | 1.1 Maintenance tasks are identified and interpreted from available maintenance data or schedule in accordance with organisational procedures |
| | 1.2 Workload is organised in order of priority taking into consideration all required maintenance tasks and specified timeframes |
| | 1.3 Required resources are identified and obtained |
| | 1.4 Tools and support equipment are checked for |

- serviceability and currency of calibration, where applicable
2. Implement team maintenance activities
 - 2.1 Maintenance tasks are allocated to team members after consideration of individual experience, qualifications and task authorisations
 - 2.2 Team members are clearly briefed on their responsibility and function in the team
 - 2.3 Team members are correctly authorised to operate the required items of ground support and test equipment
 3. Provide guidance
 - 3.1 Guidance is provided to team members appropriate to the complexity or criticality of the maintenance task and the experience level of the individual
 - 3.2 Guidance is provided in determining the cause of complex faults or faults not covered in maintenance manual fault diagnosis guides
 4. Monitor and certify maintenance quality
 - 4.1 Activities are checked and personnel are guided to ensure that maintenance is performed and certified in accordance with the applicable documentation, policies and procedures
 - 4.2 Check inspections are performed on completed work or work stages and certified in accordance with regulatory requirements, and policies and procedures
 5. Perform human resource management activities at the supervisor level
 - 5.1 Human factors affecting job performance are identified and addressed
 - 5.2 The possibility of maintenance errors is minimised
 - 5.3 Sound teamwork is maintained through an awareness of contributing factors
 - 5.4 Sound employment relations are maintained
 6. Perform workplace training tasks
 - 6.1 On-job training is delivered
 - 6.2 The Supervisor's Verification portion of the Workplace History Sheets (Section 3) of the Log of Industrial Experience and Achievement is completed
 - 6.3 Expert witness verification of competency for Workplace Assessors is provided, when required
 - 6.4 Opportunities for individuals to develop competencies are

provided

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Maintenance tasks include:**
- Scheduled maintenance
 - Unscheduled maintenance
 - Configuration changes
 - Modification incorporation
 - Repair
 - Overhaul
- Maintenance data or schedule includes any or all of:**
- Maintenance records
 - Maintenance manuals
 - Servicing schedules
 - Computer maintenance data systems
 - Service bulletins
 - Special technical instructions
 - Modification orders
 - Repair instructions
 - Observations and feedback from maintenance personnel and aircrew
 - Internal work instructions or management directives
- Required resources include:**
- Personnel in required numbers with applicable experience, qualifications and task authorisation
 - Spares
 - Consumables
 - Tools
 - Special equipment
 - Ground support equipment
 - Personal protective equipment (PPE)
- Ground support and test equipment includes:**
- Power carts
 - Hydraulic rigs

- Pneumatic rigs
- Stands and docking
- Component test stands
- Guidance encompasses:**
 - Damage assessment
 - Assessment of repair cost effectiveness
 - Assessment of replacement options
- Applicable documentation, policies and procedures include:**
 - Operating manuals
 - Maintenance manuals
 - Organisational policy manuals
 - Quality manuals
 - Safety manuals
 - Material safety data sheets (MSDS)
 - Procedures manuals
 - Work instructions
 - Defence instructions and standards
 - Standing instructions
- Regulatory requirements are found in:**
 - AAP 7001.053 Technical Airworthiness Management Manual
 - Commonwealth and state/territory work health and safety (WHS) legislation
- Human factors affecting job performance include:**
 - Individual health and disability
 - Social psychology
 - Time pressure and workload
 - The physical work environment
- Actions to minimise maintenance errors include:**
 - Varying the extent of supervision according to the nature of the task and work conditions
 - Allowance for qualification and experience levels within the team
 - Allowance for human error and "Murphy's Law" ('If something can go wrong, it will')
- Sound employment relations includes:**
 - Relevant sections of industrial awards
 - Content of enterprise agreements
 - Conditions of employment and service that that apply to the particular workplace
- On-job training includes:**
 - The reinforcement of knowledge and skills gained in off-job training and guiding their application to specific on-job maintenance tasks

Unit Mapping Information

Release 1 – equivalent to MEA140A Supervise aviation maintenance teams and perform maintenance quality inspections

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA140 Supervise aviation maintenance teams and perform maintenance quality inspections

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- oral communication
- written communication
- planning
- supervision
- inspection
- advanced troubleshooting
- people management
- on-job training delivery
- application of WHS requirements in the workplace.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- principles of supervision
- high level technical knowledge applicable to the job
- fault diagnosis techniques
- maintenance data and documentation
- regulations, policies and procedures relating to supervision and certification of maintenance
- human factors and guidelines
- employment relations and conditions
- equity, diversity and fraud
- Commonwealth and state/territory WHS legislation
- MSDS
- use of PPE
- confined space entry permits
- avoidance of maintenance errors

- MEA Aeroskills Training Package, including relevant units of competency and training pathways
- the Log of Industrial Experience and Achievement, responsibility for making entries and responsibility for the certification of entries
- the role of supervisors in assisting workplace competency assessors
- techniques for delivery of on-job training.
-

Assessment Conditions

- This unit may be assessed on the job, or a combination of both on and off the job. Where partial assessment occurs off the job an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working as a team leader.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

ME A141 Manage risk in aviation maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to the identification of risks and the management of risk in the fields of management of the performance of scheduled and unscheduled maintenance, and in the provision of maintenance support or integrated logistic support (ILS) during maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Identify the criteria for risk management | 1.1 Risk management procedures are identified from the organisation's risk management plan/maintenance organisation exposition |
| | 1.2 Where a risk management plan does not exist, potential risks are identified and documented |
| | 1.3 Criteria for managing the identified risks are determined in accordance with standard risk management procedures and documented as a risk management plan |

- | | | |
|-----|------------------------------------|--|
| | 1.4 | The process for evaluation and review of the risk management plan is identified from the organisation's plan or an evaluation methodology is developed and included in the plan developed in accordance with standard risk management procedures |
| 2. | Manage risk | |
| | 2.1 | Activities are monitored in accordance with the risk management plan |
| | 2.2 | Performance deviations are identified and responses are initiated in accordance with the risk management plan |
| | 2.3 | The effectiveness of risk responses are monitored and reported in accordance with risk management plan procedures |
| 3.1 | Evaluate risk management processes | |
| | 3.1 | Risk management outcomes are reviewed and analysed to assess the effectiveness of the risk management plan |
| | 3.2 | Recommendations on variations to the plan are developed and processed in accordance with organisational policies and procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Risk management plans include:

- Potential risks and their probability of occurrence and degree of severity
- Treatment options in each case
- Responsibility for implementing treatment options and required response times
- Resources required for risk management
- Plan implementation timeframe
- Periodic review timetable
- Internal reporting system

- Potential risks include:**
- Review methodology
 - Human factors, such as fatigue, illness and maintenance errors
 - Work health and safety (WHS) issues resulting in injury or death
 - Regulatory and procedural violations, such as inappropriate use of minimum equipment lists and failure to observe type certification standards
 - Providing maintenance guidance to remotely-located aircrew or maintenance personnel
 - Maintenance difficulties, such as spares shortages and unexpected failures of systems or components
 - Support equipment failure
 - Environmental problems
 - Contractual issues
 - Skill and experience shortfalls
 - Maintenance cost escalation
 - Natural events
- Criteria for managing the identified risks include:**
- Level and degree of acceptability of each identified risk
 - Legal aspects, such as regulatory violations and contractual commitments
 - Cost of managing specific risks versus the cost to the organisation if the risk eventuated
 - Stakeholder perceptions and expectations
- Standard risk management procedures are found in:**
- Organisational risk management policies
 - Websites dealing with risk management
 - Australian and New Zealand Standard AS/NZS 4360 Risk management
 - Civil Aviation Safety Regulation (CASR) Part 145 Manual of Standards
- Evaluation methodology includes:**
- Oversight of day-to-day operations
 - Interviews with personnel in the organisation
 - Physical inspections
 - Incident reports
 - Questionnaires
 - Periodic review of risk treatment procedures and outcomes

Assessment Requirements for MEA141 Manage risk in aviation maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- application of standards and procedures for assessing and evaluating risks
- development of risk treatment processes
- assessment of legal impact of risk occurrence
- evaluation of risk management plan operation
- oral communication
- written communication.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- organisational policies and procedures for risk management
- CASR Part 145 Manual of Standards, in particular Acceptable Means of Compliance and Guidance Material
- maintenance error management programs
- Australian and New Zealand Standard AS/NZS ISO 31000:2009 Risk management
- regulatory impact of risks
- contractual impact of risks
- cost-benefit analysis
- Commonwealth and state/territory WHS and environment protection legislation
- evaluation techniques
- equity, fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered during risk management.

- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA142 Manage self in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to self-management and skills/professional development relating to aviation scheduled and unscheduled maintenance management, including all aspects of aircraft maintenance, aeronautical product maintenance and other related integrated logistic support (ILS) activities. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|----------------|--|
| 1. Manage self | 1.1 Responsibility for own workload is assessed, prioritised and accepted |
| | 1.2 Work is undertaken autonomously to complete tasks/roles in a timely manner and in accordance with organisational and/or legislative and regulatory standards |
| | 1.3 Independence and initiative are demonstrated in identifying and solving problems |
| | 1.4 Initiative is exercised in liaison with colleagues in identifying and analysing alternative approaches to managing workplace issues and problems |

- 1.5 Own performance is evaluated and monitored and confidence is built in own capability, ideas and vision
 - 1.6 Performance feedback from others is used to improve work performance
 - 1.7 Organisational structure, career paths and eligibility criteria are identified
 - 1.8 Awareness is maintained of the effects of fatigue, drugs and alcohol on performance
2. Work effectively with others
 - 2.1 Effective communication is applied when dealing with others through oral communication, including briefings and presentations, and by written communication, including email
 - 2.2 Others are dealt with ethically and principles of diversity applied
 - 2.3 Judgement and discretion are used as is appropriate to the situation
 - 2.4 The trust and confidence of others is developed and maintained at all levels of the organisation
 - 2.5 Others are mentored in specific areas of aviation maintenance and maintenance management and performance feedback is provided
 - 2.6 Advantages, disadvantages and consequences of ideas are identified and considered
 - 2.7 An awareness of the possibility of fraudulent behaviour is maintained
3. Comply with requirements
 - 3.1 Applicable contractual, legislative, regulatory and organisational requirements are complied with
 - 3.2 Work requirements are surveyed and quotes are provided
 - 3.3 Organisation and customer needs are surveyed and assessed
4. Manage work priorities and resources
 - 4.1 Competing demands to achieve objectives and meet requirements for deliverables are prioritised
 - 4.2 Work plans, programs and budgets are prepared, monitored and reviewed

	4.3	Resource use to achieve objectives is planned
	4.4	The nature, extent and impact of any issues or changes relating to work priorities and resource allocation are identified
5. Facilitate and capitalise on change and innovation	5.1	Change is introduced by working closely with others
	5.2	Opportunities for product and service enhancement and options for achieving the desired result are identified
6. Contribute to development of own skills and professional capability	6.1	Units of competency relevant to current employment and career path through managing own skills development are interpreted and applied
	6.2	Problem solving skills are reviewed for further development
	6.3	Own personal knowledge and skills are assessed and learning opportunities are accessed, as required, to fill gaps and enhance skills
	6.4	New ideas and techniques are accepted and time and effort invested in learning new skills
	6.5	Performance feedback is used to identify and develop ways to improve competence

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Tasks/roles include:

- Self-directed application of knowledge and skills in performing tasks related to maintenance management and/or related ILS activities

Organisational and/or legislative and regulatory standards include:

- Equal employment opportunity (EEO) legislation
- Commonwealth and state/territory work health and safety (WHS) legislation

- Civil Aviation Regulations (CARs) and Advisory Circulars (ACs)
- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material
- Maintenance organisation expositions
- Continuing airworthiness management organisation expositions
- Procedures manuals
- Position descriptions
- Quality manuals
- Safety manuals
- Work instructions
- Relevant overseas regulations, such as Federal Aviation Regulations or European Aviation Safety Agency Regulations
- AAP 7001.053 Technical Airworthiness Management Manual
- Defence Regulations and instructions
- Australian Air Publications
- Standing instructions
- Maintenance management plans
- Duty statements
- Man-hours
- Time requirements
- Spares, materials and consumables
- Resources, such as facilities, support equipment and tooling
- Price

Quotations include any or all of:

Unit Mapping Information

Release 1 – equivalent to MEA142B Manage self in the aviation maintenance environment

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA142 Manage self in the aviation maintenance environment

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- oral communication
- written communication
- applying principles of equity and diversity
- managing own work performance
- managing and interfacing with others
- applying legislation, regulations and organisational policies and procedures relevant to role and workplace
- managing own professional development.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS legislation at Commonwealth and state/territory levels
- human factors
- EEO legislation
- privacy legislation
- freedom of information legislation
- equity guidelines
- diversity principles
- detection of fraud
- Australian Qualifications Framework (AQF) and relevant Training Packages
- leadership principles
- management principles and techniques
- regulations, policies, instructions and guidelines relevant to the organisation and role
- problem solving principles
- constant improvement principles and procedures
- change management.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Competency in this unit underpins competency in other aspects of the workplace role of employees with managerial responsibilities in aviation maintenance and related ILS activities. It may be appropriate to assess parts of this unit in conjunction with units relating to the performance of such aspects of the role.

MEA143 Develop and manage maintenance error management programs

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills and knowledge relating to the development and management of maintenance error management programs aimed at reducing human error rates within aviation maintenance organisations (AMOs). It covers all maintenance activities relating to aircraft and aeronautical product that are performed within the jurisdiction of the Civil Aviation Safety Authority (CASA) during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Aeroskills Advanced Diploma training pathways.

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Develop a maintenance error management program | 1.1 The aims and objectives of the maintenance error management program are clearly stated and the program is structured in accordance with regulatory requirements |
| | 1.2 The maintenance error management program encourages open and blame-free (unless negligent) reporting of maintenance errors |
| | 1.3 Disciplinary boundaries are clearly stated for application in the event of negligence |
| | 1.4 A maintenance error investigation procedure is specified, including compliance, where applicable, with |

- regulatory procedures for the reporting of significant safety issues related to maintenance errors
- 1.5 A strategy and procedure is specified for the development and delivery of staff training programs relating to maintenance error management
 - 1.6 Reference to the maintenance error management program is included in applicable organisational policies and procedures
 - 1.7 Provision is made for feedback of program results to the workforce, and for analysis of accumulated data to identify maintenance error trends
2. Manage a maintenance error management program
- 2.1 Reported events are reviewed to determine if they should be investigated within the procedures of the maintenance error management program
 - 2.2 Significant safety issues related to maintenance errors are reported to CASA and/or the Air Transport Safety Bureau (ATSB)
 - 2.3 Events applicable to the maintenance error management program are investigated in accordance with program procedures
 - 2.4 The results of the investigation are analysed to determine appropriate action to minimise the probability of a recurrence of the event
 - 2.5 Necessary action is taken and feedback is provided to the workforce
 - 2.6 The event and resultant action are reviewed to determine what information, if any, should be forwarded to bodies external to the organisation
 - 2.7 Accumulated data is reviewed in accordance with the program procedures to determine and monitor maintenance error trends

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Regulatory requirements and associated guidelines include:

- Civil Aviation Safety Regulations (CASRs), Manuals of Standards and associated Acceptable Means of Compliance and Guidance Material

Regulatory procedures for the reporting of significant safety issues include:

- Major defect report (MDR)
- Service difficulty report (SDR)
- Confidential aviation incident report (CAIR)

Applicable organisational policies and procedures include:

- Maintenance organisation expositions
- Quality manuals
- Safety manuals
- Procedures manuals
- Work instructions

Unit Mapping Information

Release 1 – equivalent to MEA143B Develop and manage maintenance error management programs

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA143 Develop and manage maintenance error management programs

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- written and oral communication
- use of regulations and advisory material to set up a maintenance error management program
- specification of training requirements
- application of human factors
- application of trend analysis to maintenance data.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- relevant regulations and advisory material
- human factors
- investigative processes
- trend analysis
- how to specify training requirements
- equity, fraud and ethics.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered during maintenance error management.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.

- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA145 Conversion from allied trades for employment in aviation maintenance workshops

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of common core skills and knowledge that are aviation maintenance specific and meet the requirements of the two Regulators, the Civil Aviation Safety Authority (CASA) and the Australian Defence Force (ADF). The skills and knowledge will be applied during the maintenance of items of aeronautical product in aviation maintenance workshops.

The unit is applicable to individuals with Certificate III or Certificate IV qualifications in allied trades (primarily automotive, electrotechnology or metals and engineering) who are to be employed in aviation maintenance workshops. It covers aviation maintenance-specific parts of common core competencies that must be applied by all individuals employed on the maintenance of items of aeronautical product and which would not have been covered in allied trade units that relate to similar areas of expertise.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the ADF and CASA.

This unit applies to MEA Skill Sets and must not be included in any AQF qualification.

Pre-requisite Unit

MEA108 Complete aviation maintenance industry documentation

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1. Identify and access aviation industry manuals, specifications and drawings	1.1 Appropriate manuals are identified and accessed for the type of aircraft or component to be maintained 1.2 Amendment status is clearly established to ensure the correct specifications and procedures are applied
2. Amend manuals, specifications or drawings	2.1 Manual, specification or drawing changes and/or amendments are incorporated and documented correctly in accordance with statutory regulations and/or enterprise procedures
3. Store manuals, specifications or drawings	3.1 Manuals, specifications or drawings are stored appropriately to ensure prevention of damage, ready access and updating of information, when required, in accordance with regulatory and/or enterprise procedures
4. Apply standard trade practices	4.1 Common types of aircraft attachment hardware are correctly selected and used 4.2 Common types of safety locking devices and fasteners are correctly selected and used 4.3 Aircraft components, devices and hardware are lockwired in the correct manner, using the appropriate wire gauge 4.4 Common types of aircraft connectors and plumbing are accurately assembled or connected
5. Interpret and apply quality standards in the aviation maintenance environment	5.1 Standards or specifications set out in maintenance documents and process specifications are identified and interpreted 5.2 Enterprise quality requirements are identified, confirmed and applied
6. Plan steps and organise work to complete task	6.1 Steps are planned in conjunction with the work of other personnel to allow achievement of practical outcomes in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices

- 6.2 Human factors and work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS), are allowed for in planning of steps
- 6.3 Work activity is organised with other involved personnel, allowing for relevant human factors and using relevant communication processes to ensure safe and appropriate sequencing of tasks
- 6.4 All necessary documentation related to job planning and progress is completed and recorded in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

<p>Appropriate manuals include:</p>	<ul style="list-style-type: none"> • Aircraft publications, maintenance instruction manuals, process specifications, servicing or service bulletins or structural repair manuals • Tooling or equipment manuals, manufacturer's manuals, standard practices, enterprise aviation regulations and publications • Illustrated parts catalogues, aircraft wiring manuals or drawings
<p>Application of standard aviation trade practices includes:</p>	<ul style="list-style-type: none"> • The selection and use of hand and power tools and equipment associated with workshop-related activities in the aircraft maintenance environment that involve: <ul style="list-style-type: none"> • laying out and fabricating simple items from common aircraft materials • assembling items using a representative range of common types of aircraft attachment hardware for which relevant fits and clearances, appropriate safety locking devices and fasteners, including lockwire, are correctly selected and applied

	<ul style="list-style-type: none"> • assembling/connecting a range of common aircraft connectors and plumbing, applying safety locking devices, where applicable • assembling/connecting aircraft control cables and applying safety locking devices, where applicable
Regulatory and enterprise procedures are found in:	<ul style="list-style-type: none"> • Civil Aviation Regulations (CARs) or Civil Aviation Safety Regulations (CASRs) • Maintenance organisation manual • Procedures manuals • Work instructions • Quality manuals • Safety manuals • Applicable Defence Regulations and instructions • Standing instructions
Human factors include:	<ul style="list-style-type: none"> • The factors relating to human behaviour and performance in aviation maintenance environments that are defined by either CASA or the ADF
Documentation includes:	<ul style="list-style-type: none"> • Maintenance logs, overhaul test/check sheets, job history sheets, traveller cards, maintenance reports, irregularity reports, serviceable tags or removal tags • MSDS or material record sheets

Unit Mapping Information

Release 1 – equivalent to MEA145A Conversion from allied trades for employment in aviation maintenance workshops

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA145 Conversion from allied trades for employment in aviation maintenance workshops

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- accessing, interpreting and applying information from industry manuals, including paper-based, microfiche or computer-based media, relating to work activities, including determination of manual amendment status, knowledge of manual structures and locating relevant information/instructions for work activity
- amending industry manuals to reflect current/approved amendment status
- identifying and interpreting information from drawings and diagrams in aircraft maintenance manuals, including component scaling, section, assembly, location, drawing applicability and amendment status from the title block
- correct handling and storage of drawings, manuals and industry media, i.e. microfiche and digital formats
- determining correct lubricants for specified applications
- identifying common ferrous and non-ferrous aircraft materials
- identifying common aircraft composite and non-metallic materials (other than wood)
- identifying aircraft hardware by markings, part numbers, size, shape and material
- installing aircraft hardware using standard practices/techniques to ensure safe security and includes:
 - minimum thread engagement
 - split pinning
 - lockwiring
 - application of locking compounds
 - locking tabs and spring washers
 - lock nuts
- installing aircraft hardware using tightening, torquing and tensioning techniques
- identifying various types of aircraft rigid and flexible plumbing and their connectors
- identifying aircraft control cables and related cable system hardware
- applying workplace hazard reporting and identification procedures
- being able to differentiate the elements which constitute the quality system and the ability to identify processes, workplace regulations and ISO 9000 compliant documentation and specifications within the workplace environment

- interpreting information relating to the work activity from a range of industry manuals, industry and enterprise regulations and industry documentation
- considering WHS regulations/precautions specific to the work activity and others working in the vicinity of the planned work activity, particularly with regard to electricity, gases (especially oxygen), oils and chemicals
- using MSDS
- applying human factors in planning maintenance activities.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the types of industry manuals used in aviation maintenance and types of media
- requirements for custody and upkeep of industry manuals
- techniques for obtaining and applying data contained in industry manuals
- types of standard aircraft hardware and methods of identification, including bolts, nuts, washers, pins (cotter and tapered), and fasteners (rivets and camlocs)
- materials from which hardware is manufactured and its applications, including plain, corrosion resistant and temperature/heat resistant
- types of safety locking devices and their application
- common ferrous and non-ferrous aircraft materials, heat treatment and testing
- characteristics and properties of common composite and non-metallic materials (other than wood)
- types of aircraft cable, turnbuckles, end fittings, tensiometers, pulleys and cable system components, and aircraft flexible control systems
- types and characteristics of lubricants
- typical quality systems and their operation in the workplace
- workplace quality documentation, such as quality manuals, procedures manuals, work instructions and worksheets
- the relationship between the quality system and WHS requirements, such as workplace hazard reporting
- the relationship between the quality system and identification systems for aircraft hardware, materials and components
- the impact of human factors on the safe and effective performance of maintenance on aircraft and aircraft components
- MSDS.

Assessment Conditions

- Competency should be assessed in the work environment, or by use of simulated activities, covering the use of publications/maintenance regulations/orders and standards and practices, the application of aviation maintenance specific standard trade practices, and of task planning and quality system application in the aeronautical product maintenance environment.

- This unit must be linked in its assessment and application to those that apply to the actual maintenance of items of aeronautical product. It is essential that all WHS requirements are met and understood.
- The transferability of general manual interpretation and use in accordance with relevant aircraft component publications/maintenance regulations/orders and standards and practices must be clearly established. This includes evidence of underlying knowledge and skills associated with the interpretation and use of manuals to supplement understanding of the structure and regulatory requirements associated with the aircraft maintenance environment for aeronautical product maintenance.
- Evidence of knowledge about how aircraft materials, standard items of hardware and fittings are used in component maintenance and the application of quality systems and work planning must be demonstrated. The ability to apply the skills and knowledge across a variety of applications must also be demonstrated.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance of the unit of competency are being achieved under routine supervision on at least one manual from each of:
 - aircraft publications, maintenance instruction manuals, process specifications, servicing or service bulletins or structural repair manuals
 - tooling or equipment manuals, manufacturer's manuals, standard practices, enterprise aviation regulations and publications
 - illustrated parts catalogues, aircraft wiring manuals or drawings
- and on representative tasks from:
 - laying out and fabricating simple items from common aircraft materials
 - assembling items using a representative range of common types of aircraft attachment hardware for which relevant fits and clearances, appropriate safety locking devices and fasteners, including lockwire, are correctly selected and applied
 - assembling/connecting a range of common aircraft connectors and plumbing, applying safety locking devices, where applicable
 - assembling/connecting aircraft control cables and applying safety locking devices, where applicable.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).

MEA146 Prepare and manage aviation maintenance organisation budgets and financial plans

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of procedures for the development and management of budgets and financial plans required to enable the effective operation of an Aviation Maintenance Organisation (AMO) within the bounds of its exposition and to effectively interface with professional finance advisers and accountants.

Applications include the financial management obligations of Accountable Managers of AMOs operating under the Australian Defence Force (ADF) or the Civil Aviation Safety Authority (CASA) regulatory systems.

The unit is part of the Advanced Diploma training pathways.

Pre-requisite Unit

Competency Field

Aviation maintenance management

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Analyse strategic opportunities and intended maintenance activities | 1.1 Strategic opportunities are expressed in terms of aircraft and aeronautical product maintenance activities |
| | 1.2 All intended maintenance activities are converted into special projects or work programs |
| | 1.3 Financial trends are analysed and interpreted in the context of the organisational strategic objectives |

- 1.4 Financial planning objectives, process timeframes and resources are clearly identified
- 2. Develop revenue, expenditure and capital investment proposals
 - 2.1 Individuals and groups are given responsibility for the development of specific budgets and plans
 - 2.2 Consultation occurs with all relevant groups and individuals throughout the organisation
 - 2.3 Proposals are developed taking account of past experience, present trends and future expectations
 - 2.4 Outcomes of proposals are clearly linked to organisational strategic objectives
 - 2.5 Realistic cost-benefit and Maintenance Organisation Exposition compliance costs are incorporated into all proposals
 - 2.6 Organisational investment target rates are met for capital expenditure proposals
 - 2.7 Performance measures and tactics for monitoring and control processes are identified for each proposal/action and a financial risk management plan is developed
 - 2.8 Proposals comply with the organisation's values, policies, code of conduct, legal and ethical obligations
 - 2.9 Proposals are developed within the agreed timeframes
 - 2.10 Supporting evidence is valid and sufficient to allow proper evaluation of the proposals
- 3. Build agreement for budgets and financial plans
 - 3.1 Negotiation is undertaken with relevant groups and individuals in ways that build commitment to the plans
 - 3.2 Links to the achievement of organisational strategic objectives are identified and agreed
 - 3.3 Outcomes are confirmed in terms of clear, concise objectives and timeframes
 - 3.4 Negotiations lead to a clear agreement of those matters to be incorporated into budgets and plans
 - 3.5 Budgets and plans incorporate the outcomes of negotiations and meet the organisation's approval processes

- 3.6 Delegations, accountabilities and responsibilities are agreed and confirmed in writing
- 3.7 Final budget and plans are clearly documented and a communication plan developed
- 4. Communicate budget and financial plans
 - 4.1 Budget/financial plan communication package is reviewed by finance specialists
 - 4.2 Package is amended/revised where appropriate
 - 4.3 Training activities are undertaken with users of the budget and plans across the organisation
 - 4.4 All data and terms are defined and understood by the users of the plans
 - 4.5 Communication outcomes are tested to ensure clear understanding of objectives, processes and accountabilities
- 5. Monitor and control activities against plans
 - 5.1 Delegations and budget accountabilities are confirmed in writing prior to budget period
 - 5.2 Funds are allocated in accordance with budget objectives and parameters
 - 5.3 Recording systems and documentation meet all audit requirements and legal obligations
 - 5.4 Risk management plans are implemented and contingency plans put in place for all financial plans
 - 5.5 Performance is monitored and variances promptly identified
 - 5.6 Variances are analysed in conjunction with relevant experts to determine cause and effect
 - 5.7 Remedial action is taken swiftly to minimise negative impact and maximise benefits
 - 5.8 Budgets and plans are renegotiated/restructured, where necessary, to optimise organisational performance
- 6. Report outcomes of financial plans
 - 6.1 Records of financial performance are properly maintained within organisational systems
 - 6.2 Financial performance is analysed and reported in a form

and language appropriate to the audience

6.3 Non-financial objectives are reported in the context of overall organisational performance

6.4 Strategies and plans are reviewed and updated to optimise organisational performance

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Legislation, codes and national standards relevant to the workplace include:

- Civil Aviation Safety Regulations (CASRs) and associated Manuals of Standards
- AAP 7001.053 Technical Airworthiness Management Manual
- Award and enterprise agreements and relevant industrial instruments
- Relevant legislation from all levels of government that affects business operation, especially in regard to work health and safety (WHS), environmental and sustainability issues, equal employment opportunity (EEO) and anti-discrimination

Strategic opportunities include:

- Aircraft operators and fleet operators seeking to outsource maintenance
- Aeronautical product maintenance needs
- Changing regulatory requirements for maintenance
- New aircraft types
- Provision of logistic support services
- Opportunity to respond to requests for tender to provide aircraft and/or aeronautical product maintenance
- Opportunity to accept sub-contract maintenance tasks from other maintenance organisations

Budgets and plans include:

- Aircraft maintenance budgets
- Aeronautical product maintenance budgets

- Financial budgets
 - Logistic services sales budgets
 - Regulatory compliance budgets
 - Capital expenditure budgets
 - Cash flow plans
- Relevant groups and individuals include:**
- All personnel within the organisation affected by the budgets and financial plans being developed
- Investment target rates include:**
- The minimum percentage rate of return required by the organisation for a capital investment project to proceed
- Capital expenditure includes:**
- Those components of the budget which, for internal policy reasons, are considered to provide benefits over more than one financial period and are to be evaluated as capital expenditure projects
- Legal and ethical obligations include:**
- Compliance with all relevant statutes, regulations and audit requirements of the organisation, along with the organisation's policies, values and codes of conduct
- Supporting evidence includes:**
- Cost-benefit analyses
 - Risk management plans
 - Market research results
 - Tender details
 - Net present value
 - Interest rate of return
 - Pay pack calculations
- Delegations**
- Delegations refer to the decision-making accountabilities relating to the person's position description and/or other written and verbal delegations
- Accountabilities and responsibilities include:**
- Clarification of who is to be accountable for a decision or action prior to its execution, and identification of groups, individuals and activities for which a person is responsible for managing
- Training activities include:**
- Small group discussions
 - Informal meetings
 - Formal, structured competency-based training
 - Television and video conferencing
 - E-learning
- Delegations and budget accountabilities include:**
- Monitoring expenditure
 - Authorising expenditure within limits
 - Reporting on variances to budget/plan
 - Taking remedial action within budget authority
- Audit requirements include:**
- The internal standards required in the management of budgets and financial plans, approved by external/internal auditors

Risk management includes: • The process of identification of potential negative events and the development of plans to mitigate or minimise the likelihood of the negative event occurring and/or the consequences in the event it does occur

Appropriate non-financial objectives include:

- Environmental
- Sustainability
- Compliance with Maintenance Organisation Exposition (CASA regulatory system)
- Compliance with Maintenance Management Plan (ADF regulatory system)
- Compliance with requirements of the applicable airworthiness regulator
- WHS
- Quality and safety management
- Market share
- Customer service
- Security or any other key result area

Unit Mapping Information

Release 1 – equivalent to MEA146A Prepare and manage aviation maintenance organisation budgets and financial plans

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA146 Prepare and manage aviation maintenance organisation budgets and financial plans

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- analysis and interpretation of relevant financial information
- development of formal estimates of reviews, costs, cash flows and logistic requirements
- communication/consultation to ensure all relevant groups and individuals are advised of what is occurring and are provided with an opportunity for input
- cost and benefit analysis to produce balanced arguments to support financial proposals
- risk management to assess probability and consequences of any potential negative event
- investment analysis to evaluate capital expenditure proposals net present value (NPV), incentive rate of return (IROR), etc)
- negotiating agreement on budgets and financial plans with the relevant managers
- relating to people from a range of social, cultural and ethnic backgrounds and physical and mental abilities
- arranging and delivering training to ensure team members and other managers understand the budget/financial planning objectives and processes
- analysing and interpreting positive and negative variances from budget/plan, determining the reasons therefore, and identifying potential actions to remediate the situation
- developing and implementing systems to ensure financial performance records are collected, maintained and properly reported.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- relevant legislation from all levels of government that affects business operation, especially in regard to WHS and environmental issues, equal employment opportunity (EEO), industrial relations and anti-discrimination
- requirements in Civil Aviation Safety Regulations (CASRs) and AAP 7001.053 Technical Airworthiness Management Manual regarding financial status of maintenance organisations
- aircraft and aeronautical product maintenance and maintenance management/certification requirements

- financial planning within the organisation
- budgeting
- organisation's intended aircraft and aeronautical product maintenance activities
- consultative methods and processes
- capital investment evaluation techniques
- performance measurement
- organisation roles in respect to financial delegations, accountabilities and responsibilities
- standards for organisational record keeping and audit requirements.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is, the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations encountered during the management of organisational budgets and financial plans.
- The candidate must have access to all materials and documentation required and must be permitted to refer to any relevant workplace procedures, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

ME A147 Perform airworthiness management and maintenance program tasks

Modification History

Release 1 - New unit of competency

Application

This unit of competency deals specifically with skills and knowledge required for employment within Civil Aviation Safety Regulation (CASR) Part 42 Continuing Airworthiness Management Organisations (CAMOs) on airworthiness review and maintenance program approval tasks associated with scheduled and unscheduled maintenance.

Work will typically be performed as a staff member of a CAMO as defined in the Part 42 Manual of Standards and in the associated Acceptable Means of Compliance and Guidance Material.

Pre-requisite Unit

ME A137 Write aviation technical publications

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---------------------------------------|---|
| 1. Perform airworthiness review tasks | 1.1 Level of authorisation to perform airworthiness review tasks is determined |
| | 1.2 Continuing airworthiness records for the aircraft under review are obtained |

- 1.3 Airworthiness status of the aircraft is determined
 - 1.4 The aircraft is surveyed for compliance with regulations and with the aircraft's approved type design
 - 1.5 The completion of any required corrective action is verified
 - 1.6 A record of the review is written in accordance with CAMO procedures
 - 1.7 The airworthiness review certificate is raised and issued in accordance with CAMO procedures, or, where applicable, a notice of decision not to issue an airworthiness review certificate is raised and issued
2. Perform maintenance program approval tasks
- 2.1 Level of authorisation to perform maintenance program approval tasks is determined
 - 2.2 Maintenance programs are developed in accordance with applicable regulations and CAMO procedures
 - 2.3 Variations to approved maintenance programs are developed in accordance with applicable regulations and CAMO procedures
 - 2.4 Maintenance schedules are developed in accordance with CAMO procedures for inclusion in the maintenance program
 - 2.5 A schedule of life-limited parts is developed in accordance with CAMO procedures for each maintenance program
 - 2.6 Maintenance program approval documentation is raised and processed in accordance with regulatory requirements and CAMO procedures
 - 2.7 Maintenance program variation approval documentation is raised and processed in accordance with regulatory requirements and CAMO procedures
 - 2.8 One-off extensions to maintenance task intervals are processed in accordance with CAMO procedures
 - 2.9 Maintenance program approval records are raised and maintained in accordance with CAMO procedures
3. Perform reliability
- 3.1 The requirement for a reliability program is determined

program tasks

- 3.2 The reliability program is developed and written in accordance with CAMO procedures
- 3.3 Responsibilities for reliability program administration are determined and recorded in the program
- 3.4 Reliability data sources are identified and data collection, recording, and analysis procedures and responsibilities are specified in the program details
- 3.5 Performance standards are determined and recorded in the program details along with a process for regular review
- 3.6 Procedures are developed for investigation when performance standards are exceeded and for the implementation and recording of corrective action
- 3.7 Operation of the reliability program is monitored to ensure program effectiveness

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

CAMO authorisations

- CAMO authorisations may be found in the CAMO Exposition

Regulatory requirements, standards and advisory material relating to continuing airworthiness management are found in:

- Civil Aviation Safety Regulations (CASRs)
- CASR Part 42 Manual of Standards
- CASR Part 42 Guidance Material and Acceptable Means of Compliance
- Users Guide CASR Part 42
- CAAP 42M-2(0) Reliability Programs
- FAA AC 20-157 How to prepare Reliability Assessment Plans for Aircraft Systems and Equipment

- FAR Part 23 Airworthiness Standards for Airplanes in the Normal, Utility, Aerobatic or Commuter Categories
- FAR Part 25 Airworthiness Standards for Airplanes in the Transport Category
- EASA CS-23 Certification Specifications for Aeroplanes in the Normal, Utility, Aerobatic or Commuter Categories
- EASA CS-25 Certification Specifications for Airplanes in the Transport Category
- AC 21-15 (1) Supplemental Type Certificates

Unit Mapping Information

Release 1 – equivalent to MEA147A Perform airworthiness management and maintenance program tasks

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA147 Perform airworthiness management and maintenance program tasks

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- communicating in English both verbally and in writing with CAMO staff, aircraft operators, aircraft type certificate holder and regulatory staff
- writing and applying airworthiness review procedures
- determining aircraft airworthiness status and surveying aircraft for compliance with requirements
- raising and processing airworthiness review certificates
- developing and drafting maintenance programs
- revising maintenance programs
- maintaining maintenance program data
- obtaining and maintaining maintenance program approval
- setting up and operating a reliability program.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- continuing airworthiness management regulatory requirements
- the CAMO Exposition and individual appointments and responsibilities
- aircraft design and design approval regulations
- aircraft type certificates and Maintenance Review Boards
- Airworthiness Directives (ADs)
- manufacturer's maintenance data and flight manual
- aircraft weight and balance
- maintenance program development and review procedures
- reliability program design
- data analysis methods and data presentation.

Assessment Conditions

- This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, that is the candidate is not in productive work, then an appropriate simulation must be used where the range of conditions reflects realistic workplace situations. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements and performance criteria of the unit of competency, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- The candidate must have access to all tools, equipment, materials and documentation required. The candidate must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. The preferred method is the records in the Maintenance Management Competency Log. Where the individual does not have a Competency Log evidence can be gathered through a variety of ways, including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- This unit could be assessed in conjunction with any other units addressing the safety, quality, communication, materials handling, recording and reporting associated with applying scientific principles and techniques in aeronautical engineering situations or other units requiring the exercise of the skills and knowledge covered by this unit.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA148 Apply mathematics and physics in aviation maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of mathematics and physics principles required to support the development and application of aircraft, aircraft system and component maintenance competencies.

It also complies with the requirements of the licensing syllabus in the Civil Aviation Safety Regulation (CASR) Part 66 Manual of Standards.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes

Performance criteria describe the performance needed to demonstrate achievement of the element

- | | | | |
|----|---|-----|---|
| 1. | Apply mathematical techniques in aviation maintenance | 1.1 | Arithmetic is used in calculations relating to aviation maintenance |
| | | 1.2 | Basic algebra is used to solve problems relating to aviation maintenance |
| | | 1.3 | Binary and other applicable numbering systems are used in aviation maintenance applications |
| | | 1.4 | Simple geometric constructions are used in aviation maintenance settings |
| | | 1.5 | Graphical representations are used in aviation maintenance settings |

- | | | | |
|----|---|--|---|
| | 1.6 | Simple trigonometric principles and methods are applied in aviation maintenance settings | |
| 2. | Apply physics laws and principles in aviation maintenance | 2.1 | Statics principles and techniques are applied in aviation maintenance settings |
| | | 2.2 | Kinetics principles and techniques are applied in aviation maintenance settings |
| | | 2.3 | Dynamics principles and techniques are applied in aviation maintenance settings |
| | | 2.4 | Fluid dynamics principles and techniques are applied in aviation maintenance settings |
| | | 2.5 | Thermodynamics principles, laws and techniques are applied in aviation maintenance settings |
| | | 2.6 | Typical applications of light characteristics and laws in aviation maintenance settings are explained |
| | | 2.7 | The application of the principles of wave motion and sound in aviation maintenance settings are explained |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Unit Mapping Information

New unit of competency

Assessment Requirements for MEA148 Apply mathematics and physics in aviation maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment on at least one occasion, and must include:

- performing arithmetical calculations typically required in aviation maintenance that apply the methods listed in knowledge evidence
- applying physics principles, laws and techniques listed in knowledge evidence that are applicable to aircraft and aircraft systems.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- arithmetic:
 - terms and signs
 - methods of multiplication and division
 - fractions and decimals
 - factors and multiples
 - weights, measures and conversion factors
 - ratio and proportion
 - averages
 - percentages
 - areas and volumes
 - squares, cubes, square and cube roots
- algebra:
 - how to evaluate simple algebraic expressions (add, subtract, multiply, divide, brackets, and simple fractions)
 - linear equations and their solution
 - indices and powers, negative and fractional indices
 - simultaneous equations and second degree equations with one unknown
- binary and other applicable numbering systems
- logarithms
- geometry:

- simple geometrical constructions
- graphical representation (nature and use, graphs of equations and functions)
- trigonometry:
 - simple trigonometry
 - trigonometrical relationships
 - use of tables
 - rectangular and polar coordinates
- matter:
 - nature of matter (chemical elements, atoms and molecules)
 - chemical compounds
 - states and change between states
- mechanics:
 - forces, moments and couples – representation as vectors
 - centre of gravity
 - elements of theory of stress, strain and elasticity (tension, compression, shear and torsion)
 - nature and properties of solid, fluid and gas
 - pressure and buoyancy in liquids (barometers)
 - linear movement – uniform motion in a straight line, motion under constant acceleration including motion under gravity – Newton’s Laws of Motion
 - rotational motion – uniform circular motion – centrifugal and centripetal forces
 - periodic motion – pendular movement
 - simple theory of vibration, harmonics and resonance
 - velocity ratio, mechanical advantage and efficiency
 - mass
 - force, inertia, work, power, energy (potential, kinetic and total), heat and efficiency
 - momentum and conservation of momentum
 - impulse
 - gyroscopic principles
 - friction – nature and effects and coefficient of friction
 - specific gravity and density
 - viscosity, fluid resistance and effects of streamlining
 - effects of compressibility of fluids
 - static, dynamic and total pressure, Bernoulli’s Theorem and venturi
- thermodynamics:
 - temperature – thermometers and temperature scales (Celsius, Fahrenheit and Kelvin), heat definition
 - heat capacity and specific heat
 - heat transfer – convection, radiation and conduction
 - volumetric expansion

- first and second laws of thermodynamics
- gases – ideal gas laws, specific heat at constant volume and constant pressure, work done by expanding gas
- isothermal, adiabatic expansion and compression, engine cycles, constant volume and constant pressure, refrigerators and heat pumps
- latent heat of fusion and evaporation, thermal energy and heat of combustion
- optics:
 - nature of light and speed of light
 - laws of reflection and refraction – reflection at plane surfaces, reflection by spherical mirrors, refraction and lenses
 - fibre optics
- wave motion and sound:
 - wave motion – mechanical waves, sinusoidal wave motion, interference phenomena and standing waves
 - sound – speed of sound, production of sound, intensity, pitch and quality, and Doppler effect.

Assessment Conditions

- The unit may be assessed off the job in a training classroom environment using problems and application of knowledge relevant to aviation maintenance competencies and relevant knowledge requirements.
- The unit must be linked in its assessment and application to those units that apply to actual maintenance of aircraft.
- Evidence of knowledge about aviation maintenance settings in which mathematical techniques and physics principles, laws and techniques are applied is essential.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and the performance criteria of the unit of competency are being achieved off the job in simulated settings.

MEA201 Remove and install miscellaneous aircraft electrical hardware/components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills in basic soldering and in crimping associated with the removal and installation of miscellaneous electrical hardware and components fitted to fixed or rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of all Avionic Certificate IV training pathways and is also part of the Mechanical Aircraft Maintenance Engineer licensing pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activities
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Remove aircraft electrical hardware | 1.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety |
| | 1.2 Removal of electrical hardware is carried out in accordance with the applicable maintenance manual observing all relevant work health and safety (WHS) requirements |
| | 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| | 1.4 Removed components are tagged, packaged or discarded in accordance with specified procedures |
| 2. Install aircraft electrical hardware | 2.1 Electrical hardware components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life |
| | 2.2 Physical installation of electrical hardware is carried out in accordance with the applicable maintenance manual |
| | 2.3 System is reinstated to correct physical condition in preparation for testing, as necessary |
| | 2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Hardware connection methods include:

- Bolted
- Soldered
- Plug connectors

Types of electrical hardware include:

- Switches, relays, lamps, terminal blocks, current limiters, circuit breakers, fuses, sockets, potentiometers, capacitors, inductors, magnetic amplifiers, transformers, rheostats, resistors and diodes, miscellaneous sensors and minor components hard mounted throughout the aircraft, busbars, lugs, ferrules, splices, connectors and electrical, electronic cables and looms

Basic soldering and crimping

- The work will include the application of basic soldering and crimping skills associated with removal and installation of electrical hardware.

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA201B Remove and install miscellaneous aircraft electrical hardware/components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA201 Remove and install miscellaneous aircraft electrical hardware/components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- the preparation and termination of electrical cables to aircraft industry standards, using crimping techniques, soldering techniques and solder sleeves joints
- the correct interpretation of aircraft wire markings, terminal block identification and plug/socket pin numbering systems
- inspection of electrical looms and harness pre and post-removal and installation to ensure minimum bends are maintained, cable is not in tension, plugs are correctly aligned, security of route ensures no chaffing of insulation, adequate clipping and cable ties have been utilised and construction complies with aircraft industry standards
- positive identification of miscellaneous electrical hardware and/or components in all aircraft systems.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- application of relevant WHS practices
- the use of approved maintenance documentation and aircraft publications relating to miscellaneous aircraft electrical hardware and components
- electrical wiring used in aircraft and wire marking
- plug/socket pin numbering and terminal block identification
- cable and loom installation requirements
- crimping tools and crimp terminals
- soldering techniques and the use of solder sleeve joints
- electrical fundamentals.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine maintenance situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware and system operation as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- It is essential that applicable cleanliness requirements and WHS safety precautions are fully observed, including awareness of electrostatic discharge procedures.
- Evidence of transferability of skills and knowledge related to removal and installation is essential.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria are being achieved under routine supervision on each of the connection methods:
 - bolted
 - soldered
 - plug connectors.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Implementation Guide).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA202 Remove and install basic aircraft electrical system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the removal and installation of aircraft direct current (DC) electrical system components of fixed and rotary wing aircraft that have only DC electrical systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA201 Remove and install miscellaneous aircraft electrical hardware/components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Remove DC aircraft electrical system components
 - 1.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
 - 1.2 Electrical component removal is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements
 - 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 1.4 Removed components are tagged and packaged in accordance with specified procedures
2. Install DC aircraft electrical system components
 - 2.1 Electrical components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
 - 2.2 Physical installation of electrical components is performed in accordance with the applicable maintenance manual, ensuring appropriate adjustment/alignment with mechanical interface is carried out
 - 2.3 System is reinstated to correct operational condition in preparation for testing, as necessary
 - 2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Electrical systems and components include:

- DC generators, and alternator/rectifier generators, and components of related single generator regulation and distribution systems
- Motors
- Actuators
- Piston engine ignition and starting system components
- Aircraft batteries
- Specific components of DC electrical systems, such as flaps and landing gear
- Aircraft lighting
- Gas turbine engine igniter and starting systems

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA202C Remove and install basic aircraft electrical system components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA202 Remove and install basic aircraft electrical system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- identifying/locating:
 - DC power generation, regulation, distribution and control systems and components, i.e. regulators and bus bars
 - piston engine ignition systems and components, i.e. coils, magnetos, auxiliary starting devices (impulse couplings and inductors/vibrators)
 - gas turbine engine igniter and starting system components (where applicable to enterprise)
 - batteries (lead acid and nickel cadmium) and associated mounting equipment, including related anti-vibration aids
 - motors and actuators in basic DC electrical systems
 - specific components of DC electrical systems, such as flaps and landing gear
- correctly connecting DC generators and alternator/rectifier generators
- applying relevant WHS practices.

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across a range of aircraft major electrical system components encompassing electrical with mechanical interface, installations which require alignment and/or adjustment (mechanical or electrical).

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- relevant WHS practices

- the use of approved maintenance documentation and aircraft publications relating to DC electrical systems
- properties of permanent magnets
- precautions for the care and storage of permanent magnets
- general construction, operating characteristics and applications for:
 - aircraft DC generators
 - alternator/rectifier DC generators
 - DC starter/generators
 - DC motors, including starter motors
 - DC rotary and linear actuators
 - batteries
- how to locate and identify components of:
 - DC power regulation and distribution systems
 - piston engine ignition and starting systems
 - gas turbine engine igniter systems, including specific WHS precautions
 - gas turbine engine starting systems
 - DC electrical systems, such as flaps and landing gear retraction
 - lighting systems
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine maintenance situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware, and the need for adjustment or rigging and system operation as they relate to the work must be demonstrated before undertaking any action.
- The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and the performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) component from each of:
 - DC generators, and alternator/rectifier generators, and components of related single generator regulation and distribution systems
 - motors
 - actuators
 - piston engine ignition and starting system components

- aircraft batteries
- specific components of DC electrical systems, such as flaps, landing gear
- aircraft lighting
- gas turbine engine igniter and starting systems (may be omitted when not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards
- Individuals being assessed who have already attained MEA274 Maintain basic light aircraft electrical systems and components will have satisfied the requirements of this unit with regard to common range of conditions variables. The Log of Industrial Experience and Achievement records relating to MEA274 Maintain basic light aircraft electrical systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

MEA203 Remove and install advanced aircraft electrical system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the removal and installation of advanced aircraft electrical alternating current (AC) and direct current (DC) system components of fixed and rotary wing aircraft that have both AC and DC electrical systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway, and of the Mechanical Aircraft Maintenance Engineer licensing pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional

contexts) are included.

Electrical system components include:

- DC and AC power generation and distribution system components, including generators and related multi-sourced DC power generation, starter generators alternators and regulation, and control and distribution system components
- Transformer rectifier units and/or inverters
- Batteries and related bus tie or interlock system components and battery temperature monitoring systems
- Motors and actuators
- Components of gas turbine and/or piston engine ignition and starting systems (where applicable to the enterprise)
- External/internal lights
- Electrical components of specific electrical systems, such as air cycle air conditioning, combustion heaters, equipment cooling, anti-icing and de-icing, landing gear, anti-skid, flight control, master and central warning, fuel storage and distribution, fire warning and extinguishing, and engine/propeller control (where applicable to the enterprise)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA203 Remove and install advanced aircraft electrical system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- identifying/locating:
 - DC power regulation, distribution and control systems and components, i.e. regulators and bus bars
 - AC power regulation, distribution and control systems and components, i.e. generator control units
 - various types of inverters and transformer rectifier units
 - gas turbine and piston engine ignition and starting systems and components (where applicable to the enterprise)
 - batteries (lead acid and nickel cadmium) and associated mounting equipment including related anti-vibration aids and battery temperature monitoring systems
 - flight control servo actuating devices, i.e. AC and DC electro-mechanical, electro-pneumatic, electro-hydraulic, duplex servomotors, power control units and trim control devices
 - electrical components of aircraft systems, such as air cycle air conditioning, anti-icing and de-icing, landing gear, anti-skid, flight control, master and central warning, fuel storage and distribution, external and internal lighting, fire warning and extinguishing, and engine/propeller control (where applicable to the enterprise)
- correctly connecting:
 - DC generators
 - star or delta alternators to star and delta loads
 - starter generators
 - AC motors
 - polyphase motors
- applying relevant WHS practices.

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across a range of aircraft major electrical system components encompassing electrical with mechanical interface and installations that require alignment and/or adjustment (mechanical or electrical).

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- relevant WHS practices
- the use of approved maintenance documentation and aircraft publications relating to AC and DC electrical systems
- properties of permanent magnets
- precautions for the care and storage of permanent magnets
- bonding of aircraft components and lightning protection
- general construction, operating characteristics and applications for aircraft:
 - generators
 - alternators
 - AC and DC motors
 - transformer rectifier units
 - rotary and static inverters
 - batteries
 - linear and rotary actuators
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures
- environmental protection requirements relating to Halon fire extinguishers (e.g. Bromochlorodifluoromethane (BCF)).

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine maintenance situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware, and the need for adjustment or rigging and system operation as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor, that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) component from:
 - DC and AC power generation and distribution system components, including generators and related multi-sourced DC power generation, starter generators alternators and regulation, and control and distribution system components
 - transformer rectifier units and/or inverters
 - batteries and related bus tie or interlock system components and battery temperature monitoring systems
 - motors and actuators
 - components of gas turbine and/or piston engine ignition and starting systems (may be omitted where not applicable to the enterprise)
 - external/internal lights
- and on three (3) components that are applicable to the enterprise from:
 - electrical components of specific electrical systems, such as air cycle air conditioning, combustion heaters, equipment cooling, anti-icing and de-icing, landing gear, anti-skid, flight control, master and central warning, fuel storage and distribution, fire warning and extinguishing and engine/propeller control.
- This shall be established via records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA202 Remove and install basic aircraft electrical system components will have covered a significant amount of the skill and knowledge requirements for this unit plus part of the Performance Criteria for Elements 1 and 2 and associated range of conditions items. The Log of Industrial Experience and Achievement records relating to MEA202 Remove and install basic aircraft electrical system components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.
- Guidance information in MEA202 Remove and install basic aircraft electrical system components regarding MEA274 Maintain basic light aircraft electrical systems and components should also be taken into consideration and the attainment of MEA277 Maintain twin engine aircraft electrical systems and components would significantly increase the extent of coverage of range of conditions variables. The Log of Experience and Achievement records relating to MEA274 Maintain basic light aircraft electrical systems and components and MEA277 Maintain twin engine aircraft electrical systems and components may also be accepted as meeting the evidence requirements for this unit in the applicable areas.

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Instrument components include:

- Pitot/static system components, airspeed indicators (ASIs), vertical speed indicators (VSIs) and counter pointer altimeters
- Directional gyros (DGs) and artificial horizons (AHs), both air and electrically driven
- Turn and bank and slip/turn coordinators
- Direct reading compasses
- Remote reading gyro compasses (where applicable to the enterprise)
- Piston engine indication system components (direct reading measuring instruments and temperature indication)
- Gas turbine engine indication system components (where applicable to the enterprise)
- Outside air temperature gauges (OAT)
- Electrical systems indication (voltage, current, power and frequency)
- Basic fuel quantity indication system components
- Pneumatic/vacuum indication system components
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Assessment Requirements for MEA204 Remove and install basic aircraft instrument system components

Modification History

Release 2 - Remote reading gyro compasses and gas turbine engine indication system components added to Assessment Requirements

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- locating and identifying flight instrument system components comprising:
 - piston engine system temperature, pressure, speed (including mechanical and electrical tachometers), manifold pressure/boost (including aneroid type, syphon bellows and dual compartment type)
 - gas turbine engine indicating system temperature, pressure, speed, torque, fuel flow and vibration (may be omitted if not relevant to the enterprise)
 - auxiliary direct reading systems, including hydraulic pressure, pneumatic pressure and vacuum, and fuel storage quantities
 - flight systems, including attitude, altitude, air speed and OAT
- locating and identifying direct reading compasses
- locating and identifying remote reading gyro compass system components (may be omitted if not relevant to enterprise)
- correct handling and observance of maintenance precautions relating to gyroscopes, gimbals, pitot/static systems (connections, heating and protrusions)
- applying relevant WHS practices.

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across a range of aircraft instrument system components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods

- connection of hardware and plugs
- handling precautions relating to:
 - electrostatic sensitive devices
 - gyroscopes and gimbals
- basic instrument system and component operating principles:
 - atmospheric and barometry
 - terminology and unit of measurement conversion
 - aircraft instrumentation requirements
 - instrument panel layout
 - pressure sensing elements
 - pitot static systems and testing requirements
 - gyroscopic principles
 - direct reading compasses
 - remote reading gyro compasses
 - temperature sensors
 - fluid quantity indication systems
- general layout and components of the following systems:
 - flight systems, including:
 - altitude (direct reading altimeters)
 - attitude, including directional gyros and artificial horizons (both air and electrically driven), turn and slip and turn coordinator
 - airspeed
 - OAT
 - remote reading gyro compass system
 - piston engine indication systems, including:
 - direct reading temperature
 - direct reading pressure (e.g. oil pressure)
 - speed, including mechanical and electric tachometers
 - manifold pressure/boost, including aneroid, syphon bellows and dual compartment types
 - gas turbine engine indication systems, including:
 - temperature and pressure
 - speed, including mechanical and electric tachometers
 - torque
 - fuel flow
 - vibration
 - auxiliary direct reading systems, including:
 - electrical
 - hydraulic pressure
 - pneumatic pressure and vacuum

- basic fuel quantity indication
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine maintenance situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware, and the need for adjustment or calibration and system operation as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) component from each of:
 - pitot/static system components, ASIs, VSIs and counter pointer altimeters
 - DGs and AHs, both air and electrically driven
 - turn and bank and slip/turn coordinators
 - remote reading gyro compass system (may be omitted if not relevant to the enterprise)
 - direct reading compasses
 - piston engine indication system components (direct reading measuring instruments and temperature indication)
 - gas turbine engine indication system components (may be omitted if not relevant to the enterprise)
 - electrical systems indication (voltage, current, power and frequency)
 - basic fuel quantity indication system components
 - pneumatic/vacuum indication system components.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

- Individuals being assessed who have already attained MEA275 Maintain basic light aircraft instrument systems and components will have met all of the criteria for this unit. The Log of Industrial Experience and Achievement records relating to MEA275 Maintain basic light aircraft instrument systems and components may be accepted as also meeting the evidence requirements for this unit.

MEA205 Remove and install advanced aircraft instrument system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the removal and installation of components of advanced instrument systems of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway. It covers the skills and knowledge required for the removal and installation of general instrument system components in the more advanced types of both fixed and rotary wing aircraft.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA201 Remove and install miscellaneous aircraft electrical hardware/components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Remove advanced aircraft instrument system components | 1.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety |
| | 1.2 Instrument component removal is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| | 1.4 Removed components are tagged and packaged in accordance with specified procedures |
| 2. Install advanced aircraft instrument system components | 2.1 Instrument components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life |
| | 2.2 Physical installation of instrument components is performed in accordance with the applicable maintenance manual and regulatory requirements, ensuring appropriate adjustment/alignment is carried out |
| | 2.3 System is reinstated to correct operational condition in preparation for testing, as necessary |
| | 2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Instrument components include:

- Pitot/static system components, airspeed indicators (ASIs), vertical speed indicators (VSIs), air data system components, machmeters, altimeters including servo and encoding altimeters, outside air temperature gauge (OAT) angle of attack and stall warning/avoidance systems
- Turn and slip, directional gyros (DGs), artificial horizons (AHs), attitude and heading reference system (AHRS) components (where applicable to enterprise), remote reading gyro compass system components and direct reading compasses
- Turbine engine indication systems
- Transmitter/indicator measuring instrument systems (pressure, temperature and position)
- Fuel quantity indication and flow systems components
- Ground proximity warning system (GPWS) (where applicable to the enterprise)
- Flight data recorder (FDR) (where applicable to the enterprise)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Assessment Requirements for MEA205 Remove and install advanced aircraft instrument system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- locating and identifying flight instrument system components comprising:
 - engine system temperature, pressure (including thermocouples, sensor units and transmitters), speed (including mechanical and electrical tachometers), thrust (fan, propeller and jet), torque, fuel flow and vibration
 - auxiliary systems, including hydraulic pressure and temperature, transmission pressure and temperature, fuel storage quantities, fuel remaining/used, component position, i.e. flaps, landing gear, speed brakes and door/pylon locking
 - flight systems, including attitude, altitude, air speed, OAT and GPWS (where applicable to the enterprise)
- locating and identifying direct reading compasses, remote compass system components (flux valve, gyro, amplifier and indicator), and AHRS components
- locating and identifying FDR system components (where applicable to the enterprise)
- correct handling procedures and maintenance precautions relating to gyroscopes, gimbals, pitot/static systems (connections, heating and protrusions)
- applying relevant WHS practices.

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across a range of aircraft instrument system components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- handling precautions for electrostatic sensitive devices

- relevant WHS practices
- the use of approved maintenance documentation and aircraft publications relating to basic and advanced instrument systems
- basic instrument system and component operating principles:
 - atmospheric and barometry
 - terminology and unit of measurement conversion
 - aircraft instrumentation requirements
 - instrument panel layout
 - pressure sensing elements
 - pitot static systems and testing requirements
 - gyroscopic principles
 - direct reading compasses
 - temperature sensors
 - fluid quantity indication systems
- general layout and components of the following systems:
 - flight systems, including:
 - altitude (direct reading, servo and encoding altimeters)
 - attitude, including DG and AH (both air and electrically driven) and turn and slip, and AHRS
 - airspeed, including ASI, machmeters and air data systems
 - VSI
 - angle of attack and stall warning/avoidance
 - OAT
 - GPWS
 - engine indication systems, including:
 - temperature and pressure, including thermocouples, sensors and transmitters
 - speed, including mechanical and electric tachometers
 - thrust, including fan, propeller and jet
 - torque
 - fuel flow
 - vibration
 - auxiliary transmitter/indicator measuring systems, including:
 - hydraulic pressure and temperature
 - pneumatic pressure
 - transmission oil pressure and temperature
 - fuel remaining/used
 - fuel quantity indication
 - component position
- remote compass systems
- FDR systems

- application of relevant WHS practices.
-

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine maintenance situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware, and the need for adjustment or calibration and system operation as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) component from each of:
 - pitot/static system components, ASIs, VSIs, air data system components, machmeters, altimeters, including servo and encoding altimeters, angle of attack and stall warning/avoidance systems
 - turn and slip, DGs, AHs, AHRS components (where applicable to enterprise), remote reading gyro compass system components and direct reading compasses
 - turbine engine indication systems
 - transmitter/indicator measuring instrument systems (pressure, temperature, position)
 - fuel quantity indication and flow systems components
 - GPWS (may be omitted where not applicable to the enterprise)
 - FDR (may be omitted where not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA204 Remove and install basic aircraft instrument system components or MEA275 Maintain basic light aircraft instrument systems and components will have covered a significant amount of the skill and knowledge requirements for this unit plus part of the performance criteria for Elements 1 and 2 and associated range statement items. The Log of Industrial Experience and Achievement records relating to MEA204 Remove and install basic aircraft instrument system components or MEA275 Maintain basic light aircraft instrument systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

MEA206 Remove and install aircraft basic radio communication and navigation system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the removal and installation of basic radio communication and navigation system components of fixed and rotary wing aircraft that have basic radio communication and navigation systems, during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA201 Remove and install miscellaneous aircraft electrical hardware/components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.

demonstrate achievement of the element.

1. Remove basic radio communication and navigation system components

1.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety

1.2 Communication and navigation system component removal is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements

1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

1.4 Removed components are tagged and packaged in accordance with specified procedures

2. Install basic radio communication and navigation system components

2.1 Communication and navigation system components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life

2.2 Physical installation of components is performed in accordance with the applicable maintenance manual and regulatory requirements, ensuring appropriate adjustment/alignment is carried out

2.3 System is reinstated to correct operational condition in preparation for testing, as necessary

2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Communication and navigation system components include:

- High frequency (HF) and very high frequency (VHF) communication and applicable antennas
- Automatic direction finding (ADF) and very high frequency omni-directional range (VOR) navigation and applicable antennas
- Emergency location transmitter (ELT)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA206 Remove and install aircraft basic radio communication and navigation system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- locating and identifying radio communication and navigation system components comprising:
 - HF and VHF communications
 - VOR and ADF navigation systems
 - ELT systems
- locating and identifying applicable radio system antennas
- removing and installing communication and navigation system components including antennas
- applying relevant WHS practices.

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across a range of radio communication and navigation system components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- handling precautions for electrostatic sensitive devices
- relevant WHS practices
- the use of approved maintenance documentation and aircraft publications relating to radio communication and navigation systems and components
- basic layout and working principles to block diagram level of:

- HF communication systems
- VHF communication systems
- ADF navigation systems
- VOR navigation systems
- ELT systems
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine maintenance situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware, and the need for adjustment or calibration and system operation as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of:
 - HF and VHF communication and applicable antennas
 - ADF and VOR navigation and applicable antennas
 - ELT.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).must satisfy National Vocational Education and Training Regulator (NVR)/Australian Quality Training Framework (AQTF) assessor requirements.
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

- Individuals being assessed who have already attained MEA207 Remove and install aircraft electronic system components will have covered a significant amount of the skill and knowledge requirements for this unit plus part of the performance criteria for Elements 1 and 2 and associated range of conditions items. Those who have attained MEA276 Maintain basic light aircraft communication and radio navigation systems and components, or MEA289A Maintain basic light aircraft avionic systems and components, will have fully covered the requirements for this unit in common variables in the Range of Conditions. The Log of Industrial Experience and Achievement records relating to MEA207 Remove and install aircraft electronic system components, MEA276 Maintain basic light aircraft communication and radio navigation systems and components and MEA289A Maintain basic light aircraft avionic systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

MEA207 Remove and install aircraft electronic system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the removal and installation of electronic system components and line replaceable units (LRUs) of fixed and rotary wing aircraft that are fitted with electronic systems, during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Assessment Requirements for MEA207 Remove and install aircraft electronic system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- locating and identifying electronic navigational system components, including altitude reporting systems (transponder, encoder and control unit), remote attitude displays and Inertial Navigation and Reference Systems
- locating and identifying multi-function electronic displays, including electronic flight instrument system (EFIS), engine indicating and crew alerting system (EICAS), electronic central aircraft monitor system (ECAM), flight management computer system (FMCS) and head-up display (HUD)
- locating and identifying radio communication and navigation system components comprising ultra-high frequency (UHF); satellite communications (SATCOM); distance measuring equipment (DME); instrument landing system (ILS); global navigation system (GNS); radio navigation; traffic collision avoidance system (TCAS); radio altimeter (RADALT); and radio system antennas, including half dipole, slotted, loop and marconi
- locating and identifying primary and secondary radar system components, including transmission lines, waveguide and antennas
- locating and identifying cockpit voice recorder system components, internal communications and passenger/cockpit audio/visual components
- applying relevant WHS practices.

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of components and plugs
- printed circuit boards
- panel and rack mounting systems for electronic system components and LRUs
- relevant WHS practices

- the use of approved maintenance documentation and aircraft publications relating to the avionics systems and components being maintained
- handling and maintenance precautions relating to gyroscopes, gimbals, electronic displays, airborne radar systems (including pressurised waveguides), electrostatic sensitive devices and radio installations
- electromagnetic environment
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware, and the need for adjustment or calibration and system operation as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across a range of electronic system components as listed in the range of conditions.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on sufficient components/LRUs of systems (at least five (5) including their antennas) to establish competency, as follows:
 - instrument navigation systems
 - communication systems
 - radio navigation systems
 - pulse operated systems
 - antennas
 - electronic instrument displays (may be omitted where not applicable to the enterprise)
 - automatic flight control systems (may be omitted where not applicable to the enterprise)
 - cabin entertainment equipment (may be omitted where not applicable to the enterprise)
 - on-board maintenance systems (may be omitted where not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA206 Remove and install aircraft basic radio communication and navigation system components will have covered a significant amount of the skill and knowledge requirements for this unit plus part of the performance criteria for Elements 1 and 2 and associated range of conditions items. The Log of Industrial Experience and Achievement records relating to MEA206 Remove and install aircraft basic radio communication and navigation system components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

Assessment Requirements for MEA208 Remove and install aircraft pressurisation control system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the pressurisation control system and components being maintained
- locating and identifying the components of pressurisation control systems
- removing and installing pressurisation control system components.

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of components and plugs
- relevant WHS practices
- the layout and operation to block diagram level of mechanical and electronic pressurisation control systems
- handling precautions relating to electrostatic sensitive devices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.

- An understanding of the attachment methods, connection of hardware, and the need for confirming correct system operation must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- Evidence of transferability of skills and knowledge related to removal and installation is essential.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of components of a specific aircraft type pressurisation control system.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

ME A209 Remove and install aircraft oxygen system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the removal and installation of aircraft oxygen system components of fixed or rotary wing aircraft that have oxygen systems, during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway and is also part of the Mechanical Aircraft Maintenance Engineer licensing pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

ME A101	Interpret work health and safety practices in aviation maintenance
ME A103	Plan and organise aviation maintenance work activity
ME A105	Apply quality standards applicable to aviation maintenance processes
ME A107	Interpret and use aviation maintenance industry manuals and specifications
ME A108	Complete aviation maintenance industry documentation
ME A109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Remove oxygen system components | 1.1 Oxygen system is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety |
| | 1.2 Removal of oxygen system components is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| | 1.4 Removed components are tagged, packaged or discarded in accordance with specified procedures |
| 2. Install aircraft oxygen system components | 2.1 Oxygen system components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life |
| | 2.2 Oxygen system components to be installed are free from contamination and inspected for damaged flair ends and fittings |
| | 2.3 Component installation is physically carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements |
| | 2.4 System is reinstated to correct physical condition in preparation for testing, as necessary |
| | 2.5 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Oxygen system components include:**
- Oxygen pressure cylinders, valves and gauges
 - Regulators, masks (including other integrated systems), pipes, hoses and fittings
 - Chemical generators (where applicable to the enterprise)
 - Liquid dry breathing oxygen (LDBO) converters (where applicable to the enterprise)
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA209C Remove and install aircraft oxygen system components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA209 Remove and install aircraft oxygen system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying appropriate WHS practices and using approved maintenance documentation and aircraft publications relating to aircraft oxygen systems and components
- demonstrating the procedure to replenish a dry breathing oxygen system, including:
 - correct identification of oxygen ground trolleys
 - maximum charging pressures for low and high pressure systems
 - safety precautions to be adhered to during replenishment
 - correct order of procedural replenishment steps
- demonstrating the procedure to purge a dry breathing oxygen system, including:
 - reasons for the requirement to undertake a purging operation
 - identification of acceptable system purging gases
 - safety precautions to be adhered to during purging
- employing correct techniques when purging oxygen storage cylinders or systems.

It is essential that oxygen system cleanliness requirements and safety precautions applicable to system component handling are fully observed, understood and complied with. These cleanliness requirements extend to all tooling and hardware associated with oxygen system maintenance.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across a range of aircraft oxygen system components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS practices relevant to oxygen system maintenance
- component attachment methods
- connection of hardware and couplings
- oxygen system isolation

- the properties of aircraft oxygen and requirements for aircrew/passengers
- the layout of low and high-pressure dry breathing oxygen systems and components
- the methods by which gaseous dry breathing oxygen is stored in both the aircraft and within the workplace environment. Reference to storage trolleys, aircraft cylinders and chemical oxygen cylinders is required
- the methods used to locate, identify and access oxygen system components for removal and installation
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is expected that dedicated tools, test and ground support equipment is used in routine oxygen situations.
- An understanding of the attachment methods, connection hardware, and the need for adjustment or rigging and system operation as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of:
 - oxygen pressure cylinders, valves and gauges
 - regulators, masks (including other integrated systems), pipes, hoses and fittings
 - chemical generators (may be omitted where they are not applicable to the enterprise)
 - LDBO converters (may be omitted where they are not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable test equipment to inspect, test and troubleshoot direct current (DC) aircraft electrical systems and components of fixed and rotary wing aircraft that have only DC electrical systems, during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA202 Remove and install basic aircraft electrical system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Inspect DC aircraft electrical systems and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 DC electrical system is visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust DC aircraft electrical systems | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Electrical system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot DC aircraft electrical systems | 3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 System faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required and in accordance with standard enterprise procedures |

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

DC electrical systems/components include:

- DC generators and alternator/rectifier generators, and components of related single generator regulation and distribution systems
- Piston engine ignition and starting system components
- Specific components of DC electrical systems, such as flaps and landing gear, including related motors and actuators
- Gas turbine engine igniter and starting systems and components (where applicable to the enterprise)
- Aircraft lighting
- Aircraft main batteries

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA210C Inspect, test and troubleshoot basic aircraft electrical systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in:
 - DC power generation systems, including regulation, distribution and control
 - battery installations
 - piston engine ignition and starting systems and components:
 - magnetos or coils
 - starter motors
 - ignition switches/start switches
 - ignition harnesses
 - low tension wiring
 - spark plugs
 - auxiliary starting devices
 - gas turbine engine ignition and starting systems (where applicable to the enterprise):
 - starter motors and starter/generators
 - high energy ignition units
 - control units
 - switches
 - batteries and associated mounting equipment, including related anti-vibration aids
 - motors and actuators in DC electrical systems
 - internal/external lighting systems, including controls
 - flap systems
 - landing gear systems
- applying logic processes, taking and interpreting electrical measurements, and using test equipment and appropriate wiring diagrams and manuals to isolate malfunctions in the above systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability

- applying relevant WHS practices, including those relating to gas turbine engine high energy ignition units.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of aircraft electrical systems and components listed in the Range of Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- DC circuit theory
- electrical system maintenance requirements and troubleshooting procedures
- the basic layout (block diagram level), function and operation of:
 - single generator DC power generation and distribution systems and components, including:
 - DC generators
 - alternator/rectifier generators
 - starter/generators
 - voltage regulators
 - circuit protection devices
 - bus bars
 - piston engine ignition and starting systems and components, including:
 - magnetos or coils
 - starter motors
 - ignition switches/start switches
 - ignition harnesses
 - low tension wiring
 - spark plugs
 - auxiliary starting devices
 - gas turbine igniter and starting systems and components, including specific WHS precautions:
 - starter motors and starter/generators
 - high energy ignition units
 - control units
 - switches
 - landing gear and flap systems and components, including:

- motors
- actuators
- selector switches
- micro switches
- internal and external lighting systems and components
- batteries and associated mounting equipment, including related anti-vibration aids
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that general and special purpose tools, test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on electrical looms, cables and connection hardware, and on each system in the range of conditions and on at least one (1) major component/line replaceable unit (LRU) in each case, as follows:
 - DC generators and alternator/rectifier generators, and components of related single generator regulation and distribution systems
 - piston engine ignition and starting system components
 - specific components of DC electrical systems, such as flaps and landing gear, including related motors and actuators
 - gas turbine engine igniter and starting systems and components (may be omitted if not applicable to the enterprise)
 - aircraft lighting
 - aircraft main batteries (competency may be demonstrated through the performance of a battery check).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA274 Maintain basic light aircraft electrical systems and components will have satisfied the requirements of this unit with regard to common range of conditions variables. The Log of Industrial Experience and Achievement records relating to MEA274 Maintain basic light aircraft electrical systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot advanced aircraft electrical systems and components of fixed and rotary wing aircraft that have advanced electrical systems, during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway and is also part of the Mechanical Aircraft Maintenance Engineer licensing pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

- | | |
|--------|---|
| MEA203 | Remove and install advanced aircraft electrical system components |
| MEA246 | Fabricate and/or repair aircraft electrical components or parts |

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect advanced aircraft electrical systems and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 Electrical systems are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust advanced aircraft electrical systems | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Electrical system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot advanced aircraft electrical systems | 3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 System faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures |

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Electrical systems and their components include:**
- Direct current (DC) and alternating current (AC) power generation and distribution systems and components, including generators, alternators, starter generators and related control, regulation and distribution system components
 - Transformer rectifier units and inverters
 - Batteries and related bus tie or interlock system components and battery temperature monitoring systems
 - Motors and actuators
 - Components of gas turbine and/or piston engine ignition and starting systems (where applicable to the enterprise)
 - External/internal lights
 - Electrical components specific to systems, such as air cycle air conditioning, combustion heating, equipment cooling, anti-icing and de-icing, landing gear, anti-skid, flight control, master and central warning, fuel storage and distribution, fire warning and extinguishing and engine/propeller control
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in:
 - DC and AC power generation systems, including regulation, distribution and control
 - inverters (rotary and static)
 - battery installations, including temperature monitoring systems
 - gas turbine and piston engine ignition and starting systems (where applicable to the enterprise)
 - propeller systems
 - internal/external lighting systems, including controls
 - landing gear systems, including anti-skid
 - flight controls
 - fire warning and extinguishing
 - air cycle air conditioning and combustion heating systems
 - equipment cooling and ventilation
 - fuel storage and distribution
 - master and central warning
- applying logic processes, taking and interpreting electrical measurements, using test equipment and appropriate wiring diagrams and manuals to isolate electrical system malfunctions in the above systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- applying WHS requirements applicable to the maintenance of aircraft electrical systems
- using approved maintenance documentation and aircraft publications relating to the electrical systems being maintained.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the basic layout (block diagram level), function and operation of the following systems:
- DC and AC power multi-generator systems, including regulation, distribution and control
- inverters (rotary and static)
- battery installations, including temperature monitoring systems
- gas turbine and piston engine ignition and starting systems
- propeller systems
- internal/external lighting systems, including controls
- landing gear systems, including anti-skid
- flight controls
- fire warning and extinguishing
- air cycle air conditioning and combustion heating systems
- equipment cooling and ventilation
- fuel storage and distribution
- master and central warning
- explaining basic principles/functions, relating to the above systems and associated with:
 - basic DC and AC circuit theory
 - DC generator characteristics
 - alternator characteristics
 - starter generator characteristics
 - DC and AC motors
 - rotary and static inverter operation
- WHS requirements applicable to the maintenance of aircraft electrical systems, including gas turbine engine high energy ignition units
- electrical system maintenance requirements and troubleshooting procedures
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that general and special purpose tools, and test and ground support equipment would be used where appropriate.

- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements of and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one (1) item from each of:
 - DC and AC power generation and distribution systems and components, including generators, alternators, starter generators and related control, regulation and distribution system components
 - transformer rectifier units and inverters
 - batteries and related bus tie or interlock system components and battery temperature monitoring systems
 - motors and actuators
 - components of gas turbine and/or piston engine ignition and starting systems (may be omitted if not applicable to the enterprise)
 - external/internal lights
 - electrical components specific to systems, such as air cycle air conditioning, combustion heating, equipment cooling, anti-icing and de-icing, landing gear, anti-skid, flight control, master and central warning, fuel storage and distribution, fire warning and extinguishing and engine/propeller control.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components will have covered inspection, testing and troubleshooting of DC power generation and DC systems and components. The Log of Industrial Experience and Achievement records relating to MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.
- Advice in MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components regarding the coverage provided by MEA274 Maintain basic light aircraft electrical systems and components should also be taken into consideration if the individual has attained that unit rather than MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components.

MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components

Modification History

Release 2 – Remote reading gyro compasses and gas turbine engine indication system added to Range of Conditions

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable test equipment to inspect, test and troubleshoot basic aircraft instrument systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

- | | |
|--------|---|
| MEA204 | Remove and install basic aircraft instrument system components |
| MEA246 | Fabricate and/or repair aircraft electrical components or parts |

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect aircraft basic instrument systems and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 Instrument system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust aircraft basic instrument systems and components | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Instrument system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot aircraft basic instrument systems and components | 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 Instrument system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in |

accordance with standard enterprise procedures

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Instrument systems and components include:

- Pitot/static systems and components, airspeed indicators (ASIs), vertical speed indicators (VSIs), outside air temperature gauges (OAT) and counter-pointer altimeters
- Directional gyros (DGs) and artificial horizons (AHs) (air and electrically driven)
- Turn and bank and slip/turn coordinators
- Direct reading compasses
- Remote reading gyro compass systems (where applicable to the enterprise)
- Piston engine indication system components (direct reading measuring instruments and temperature indication)
- Gas turbine engine indication system components (where applicable to the enterprise)
- Electrical systems indication (voltage, current, power and frequency)
- Basic fuel quantity indication systems and components
- Pneumatic/vacuum indication components
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 2 – remote reading gyro compasses and gas turbine engine indication system added to Range of Conditions and Assessment Requirements. No change in outcome

Release 1 – equivalent to MEA212C Inspect, test and troubleshoot basic aircraft instrument systems and components

Assessment Requirements for MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components

Modification History

Release 2 – Remote reading gyro compasses and gas turbine engine indication system added to Assessment Requirements

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in:
 - flight instruments
 - pitot/static systems
 - direct reading compasses
 - remote reading gyro compass systems (may be omitted if not relevant to the enterprise)
 - piston engine indication systems
 - gas turbine engine indication systems (may be omitted if not relevant to the enterprise)
 - electrical systems indication
 - basic fuel quantity indication systems
 - pneumatic/vacuum indication systems
- applying logic processes, taking and interpreting system measurements, using test equipment and appropriate wiring diagrams and manuals to isolate instrument system malfunctions in the above systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- applying WHS requirements relevant to instrument system maintenance.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the instrument system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of basic aircraft instrument systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the basic layout (block diagram level), function and operation of:
 - flight systems, including:
 - altitude (direct reading altimeters)
 - attitude including DGs and AHs (both air and electrically driven), turn and slip and turn coordinator
 - airspeed
 - OAT
 - remote reading gyro compass systems
 - piston engine indication systems, including:
 - direct reading temperature
 - direct reading pressure (e.g. oil pressure)
 - speed, including mechanical and electric tachometers
 - manifold pressure/boost, including aneroid, syphon bellows and dual compartment types
 - gas turbine engine indication systems, including:
 - temperature and pressure
 - speed, including mechanical and electric tachometers
 - torque
 - fuel flow
 - vibration
 - auxiliary direct reading systems, including:
 - electrical
 - hydraulic pressure
 - pneumatic pressure and vacuum
 - basic fuel quantity indication
- basic instrument system maintenance and testing requirements, and troubleshooting procedures
- WHS requirements relevant to instrument system maintenance
- the operating principles of the above systems and associated with:
 - atmospheric conditions; properties and effects on aircraft instruments and systems
 - pressure and temperature sensing elements and their use in aircraft instruments
 - gyroscopes and their use in aircraft instrument systems
 - electrical fundamentals
- direct reading compass installations and calibration
- calibration of remote reading gyro compass systems
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one (1) major system component/line replaceable unit (LRU) from each of:
 - pitot/static systems and components, ASIs, VSIs, OAT, and counter-pointer altimeters
 - DGs and AHs (air and electrically driven)
 - turn and bank and slip/turn coordinators
 - direct reading compasses
 - remote reading gyro compass system components (may be omitted if not relevant to the organisation)
 - piston engine indication system components (direct reading measuring instruments and temperature indication)
 - gas turbine engine indication system components (may be omitted if not relevant to the organisation)
 - electrical systems indication (voltage, current, power and frequency)
 - basic fuel quantity indication systems and components
 - pneumatic/vacuum indication components.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA275 Maintain basic light aircraft instrument systems and components will have satisfied the requirements of this unit with regard to common range of conditions variables. The Log of Industrial Experience and Achievement records relating to MEA275 Maintain basic light aircraft instrument systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot aircraft advanced instrument systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA205 Remove and install advanced aircraft instrument system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect aircraft advanced instrument systems and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 Instrument system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust aircraft advanced instrument systems and components | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Instrument system is functionally tested, in accordance with maintenance manual, for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot aircraft advanced instrument systems | 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 Instrument system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures |

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Instrument systems and components include:

- Pitot/static system components; airspeed indicators (ASIs); vertical speed indicators (VSIs); air data systems and components; machmeters; altimeters, including servo and encoding altimeters; angle of attack and stall warning/avoidance systems
- Turn and slip indicators, directional gyros (DGs), artificial horizons (AHs), attitude and heading reference systems (AHRS) and components, remote reading gyro compass systems and components and direct reading compasses
- Turbine engine indication systems and components (tachometers, pressure, temperature, engine performance and engine vibration)
- Transmitter/indicator measuring instrument systems (pressure, temperature and position)
- Fuel quantity indication and flow systems and components
- Ground proximity warning system (GPWS) (where applicable to the enterprise)
- Flight data recorders (FDRs) (where applicable to the enterprise)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA213C Inspect, test and troubleshoot advanced aircraft instrument systems

Assessment Requirements for MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in:
 - flight instruments
 - pitot/static systems
 - navigation systems – compasses and AHRS
 - GPWS (where applicable to the enterprise)
 - FDRs (where applicable to the enterprise)
 - position indicators, engine/auxiliary system indication systems and system components
- applying logic processes, taking and interpreting system measurements, and using test equipment and appropriate wiring diagrams and manuals to isolate instrument and display system malfunctions in the listed systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the instrument and display systems being maintained.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the instrument system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of advanced aircraft instrument systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware
- instrument system maintenance requirements and testing and troubleshooting procedures
- the basic layout (block diagram level), function and operation of:
 - flight instruments, including:
 - ASIs
 - VSIs
 - air data systems and components
 - machmeters
 - altimeters including servo and encoding altimeters
 - turn and slip indicators
 - AHs
 - DGs
 - angle of attack and stall warning/avoidance systems
 - pitot/static systems
 - navigation systems:
 - direct reading compasses
 - gyro compasses
 - AHRS
 - GPWS
 - turbine engine instruments, including:
 - temperature and pressure, including thermocouples, sensors and transmitters
 - speed, including mechanical and electric tachometers
 - thrust, including fan, propeller and jet
 - torque
 - fuel flow
 - vibration
 - auxiliary transmitter/indicator measuring systems, including:
 - hydraulic pressure and temperature
 - pneumatic pressure
 - transmission oil pressure and temperature
 - fuel remaining/used
 - fuel quantity indication
 - component position (e.g. doors, flaps, speed brakes and landing gear)
 - FDR systems
- explaining the operating principles of the above-listed systems and associated with:

- atmospheric conditions; properties and effects on aircraft instruments and systems
- pressure and temperature sensing elements and their use in aircraft instruments
- gyroscopes and their use in aircraft instrument and reference systems
- explaining the various methods of navigation, and describing how they are used by both aircraft conventional and electronic navigational instruments and systems
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least (1) one major system component/line replacement unit (LRU) from each of:
 - pitot/static system components; ASIs; VSIs; air data systems and components; machmeters; altimeters, including servo and encoding altimeters; angle of attack and stall warning/avoidance systems
 - turn and slip indicators, DGs, AHs, AHRS and components, remote reading gyro compass systems and components, and direct reading compasses
 - turbine engine indication systems and components (tachometers, pressure, temperature, engine performance and engine vibration)
 - transmitter/indicator measuring instrument systems (pressure, temperature and position)
 - fuel quantity indication and flow systems and components
 - GPWS (may be omitted if not applicable to the enterprise)
 - FDRs (may be omitted if not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

- Individuals being assessed who have already attained MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components will have covered inspection, testing and troubleshooting of a range of flight instruments and direct reading compass and measuring systems. The Log of Industrial Experience and Achievement records relating to MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.
- Advice provided in MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components regarding MEA275 Maintain basic light aircraft systems and components should also be considered where applicable.

MEA214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot basic communication and radio navigation systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA206 Remove and install basic radio communication and navigation system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Inspect basic communication and radio navigation systems and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 Communication and radio navigation systems and components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust basic communication and radio navigation systems and components | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Communication and radio navigation systems are functionally tested, in accordance with maintenance manual, for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot basic communication and radio navigation systems | 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |

| | 3.3 Specialist advice is obtained, where required, to assist |

with the troubleshooting process

- 3.4 Communication and radio navigation system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard operating procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Communication and radio navigation systems and components include:

- High frequency (HF), very high frequency (VHF)
- Automatic direction finding (ADF), very high frequency omni-directional range (VOR)
- Emergency location transmitter (ELT)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the radio frequency and communications system being maintained
- recognising system and component defects/external damage, correct installation, attaching hardware (including cabling/harnesses/transmission lines) and security in:
 - HF and VHF communications systems
 - VOR and ADF navigation systems
 - ELT systems
- applying logic processes, taking and interpreting system measurements to accurately and effectively isolate malfunctions within the above systems
- testing listed systems to isolate system faults and assess post maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the communication or radio navigation system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of basic aircraft communication and radio navigation systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- the basic layout (block diagram level), function and operation of:

- HF and VHF communications systems
- VOR and ADF navigation systems
- ELT systems
- communication and radio frequency navigation system maintenance requirements and troubleshooting procedures
- relevant WHS practices
- basic principles/functions, relating to the above systems and associated with:
 - electromagnetic radiation and propagation
 - basic AC and DC circuit theory
 - printed circuit boards
 - digital fundamentals
 - analogue fundamentals
 - transmitter and receiver principles
 - antenna characteristics
 - transmission line characteristics
 - fibre optic communications
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one (1) major system component/line replaceable unit (LRU) from each of:
 - HF and VHF communications systems
 - ADF and VOR navigation systems
 - ELT systems.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).

- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have attained MEA276 Maintain basic aircraft communication and radio navigation systems and components or MEA289 Maintain basic aircraft communication and radio navigation systems and components will have partially met the skill and knowledge requirements and elements/performance criteria for this unit. The Log of Industrial Experience and Achievement records relating to MEA276 Maintain basic aircraft communication and radio navigation systems and components and MEA289 Maintain basic aircraft communication and radio navigation systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

Elements and Performance Criteria

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1. Inspect advanced communications systems and components	1.1 Relevant maintenance documentation and modification status, including system defect reports where relevant, are used to identify specific inspection requirements
	1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual
	1.3 Communications system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements
	1.4 Defects are correctly identified and reported
2. Test/adjust advanced communications systems and components	2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
	2.2 Communications system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction
	2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate
3. Troubleshoot advanced communications systems	3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination
	3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level
	3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
	3.4 Communications system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Communications systems and components include:

- Ultra-high frequency (UHF) and satellite communications (SATCOM)
- Intercommunication and cockpit voice recorder (CVR) systems

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA215C Inspect, test and troubleshoot advanced aircraft communications systems and components

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA215 Inspect, test and troubleshoot advanced aircraft communications systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures
- using approved maintenance documentation and aircraft publications relating to the communications system being maintained
- recognition of system and component defects/external damage, correct installation, attaching hardware (including cabling/harnesses/transmission lines) and security in:
 - external communications systems (UHF and SATCOM)
 - internal communications systems (intercommunication and CVR)
- applying logic processes, taking and interpreting system measurements to accurately and effectively isolate malfunctions within the above systems
- testing listed systems to isolate system faults and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the communications system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of advanced communication systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- the basic layout (block diagram level), function and operation of:
 - external communications systems (UHF and SATCOM)
 - internal communications systems (intercommunication and cockpit voice recorders)
- maintenance requirements for the above systems and troubleshooting procedures

- relevant WHS practices
- basic principles/functions, relating to the above-listed systems and associated with:
 - electromagnetic radiation and propagation
 - basic AC and DC circuit theory
 - printed circuit boards
 - digital fundamentals
 - analogue fundamentals
 - transmitter and receiver principles
 - antenna characteristics
 - transmission line characteristics
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one (1) major system component/line replaceable unit (LRU) from each of:
 - UHF and SATCOM
 - intercommunication and CVR systems.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

- Individuals being assessed who have already attained MEA214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components will have already covered a considerable amount of the skill and knowledge requirements for this unit and will have demonstrated capability in a number of tasks that also relate to the performance criteria for Elements 1, 2 and 3. The Log of Industrial Experience and Achievement records relating to MEA214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components may be accepted as also meeting some of the evidence requirements for this unit in the applicable areas.

MEA216 Inspect, test and troubleshoot instrument landing systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot instrument landing systems (ILS) and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA206	Remove and install basic radio communication and navigation system components
MEA207	Remove and install aircraft electronic system components
MEA246	Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----------------------------------|---|
| 1. Inspect ILS and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 ILS components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust ILS and components | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 ILS is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot ILS | 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 ILS faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures |

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA216 Inspect, test and troubleshoot instrument landing systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the ILS being maintained
- recognition of system and component defects/external damage, correct installation, attaching hardware (including cabling/harnesses/transmission lines) and security in ILS
- applying logic processes, taking and interpreting system measurements to accurately and effectively isolate malfunctions within the system
- performing system testing to isolate system faults and assess post maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the ILS being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of ILS systems and components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- the basic layout (block diagram level), function and operation of the system
- integration with other avionic systems
- the location and operation of ground:
 - marker beacons
 - localiser transmitter
 - glideslope transmitter

- ILS maintenance requirements and troubleshooting procedures
- relevant WHS practices
- basic principles/functions relating to the system and associated with:
 - electromagnetic radiation and propagation
 - basic alternating current (AC) and direct current (DC) circuit theory
 - digital fundamentals
 - analogue fundamentals
 - transmitter and receiver principles
 - antenna characteristics
 - transmission line characteristics
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on an ILS system and at least one (1) major system component/line replaceable unit (LRU). This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA217 Inspect, test and troubleshoot fixed wing autopilot systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot fixed wing multi-axis autopilot systems and components of fixed wing aircraft that have multi-axis autopilot systems, including those incorporating a radio-coupled flight director, during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207 Remove and install aircraft electronic system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1. Inspect fixed wing autopilot systems and components	<p>1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements</p> <p>1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual</p> <p>1.3 Autopilot systems and components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements</p> <p>1.4 Defects are correctly identified and reported</p>
2. Test/adjust fixed wing autopilot systems and components	<p>2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation</p> <p>2.2 Autopilot systems are functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction</p> <p>2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate</p>
3. Troubleshoot fixed wing autopilot systems	<p>3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination</p> <p>3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level</p> <p>3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process</p> <p>3.4 Autopilot system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures</p>

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Autopilot systems and components include:

- Three axis autopilot systems and components, including those incorporating a radio-coupled flight director

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA217C Inspect, test and troubleshoot fixed wing autopilot systems and components

Assessment Requirements for MEA217 Inspect, test and troubleshoot fixed wing autopilot systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the autopilot and flight director system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in:
 - flight director components and interface
 - multi-axis autopilot system components
- applying logic processes, taking and interpreting system measurements, use test equipment and appropriate wiring diagrams and manuals, to accurately and effectively isolate malfunctions in the above systems
- testing listed systems to isolate system malfunctions and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the autopilot system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across an autopilot system and its components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- the basic layout (block diagram level), function and operation of:
 - flight director components and interface

- multi-axis autopilot system components
- integration with other avionic systems, e.g. flight management systems and navigation systems
- flight director and autopilot system maintenance requirements and troubleshooting procedures
- relevant WHS practices
- basic principles/functions, relating to the listed systems and associated with:
 - basic alternating current (AC) and direct current (DC) circuit theory
 - digital fundamentals
 - analogue fundamentals
 - fixed wing flight theory
 - inner and outer loop control
 - flight control modes/channels
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on an autopilot system and its components. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA218 Inspect, test and troubleshoot rotary wing autopilot systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot rotary wing autopilot systems and components, including those incorporating a radio-coupled flight director during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

MEA219 Inspect, test and troubleshoot aircraft pressurisation control systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot fixed wing aircraft pressurisation control systems and components during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

This unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway, and is also part of the Mechanical Aircraft Maintenance Engineer licensing pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA208 Remove and install pressurisation control system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1. Inspect pressurisation control systems and components	<p>1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements</p> <p>1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual</p> <p>1.3 Pressurisation control systems and components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements</p> <p>1.4 Defects are correctly identified and reported</p>
2. Test/adjust pressurisation control systems and components	<p>2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation</p> <p>2.2 Pressurisation control systems are functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction</p> <p>2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate</p>
3. Troubleshoot pressurisation control systems	<p>3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination</p> <p>3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level</p> <p>3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process</p> <p>3.4 Pressurisation control system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where</p>

required, in accordance with standard enterprise procedures

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Pressurisation control systems include:

- Cabin altimeters
 - Differential pressure indicators
 - Cabin rate of climb indicators
 - Pressure controllers (manual and automatic)
 - Safety switches
- Procedures and requirements include:
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA219C Inspect, test and troubleshoot aircraft pressurisation control systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA219 Inspect, test and troubleshoot aircraft pressurisation control systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the pressurisation control system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in:
 - cabin altimeters, differential pressure indicators and cabin rate of climb indicators
 - pressure controllers (manual and automatic)
 - safety switches
- applying logic processes, taking and interpreting system measurements, and using test equipment and appropriate wiring diagrams and manuals to accurately and effectively isolate malfunctions in the listed system components
- assisting with the performance of pressurisation system testing to isolate system malfunctions and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the pressurisation control system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a pressurisation control system and its components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- the basic layout (block diagram level), function and operation of the listed components and their operation and function within the aircraft pressurisation system, including applicable interface with the outflow and safety valves:
 - cabin altimeters
 - differential pressure indicators
 - cabin rate of climb indicators
 - pressure controllers (manual and automatic)
 - safety switches
- basic principles/functions, relating to the listed system components and associated with:
 - basic alternating current (AC) and direct current (DC) circuit theory
 - digital fundamentals
 - analogue fundamentals
 - atmospheric conditions, properties and effect on humans
 - pressurisation terminology
- pressurisation control system maintenance requirements and troubleshooting procedures
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a pressurisation control system and its components. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA220 Inspect, test and troubleshoot aircraft primary radar systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot primary radar systems and components of fixed and rotary wing aircraft that have primary radar systems, such as weather radar during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207 Remove and install aircraft electronic system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |

Assessment Requirements for MEA220 Inspect, test and troubleshoot aircraft primary radar systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the primary radar system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses/transmission lines/wave guides) and security in radar (navigation/weather) system components and interface
- applying logic processes, taking and interpreting system measurements, to accurately and effectively isolate malfunctions within the system and system components
- performing system testing to isolate system malfunctions and assess system's post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the radar system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a primary radar system and its components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- the basic layout (block diagram level), function and operation of primary radar systems
- basic principles/functions relating to the system components and associated with:
 - basic alternating current (AC) and direct current (DC) circuit theory
 - digital fundamentals

- analogue fundamentals
- radar fundamentals
- transmission lines, waveguide and antenna characteristics
- primary radar system maintenance requirements and troubleshooting procedures
- relevant WHS practices including those relating to ground functional testing of radar systems
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a primary radar system and at least one (1) major system component/line replacement unit (LRU). This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA221 Inspect, test and troubleshoot aircraft secondary radar systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot secondary radar systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207 Remove and install aircraft electronic system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Inspect secondary radar systems and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 Secondary radar system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust secondary radar systems and components | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Secondary radar system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction while observing WHS requirements relating to ground testing |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot secondary radar systems | 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 Secondary radar system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required |

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Secondary radar systems include:

- Air traffic control (ATC) transponder
- Radio altimeter
- Distance measuring equipment (DME)
- Doppler navigation system
- Airborne collision avoidance system (ACAS)
- Automatic dependent surveillance-broadcast (ADS-B)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA221C Inspect, test and troubleshoot aircraft secondary radar systems and components

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA221 Inspect, test and troubleshoot aircraft secondary radar systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the pulse system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses/transmission lines) and security in:
 - DME components and interface
 - radio altimeters
 - ATC transponders
 - doppler navigation system
 - ACAS
 - ADS-B
- applying logic processes, taking and interpreting system measurements to accurately and effectively isolate malfunctions within the systems
- testing systems to isolate system malfunctions and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across secondary radar systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods

- the basic layout (block diagram level), function and operation of:
 - DME, including components and interface
 - radio altimeters
 - ATC transponders
 - doppler navigation system
 - ACAS
 - ADS-B
- basic principles/functions, relating to the listed systems and associated with:
 - basic alternating current (AC) and direct current (DC) circuit theory
 - digital fundamentals
 - analogue fundamentals
 - radar fundamentals
 - transmission lines, waveguide and antenna characteristics
- pulse system maintenance requirements and troubleshooting procedures
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) of the following secondary radar systems and its major system components/line replaceable units (LRU):
 - ATC transponder
 - radio altimeter
 - DME
 - doppler navigation system
 - ACAS
 - ADS-B.

- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA222 Inspect, test and troubleshoot aircraft oxygen systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot aircraft oxygen systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic (Aircraft Maintenance Stream) training pathways and is also part of the Mechanical Aircraft Maintenance Engineer licensing pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA209 Remove and install aircraft oxygen system components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Oxygen system components include:**
- Oxygen pressure cylinders, valves and gauges
 - Regulators, masks (including other integrated systems), pipes, hoses and fittings
 - Chemical generators (where applicable to the enterprise)
 - Liquid dry breathing oxygen (LDBO) converters (where applicable to the enterprise)
- Troubleshooting includes:**
- The use of fault-finding charts or similar, to line replacement level
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA222 Inspect, test and troubleshoot aircraft oxygen systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- applying appropriate WHS practices
- using approved maintenance documentation and aircraft publications relating to aircraft oxygen systems and components for the purpose of system testing
- general application of logical fault-finding and use of truth tables during troubleshooting
- interpreting oxygen system instruments, gauges, warning annunciators and test equipment, i.e. leak detectors
- applying the methods used to locate, identify and access oxygen system components for inspection, testing and troubleshooting
- demonstrating the procedure to replenish a dry breathing oxygen system, including:
 - correct identification of oxygen ground trolleys
 - maximum charging pressures for low and high pressure systems
 - safety precautions to be adhered to during replenishment
 - correct order of procedural replenishment steps
- demonstrating the procedure to purge a dry breathing oxygen system, including:
 - reasons for the requirement to undertake a purging operation
 - identification of acceptable system purging gases
 - safety precautions to be adhered to during purging
- employing correct techniques when purging oxygen storage cylinders or systems.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the oxygen system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of aircraft oxygen systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods, connection of hardware and couplings and their physical security within the aircraft
- oxygen system isolation
- properties of aircraft oxygen and requirements for aircrew/passengers
- properties of the atmosphere and how they vary
- defining terms and units of measurement relating to aircraft altitude and system pressures
- layout of low and high-pressure dry breathing oxygen systems and components
- operation of oxygen systems and components, including:
 - pressure demand regulators
 - passenger service regulators
 - altitude sensing barometers
- methods by which gaseous dry breathing oxygen is stored in both the aircraft and within the workplace environment. Reference to storage trolleys, aircraft cylinders and chemical oxygen cylinders is required
- oxygen system maintenance requirements and troubleshooting procedures
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of:
 - oxygen pressure cylinders, valves and gauges
 - regulators, masks (including other integrated systems), pipes, hoses and fittings
 - chemical generators (may be omitted if not applicable to the enterprise)
 - LDBO converters (may be omitted if not applicable to the enterprise).

- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

| 1. Inspect electrical systems and components | 1.1 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.2 Electrical system components and hardware are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Defects are correctly identified and recorded in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Electrical systems and components include:

- Alternating current (AC) and/or direct current (DC) power generation, regulation and distribution systems
- Battery installations and bus ties/interlocks
- Rotary and static inverters and transformer rectifier (TR) units
- Air cycle air conditioning and pressurisation systems
- Flight and engine control systems
- Ignition and starting systems
- Fire/smoke detection and extinguishing
- Lighting
- Master and caution warning systems
- Equipment and furnishing

- Equipment cooling and ventilation
- Position indicating systems
- Fuel storage and distribution
- Propeller control systems (where applicable to the enterprise)
- Landing gear indication and anti-skid (where applicable to the enterprise)
- Ice and rain protection (where applicable to the enterprise)
- Wastewater (where applicable to the enterprise)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Assessment Requirements for MEA223 Inspect aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the avionic system being maintained
- recognition of system and electrical component defects/external damage, correct installation, connection of plugs, terminations, and attaching hardware (including cabling/harnesses) and security in:
 - AC and DC power generation systems, including regulation, distribution, control and cooling
 - battery installations and inverters
 - flight control and/or electro-hydraulic systems
 - engine ignition, starting, fuel distribution and control systems
 - internal/external lighting systems, including controls
 - doors
 - landing gear systems
 - anti-skid braking systems
 - master caution and warning systems
- auxiliary systems (including ice/rain protection, fire detection, environmental control and pressurisation, waste and water, equipment and furnishings).

It is essential that inspection procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection is essential. This is to be demonstrated through application across a range of aircraft electrical systems, components and hardware listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods and connection of hardware
- explaining the basic layout (block diagram level) and operation of:
 - AC and DC power generation systems, including regulation, distribution, control and cooling
 - battery installations and inverters
 - flight control and/or electro-hydraulic systems
 - engine ignition, starting, fuel distribution and control systems
 - internal/external lighting systems, including controls
 - doors
 - landing gear systems
 - anti-skid braking systems
 - master caution and warning systems
 - auxiliary systems (including ice/rain protection, fire detection, environmental control and pressurisation, waste and water, equipment and furnishings)
- WHS requirements applicable to the maintenance of aircraft electrical systems, including gas turbine engine high-energy ignition units
- electrical system maintenance requirements
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and related components in the following groups:
 - AC and/or DC power generation, regulation and distribution systems
 - battery installations and bus ties/interlocks
 - rotary and static inverters and TR units
 - air cycle air conditioning and pressurisation systems
 - flight and engine control systems
 - ignition and starting systems
 - fire/smoke detection and extinguishing

- lighting
- master and caution warning systems
- equipment and furnishing
- equipment cooling and ventilation
- position indicating systems
- fuel storage and distribution
- propeller control systems (may be omitted if not applicable to the enterprise)
- landing gear indication and antiskid (may be omitted if not applicable to the enterprise)
- ice and rain protection (may be omitted if not applicable to the enterprise)
- wastewater (may be omitted if not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components, will have covered a significant proportion of the Performance Criteria for Element 1 and will have covered many of the Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.
- The relationship between MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components and MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components may also be taken into account where MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components, has been attained, but not MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components. Advice in MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components regarding the coverage of MEA274 Maintain basic light aircraft electrical systems and components, may also be taken into consideration where applicable.

| MEA205 | Remove and install advanced aircraft general instrument system components |
| MEA246 | Fabricate and/or repair aircraft electrical components or parts |

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect instrument systems and components | 1.1 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.2 Instrument system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Defects are correctly identified and recorded in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Instrument systems and components include:

- Flight instruments, including pitot/static systems, airspeed indicators (ASIs), vertical speed indicators (VSIs), altimeters, altitude alerting and reporting, turn and bank and slip/turn coordinators, directional gyros (DGs) and artificial horizons (AHs) (air and electrically driven)
- Machmeters, air data systems, angle of attack, stall warning and avoidance systems
- Flight data recorders (FDRs)
- Engine indication systems
- Magnetic compasses and attitude and heading reference system (AHRS)
- Miscellaneous instrument systems, including pressure

- measurement, fuel quantity, fuel flow, position indication, voltage and frequency, current and power
- Procedures and requirements include:**
- Ground proximity warning system (GPWS)
 - Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA224 Inspect aircraft instrument systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

- Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:
- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the instrument system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, and attaching hardware (including cabling/harnesses) and security in:
 - pitot/static systems and associated instruments and systems
 - flight instruments
 - GPWS and FDR
 - stall warning, angle of attack and stall avoidance systems
 - navigation systems (compasses and AHRS)
- pressure measurement, position indicators, engine/auxiliary system indication systems, including fuel quantity and flow.

It is essential that inspection procedures, cleanliness requirements and safety precautions applicable to the instrument system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection is essential. This is to be demonstrated through application across a range of aircraft instrument systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware
- instrument system maintenance requirements
- the basic layout (block diagram level), function and operation of:

- flight instruments, including:
 - ASIs
 - VSIs
 - air data systems and components
 - machmeters
 - altimeters, including servo and encoding altimeters
 - turn and slip indicators
 - AHs
 - DGs
 - angle of attack and stall warning/avoidance systems
- pitot/static systems
- navigation systems:
 - direct reading compasses
 - gyro compasses
 - AHRS
- GPWS
- turbine engine instruments, including:
 - temperature and pressure, including thermocouples, sensors and transmitters
 - speed, including mechanical and electric tachometers
 - thrust, including fan, propeller and jet
 - torque
 - fuel flow
 - vibration
- auxiliary transmitter/indicator measuring systems, including:
 - hydraulic pressure and temperature
 - pneumatic pressure
 - transmission oil pressure and temperature
 - fuel remaining/used
 - fuel quantity indication
 - component position (e.g. doors, flaps, speed brakes and landing gear)
- FDR systems
- relevant WHS practices
- instrument system maintenance requirements
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least (1) one major system component/line replacement unit (LRU) from each of the following groups:
 - flight instruments, including pitot/static systems, ASIs, VSIs, altimeters, altitude alerting and reporting, turn and bank and slip/turn coordinators, DGs and AHs (air and electrically driven)
 - machmeters, air data systems, angle of attack, stall warning and avoidance systems
 - FDRs
 - engine indication systems
 - magnetic compasses and AHRS
 - miscellaneous instrument systems, including pressure measurement, fuel quantity, fuel flow, position indication, voltage and frequency, current and power
 - GPWS.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and components, will have covered a significant proportion of the Performance Criteria for Element 1 and will have covered many of the Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and components, may be accepted as also meeting the evidence requirements for this unit in the applicable areas.
- The relationship between MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and components, and MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components may also be taken into account where MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components has been attained, but not MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and components. Advice in MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components regarding the coverage of MEA275 Maintain basic light aircraft instrument systems and components, may also be taken into consideration where applicable.

ME A225 Inspect fixed wing aircraft automatic flight control systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications to inspect aircraft automatic flight control systems and components of fixed wing aircraft that have automatic flight control systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

ME A207 Remove and install aircraft electronic system components

ME A246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect automatic flight control systems and components | 1.1 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.2 Automatic flight control system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Defects are correctly identified and recorded in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Automatic flight control systems and components include:

- Automatic pilots and associated integrated systems and components, including:
 - automatic pilot
 - flight director
 - automatic trim
 - yaw damper
 - automatic throttle and automatic landing (where applicable to the enterprise)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA225C Inspect fixed wing aircraft automatic flight control systems and components

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA225 Inspect fixed wing aircraft automatic flight control systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the automatic flight control system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, and attaching hardware (including cabling/harnesses) and security in automatic flight control system and components.

It is essential that inspection procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection is essential. This is to be demonstrated through application across a range of aircraft automatic flight control systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- the basic layout (block diagram level), and operation of the system, including the interface with:
 - flight management systems
 - navigation systems
 - flight control actuators
 - engine management systems
- relevant WHS practices
- maintenance requirements
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - automatic pilot
 - flight director
 - automatic trim
 - yaw damper
 - automatic throttle and automatic landing (may be omitted where it is not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA226 Inspect aircraft electronic systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications to inspect aircraft electronic systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207 Remove and install aircraft electronic system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.

demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect electronic systems and components | 1.1 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.2 Electronic system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Defects are correctly identified and recorded in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Electronic systems and components include:

- Electronic instrument displays – electronic flight instrument system (EFIS), engine indicating and crew alerting system (EICAS), flight management computer system (FMCS), electronic central aircraft monitor system (ECAM) and head-up display (HUD) (where applicable to the enterprise)
- Instrument navigation systems – inertial navigation system (INS), inertial reference system (IRS), compasses and attitude and heading reference system (AHRS)
- Communication systems – high frequency (HF), very high frequency (VHF), ultra-high frequency (UHF), satellite communications (SATCOM), intercom, data and cabin network services, emergency location transmitter (ELT) and cockpit voice recorder (CVR)
- Radio navigation systems – automatic direction finding (ADF), very high frequency omni-range (VOR), instrument landing system (ILS) and global navigation systems (GNS)
- Pulse operated systems – weather radar, navigation radar,

air traffic control (ATC) transponder, automatic dependent surveillance-broadcast (ADS-B), radio altimeter (RADALT), distance measuring equipment (DME), doppler and airborne collision avoidance system (ACAS) (where applicable to the enterprise)

- Integrated modular avionics (where applicable to the enterprise)
- Information systems – air traffic and information management, network servers (where applicable to the enterprise)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – developed from and MEA226D Inspect aircraft electronic systems and components but not equivalent

Assessment Requirements for MEA226 Inspect aircraft electronic systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the avionic system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, and attaching hardware (including cabling/harnesses) and security in:
 - multi-function display systems (interface units, display generators and display units), i.e. HUD, EICAS, FMS, ACARS, EFIS and ECAM
 - integrated modular avionics (where applicable to the enterprise)
 - INS and IRS
 - external communications systems:
 - HF
 - UHF
 - VHF
 - SATCOM
 - ELT
 - internal communications systems:
 - intercommunication
 - cabin intercommunication data systems
 - cabin network services
 - CVR
 - information systems, such as air traffic and information management systems, and network server systems (where applicable to the enterprise)
 - RF navigation systems:
 - ILS
 - VOR
 - ADF
 - GNS
 - pulse systems that are applicable to the enterprise, including:

- primary radar (navigation/weather) components and interface
- ACAS components and interface
- radio altimeter components and interface
- DME components and interface
- ATC transponders
- ADS-B

It is essential that inspection procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection is essential. This is to be demonstrated through application across a range of electronic systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods and connection of hardware
- the basic layout (block diagram level) and operation of:
 - multi-function display systems (interface units, display generators and display units), i.e. HUD, ICAS, FMS, ACARS, EFIS and ECAM
 - integrated modular avionics
 - INS and IRS
 - external communications systems:
 - HF
 - UHF
 - VHF
 - SATCOM
 - ELT
 - internal communications systems:
 - intercommunication
 - cabin intercommunication data systems
 - cabin network services
 - CVR
 - information systems, such as air traffic and information management systems, and network server systems
 - RF navigation systems:
 - ILS

- VOR
- ADF
- GNS
- primary radar (navigation/weather) components and interface
- ACAS components and interface
- radio altimeter components and interface
- DME components and interface
- ATC transponders
- ADS-B.
- relevant WHS practices
- maintenance requirements
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on each type of system listed in the following groups and on at least one (1) component for each listed system type:
 - electronic instrument displays – EFIS, EICAS, FMS, ECAM and HUD (where applicable to the enterprise)
 - instrument navigation systems – INS, IRS, compasses and AHRS
 - communication systems – HF, VHF, UHF, SATCOM, intercom, data and cabin network services, ELT and CVR
 - radio navigation systems – ADF, VOR, ILS and GNS
 - pulse operated systems – weather radar, navigation radar, ATC transponder, ADS-B, RADALT, DME, doppler and ACAS (where applicable to the enterprise)
 - integrated modular avionics (where applicable to the enterprise)
 - information systems – air traffic and information management, network servers (where applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy National Vocational Education and Training Regulator (NVR)/Australian Quality Training Framework (AQTF) assessor requirements.

- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained any of MEA214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components, MEA215 Inspect, test and troubleshoot advanced aircraft communications systems and components, MEA216 Inspect, test and troubleshoot instrument landing systems and components, MEA220 Inspect, test and troubleshoot aircraft primary radar systems and components, and MEA221 Inspect, test and troubleshoot aircraft secondary radar systems and components, MEA233 Inspect, test and troubleshoot aircraft inertial navigation and reference systems and components, and MEA234 Inspect, test and troubleshoot aircraft global navigation systems and components, will have covered a significant proportion of the Performance Criteria for Element 1 and will have covered Range of Conditions variables applicable to the unit. The Log of Industrial Experience and Achievement records relating to MEA214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components, MEA215 Inspect, test and troubleshoot advanced aircraft communications systems and components, MEA216 Inspect, test and troubleshoot instrument landing systems and components, MEA220 Inspect, test and troubleshoot aircraft primary radar systems and components, MEA221 Inspect, test and troubleshoot aircraft secondary radar systems and components, MEA233C Inspect, test and troubleshoot aircraft inertial navigation and reference systems and components, MEA234 Inspect, test and troubleshoot aircraft global navigation systems and components,
- MEA276 Maintain basic aircraft communication and radio navigation systems and components, MEA278 Inspect, test and troubleshoot instrument display systems and components, and MEA289 Maintain basic light aircraft avionic systems and components, may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

MEA227 Test and troubleshoot aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to test and troubleshoot aircraft electrical systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathways and is also part of the Mechanical Aircraft Maintenance Engineer licensing pathway

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA223 Inspect aircraft electrical systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.	demonstrate achievement of the element.
1. Prepare for troubleshooting	1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify an unserviceability
2. Test/adjust electrical systems	2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
	2.2 Electrical system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction while observing all relevant work health and safety (WHS) requirements
	2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate
3. Troubleshoot electrical systems	3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination
	3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level
	3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
	3.4 System faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required
	3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Electrical systems and components include:

- All related electrical hardware, looms and cables
- Alternating current (AC) and/or direct current (DC) power generation, regulation and distribution systems
- Rotary and static inverters and transformer rectifier (TR) units
- Air cycle air conditioning and pressurisation systems
- Flight and engine control systems
- Ignition and starting systems
- Fire/smoke detection and extinguishing
- Lighting (internal and external)
- Master and caution warning systems
- Equipment cooling and ventilation
- Equipment and furnishing
- Position indicating systems
- Fuel storage and distribution
- Landing gear indication and anti-skid
- Main batteries and battery bus ties/interlocks
- Propeller control systems (where applicable to the enterprise)
- Ice and rain protection (where applicable to the enterprise)
- Wastewater (where applicable to the enterprise)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA227D Test and troubleshoot aircraft electrical systems and components

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA227 Test and troubleshoot aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the electrical system being maintained
- recognition of system and electrical component defects/external damage, correct installation, connection of plugs, terminations, and attaching hardware (including cabling/harnesses) and security in:
 - AC and DC power generation systems, including regulation, distribution, control and cooling
 - battery installations
 - flight control and/or electro-hydraulic systems
 - engine ignition, starting, fuel distribution and control systems
 - internal/external lighting systems, including controls
 - landing gear systems
 - anti-skid braking systems
 - auxiliary systems, including ice/rain protection, fire detection, environmental control and pressurisation, water and waste, doors, propeller control, equipment and furnishings
 - equipment cooling and ventilation systems
 - master caution and warning systems
- applying logic processes, taking and interpreting electrical measurements, and using test equipment and appropriate wiring diagrams and manuals to isolate electrical system malfunctions of the above components and systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to testing and troubleshooting is essential. This is to be demonstrated through application across a range of aircraft electrical systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware
- explaining the basic layout (block diagram level), function and operation of:
 - AC and DC power generation systems, including regulation, distribution, control and cooling
 - battery installations
 - flight control and/or electro-hydraulic systems
 - engine ignition, starting, fuel distribution and control systems
 - internal/external lighting systems, including controls
 - landing gear systems
 - anti-skid braking systems
 - auxiliary systems, including ice/rain protection, fire detection, environmental control and pressurisation, water and waste, doors, propeller control, equipment and furnishings
 - equipment cooling and ventilation systems
 - master caution and warning systems
- explaining basic principles/functions, relating to systems listed above and associated with:
 - basic AC and DC circuit theory
 - digital fundamentals
 - analogue fundamentals
 - AC and DC generator characteristics
 - single and polyphase AC motors and DC motors
 - rotary and static inverters
 - air cycle air conditioning
 - electrical sensing and transmitting devices
- WHS requirements applicable to the maintenance of aircraft electrical systems, including gas turbine engine high-energy ignition units
- electrical system maintenance requirements and troubleshooting procedures
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one (1) item from each of the following groups, including all related electrical hardware, looms and cables:
 - AC and/or DC power generation, regulation and distribution systems
 - rotary and static inverters and TR units
 - air cycle air conditioning and pressurisation systems
 - flight and engine control systems
 - ignition and starting systems
 - fire/smoke detection and extinguishing
 - lighting (internal and external)
 - master and caution warning systems
 - equipment cooling and ventilation
 - equipment and furnishing
 - position indicating systems
 - fuel storage and distribution
 - landing gear indication and anti-skid
 - main batteries and battery bus ties/interlocks (including a battery check)
 - propeller control systems (may be omitted if not applicable to the enterprise)
 - ice and rain protection (may be omitted if not applicable to the enterprise)
 - wastewater (may be omitted if not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

- Individuals being assessed who have already attained MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components, will have covered a significant proportion of the Performance Criteria for Elements 1, 2 and 3 and will have covered many of the Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components, may be accepted as also meeting the evidence requirements for this unit in the applicable areas.
- The relationship between MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components, and MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components, may also be taken into account where MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components, has been attained, but not MEA211 Inspect, test and troubleshoot advanced aircraft electrical systems and components. Advice in MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components, regarding the coverage of MEA274 Maintain basic light aircraft electrical systems and components, may also be taken into consideration where applicable.

MEA228 Test and troubleshoot aircraft instrument systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, standard trade practices and systems knowledge in the testing and troubleshooting of aircraft instrument and display systems and components during both scheduled and unscheduled maintenance on both fixed and rotary wing aircraft. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA224	Inspect aircraft instrument systems and components
MEA226	Inspect aircraft electronic systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.	demonstrate achievement of the element.
1. Prepare for troubleshooting	1.1 Relevant maintenance documentation and modification status, including system defect/service difficulty reports, where relevant, are interpreted to identify an unserviceability
2. Test/adjust instrument and display systems	2.1 The aircraft and systems are correctly prepared in accordance with specified procedures for the application of power and system operation
	2.2 Instrument or display system is functionally tested in accordance with specified procedures for evidence of serviceability or malfunction while observing all relevant work health and safety (WHS) requirements
	2.3 System calibration or adjustments are performed in accordance with specified procedures
3. Troubleshoot instrument and display systems	3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination
	3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level
	3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
	3.4 Instrument or display system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required
	3.5 Fault rectification requirements are determined to assist in planning the repair or adjustment

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work

situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Instrument or display systems include:

- Flight instruments – pitot/static systems, airspeed indicators (ASIs), machmeters, air data systems and instruments, vertical speed indicators (VSIs), altimeters, altitude alerting and reporting, turn and bank, directional gyros (DGs), artificial horizons (AHs), angle of attack, stall warning/avoidance, ground proximity warning system (GPWS) and flight data recorders (FDRs)
- Engine instruments – engine speed, pressure, temperature, performance, vibration and torque
- Instrument navigation systems – inertial navigation system (INS), inertial reference system (IRS), compasses and attitude and heading reference system (AHRS)
- Miscellaneous – pressure, fuel quantity, fuel flow, position, voltage, frequency, current and power
- Display systems – electronic flight instrument system (EFIS), engine indicating and crew alerting system (EICAS), flight management computer system (FMCS), electronic central aircraft monitor system (ECAM) and head-up display (HUD) (where applicable to the enterprise)
- Integrated modular avionics (where applicable to the enterprise)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA228D Test and troubleshoot aircraft instrument systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA228 Test and troubleshoot aircraft instrument systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills, tools and test equipment in the testing, adjustment and troubleshooting of instrument and display systems
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, and attaching hardware (including cabling/harnesses) for the systems listed in Range of Conditions
- interpreting the information presented on instrument and display systems
- applying logic processes and using appropriate wiring diagrams and manuals to isolate instrument and display system malfunctions
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process
- applying standard procedures
- observing all relevant WHS procedures.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the instrument system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to testing and troubleshooting is essential. This may be demonstrated through application across a range of aircraft instrument and display systems (where display systems are applicable to the enterprise) listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool and test equipment usage and installation/securing of system components

- the basic layout (block diagram level) of the systems listed in the Range of Conditions
- the operating principles of the systems listed in the Range of Conditions and associated with:
 - the properties and effects of atmospheric conditions on aircraft instruments and systems
 - pressure and temperature sensing elements and their use in aircraft instruments
 - gyroscopes and their use in aircraft instrument and reference systems
 - electrical fundamentals and display screen generation
- the various methods of navigation and how they are used by both conventional and electronic navigational instruments and systems
- maintenance requirements and troubleshooting procedures
- WHS procedures relating to instrument and display systems and components
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures, including software management control.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using procedures, tools and equipment specified in maintenance documentation. It is also expected that general purpose tools, test and ground support equipment found in most routine situations would be used where appropriate. The level of troubleshooting is limited in its application to the use of fault diagnosis guides or other similar information to enable troubleshooting to line replaceable item level.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on a system and on at least one (1) major system component of each of the following groups:
 - flight instruments – pitot/static systems, ASIs, machmeters, air data systems and instruments, VSIs, altimeters, altitude alerting and reporting, turn and bank, DGs, AHs, angle of attack, stall warning/avoidance, GPWS and FDRs
 - engine Instruments – engine speed, pressure, temperature, performance, vibration and torque
 - instrument navigation systems – INS, IRS, compasses and AHRS
 - miscellaneous – pressure, fuel quantity, fuel flow, position, voltage, frequency, current and power
 - display systems – EFIS, EICAS, FMCS, ECAM and HUD (may be omitted if not applicable to the enterprise)

- integrated modular avionics (may be omitted if not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems, will have covered a significant proportion of the Performance Criteria for Elements 1, 2 and 3 and will have covered many of the Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems, may be accepted as also meeting the evidence requirements for this unit in the applicable areas.
- The relationship between MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems and MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components, may also be taken into account where MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components has been attained, but not MEA213 Inspect, test and troubleshoot advanced aircraft instrument systems. Advice in MEA212 Inspect, test and troubleshoot basic aircraft instrument systems and components regarding the coverage of MEA275 Maintain basic light aircraft instrument systems and components, may also be taken into consideration where applicable.

MEA229 Test and troubleshoot aircraft radio frequency navigation and communications systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to test and troubleshoot communication and radio frequency (RF) navigation systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA226 Inspect aircraft electronic systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.	demonstrate achievement of the element.
1. Prepare for troubleshooting	1.1 Relevant maintenance documentation and modification status, including system defect reports where relevant, are used to identify an unserviceability
2. Test/adjust RF navigation and communications systems	2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
	2.2 RF navigation or communication system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction while observing all relevant work health and safety (WHS) requirements
	2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate
3. Troubleshoot RF navigation and communications systems	3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination
	3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level
	3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
	3.4 RF navigation or communication system faults are located and the causes are clearly identified and correctly recorded in maintenance documentation, where required
	3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

RF navigation or communication systems include:

- Control and sensing associated with cockpit radio, ground and flight crew communications including frequency modulation (FM) and amplitude modulation (AM) modes of operation in the high frequency (HF), ultra-high frequency (UHF), and very high frequency (VHF) bands, microwave systems and satellite communications (SATCOM)
- Passenger communications, cockpit voice recorder (CVR), audio integration system, cabin intercommunication data systems and cabin network services (where applicable to the enterprise)
- Information systems, such as air traffic and information management systems, and network server systems (where applicable to the enterprise)
- Instrument landing system (ILS), very high frequency omni-range (VOR), automatic direction finding (ADF), global navigation system (GNS), emergency beacons and aircraft communications addressing and reporting system (ACARS)
- Antennae, impedance audio matching devices, microphones and headphones, transmission lines, computer controls, line replaceable units, transmitters/receivers and indicators
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA229D Test and troubleshoot aircraft radio frequency navigation and communications systems and components

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA229 Test and troubleshoot aircraft radio frequency navigation and communications systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the RF and communications system being maintained
- recognition of system and component defects/external damage, correct installation, and attaching hardware (including cabling/harnesses/transmission lines) and security in:
 - external communications systems:
 - HF
 - UHF
 - VHF
 - SATCOM and microwave
 - internal communications systems, including:
 - intercommunication
 - cabin intercommunication data systems (where applicable to the enterprise)
 - cabin network services (where applicable to the enterprise)
 - CVR
 - information systems, such as air traffic and information management systems, and network server systems (where applicable to the enterprise)
 - RF navigation systems:
 - ILS
 - VOR
 - ADF
 - GNS
 - ACARS
 - ELT systems
- applying logic processes, taking and interpreting system measurements to accurately and effectively isolating malfunctions within the systems
- performing system testing to isolate system faults and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the aircraft communication and RF navigation system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to testing and troubleshooting is essential. This is to be demonstrated through application across a range of aircraft communication and RF navigation systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- explaining the basic layout (block diagram level), function and operation of:
 - external communications systems:
 - HF
 - UHF
 - VHF
 - SATCOM and microwave
 - internal communications systems, including:
 - intercommunication
 - cabin intercommunication data systems (where applicable to the enterprise)
 - cabin network services (where applicable to the enterprise)
 - CVR
 - information systems, such as air traffic and information management systems, and network server systems
 - RF navigation systems:
 - ILS
 - VOR
 - ADF
 - GNS
 - ACARS
 - ELT systems
- explaining basic principles/functions relating to the above systems and associated with:
 - electromagnetic radiation and propagation
 - basic AC and DC circuit theory
 - digital fundamentals

- analogue fundamentals
- antenna characteristics
- transmission line characteristics
- WHS requirements
- system and component maintenance requirements and troubleshooting procedures
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) system and its major components from each of the following groups:
 - control and sensing associated with cockpit radio, ground and flight crew communications including FM and AM modes of operation in the HF, UHF, and VHF bands, microwave systems and SATCOM
 - passenger communications, CVR, audio integration system, cabin intercommunication data systems and cabin network services (may be omitted if not applicable to the enterprise)
 - information systems, such as air traffic and information management systems, and network server systems (may be omitted if not applicable to the enterprise)
 - ILS, VOR, ADF, GNS, emergency beacons and ACARS
- and the following general associated components:
 - antennae, impedance audio matching devices, microphones and headphones, transmission lines, computer controls, line replaceable units, transmitters/receivers and indicators.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

- Individuals being assessed who have already attained any of MEA214 Inspect, test and troubleshoot aircraft basic communication and radio navigation systems and components, MEA215 Inspect, test and troubleshoot advanced aircraft communications systems and components, MEA216 Inspect, test and troubleshoot instrument landing systems and components, MEA234 Inspect, test and troubleshoot aircraft global navigation systems and components, MEA276 Maintain basic aircraft communication and radio navigation systems and components and MEA289 Maintain basic light aircraft avionic systems and components, will have covered Element 1 plus a significant proportion of the Performance Criteria for Elements 2 and 3 and will have covered common Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to these units may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

MEA230 Test and troubleshoot fixed wing aircraft automatic flight control systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications to test and troubleshoot aircraft automatic flight control systems and components of fixed wing aircraft that have automatic flight control systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit of competency is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathways and is an alternative unit to MEA231 Inspect, test and troubleshoot rotary wing aircraft automatic flight control systems and components.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

- | | |
|--------|---|
| MEA225 | Inspect fixed wing aircraft automatic flight control systems and components |
| MEA246 | Fabricate and/or repair aircraft electrical components or parts |

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Prepare for troubleshooting | 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify an unserviceability |
| 2. Test/adjust automatic flight control system | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
2.2 Automatic flight control system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction while observing all relevant work health and safety (WHS) requirements
2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot automatic flight control system | 3.1 Available information from maintenance documents and inspection and test results is used, where necessary, to assist in fault determination
3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level
3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
3.4 Automatic flight control system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required
3.5 Rectification requirements are determined |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Automatic flight control systems include:

- Automatic pilot
- Flight director
- Automatic trim
- Yaw damper
- Automatic throttle and automatic landing (where applicable to the enterprise)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA230C Test and troubleshoot fixed wing aircraft automatic flight control systems and components

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA230 Test and troubleshoot fixed wing aircraft automatic flight control systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the automatic flight control system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, and attaching hardware (including cabling/harnesses) and security in:
 - flight director components and interface
 - flight control components and interface
 - automatic throttle components and interface (where applicable to the enterprise)
 - automatic pilot system and interface
- applying logic processes, taking and interpreting system measurements, using test equipment and appropriate wiring diagrams and manuals to accurately and effectively isolate malfunctions in the above systems
- performing system testing to isolate system malfunctions and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the automatic flight control system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to testing and troubleshooting is essential. This is to be demonstrated through application across a range of aircraft automatic flight control systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- explaining the basic layout (block diagram level), function and operation of:
 - flight director components and interface
 - flight control components and interface
 - automatic throttle components and interface
 - automatic pilot system and interface
 - flight management system interface
 - navigation system interfaces
- explaining basic principles/functions, relating to the above systems and associated with:
 - basic AC and DC circuit theory
 - digital fundamentals
 - analogue fundamentals
 - fixed wing flight theory
 - inner and outer loop control
 - fixed wing flight control system (mechanical, hydraulic and electro-mechanical types, trim and stabilisation)
 - flight control modes/channels
- WHS requirements
- system and component maintenance requirements and troubleshooting procedures
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one item from each of the following groups:

- automatic pilot
- flight director
- automatic trim
- yaw damper
- automatic throttle and automatic landing (may be omitted where not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA231 Inspect, test and troubleshoot rotary wing aircraft automatic flight control systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot rotary wing automatic flight control systems and components of rotary wing aircraft that have automatic flight control systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway and is an alternative unit to MEA225 Inspect fixed wing aircraft automatic flight control systems and components and MEA230 Test and troubleshoot fixed wing aircraft automatic flight control systems and components.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207 Remove and install aircraft electronic system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1. Inspect automatic flight control system and components	1.1 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual
	1.2 Automatic flight control system is visually or physically checked for external signs of defects in accordance with applicable maintenance manual
	1.3 Defects are correctly identified and reported
2. Test/adjust automatic flight control system	2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
	2.2 Automatic flight control system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction while observing all relevant work health and safety (WHS) requirements
	2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate
3. Prepare for troubleshooting	3.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify an unserviceability
4. Troubleshoot automatic flight control system	4.1 Available information from maintenance documents and inspection and test results is used, where necessary, to assist in fault determination
	4.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level
	4.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
	4.4 Automatic flight control system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required
	4.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Automatic flight control systems include:

- Flight director –indicators, computers, control boxes and interfaces with other systems
- Flight controls –servo actuators (roll, pitch, yaw and trim) computers and sensors
- Autopilot system –computers, sensors (gyros and/or accelerometers), controllers, mode selectors and system interface, control wheel steering (CWS), disconnect, go around and trim switches

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

MEA232 Test and troubleshoot aircraft pulse systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to test and troubleshoot pulse systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Pulse systems and components include:

- Navigation radar
- Weather radar
- Radio altimeter (RADALT)
- Distance measuring equipment (DME)
- Air traffic control (ATC) transponder
- Automatic dependent surveillance-broadcast (ADS-B)
- Doppler
- Airborne collision avoidance system (ACAS)
- Displays, indicators, control boxes, antennae, waveguides, transmitters and receivers, and line replaceable units (LRUs)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – developed from MEA232C Test and troubleshoot aircraft pulse systems and components - not equivalent

Assessment Requirements for MEA232 Test and troubleshoot aircraft pulse systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the pulse system being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, and attaching hardware (including cabling/harnesses/transmission lines) and security in:
 - radar (navigation/weather) components and interface
 - ACAS components and interface
 - radio altitude components and interface
 - DME components and interface
 - ATC transponders
 - ADS-B
 - doppler navigation system
- applying logic processes, taking and interpreting system measurements to accurately and effectively isolate malfunctions within the systems
- performing system testing to isolate system malfunctions and assess systems post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the pulse system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to testing and troubleshooting is essential. This is to be demonstrated through application across a range of aircraft pulse systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- explaining the basic layout (block diagram level), function and operation of:
 - radar (navigation/weather) components and interface
 - ACAS components and interface
 - radio altitude components and interface
 - distance measuring equipment components and interface
 - ATC transponders
 - ADS-B
 - doppler navigation system
- explaining basic principles/functions relating to the above systems and associated with:
 - basic alternating current (AC) and direct current (DC) circuit theory
 - digital fundamentals
 - analogue fundamentals
 - radar fundamentals
 - transmission lines, waveguide and antenna characteristics
- pulse system maintenance requirements and troubleshooting procedures
- relevant WHS practices, including those relating to ground functional testing of radar systems
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least three (3) of the following systems:
 - navigation radar

- weather radar
 - RADALT
 - DME
 - ATC transponder
 - ADS-B
 - doppler
 - ACAS
- and on at least one (1) item from:
 - displays, indicators, control boxes, antennae, waveguides, transmitters and receivers, and line replaceable units (LRUs).
 - This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
 - Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
 - Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
 - Individuals being assessed who have already attained either or both of MEA220 Inspect, test and troubleshoot aircraft primary radar systems and components, and MEA221 Inspect, test and troubleshoot aircraft secondary radar systems and components, will have covered Element 1 and will also have covered a significant proportion of the Performance Criteria for Elements 2 and 3 and will have covered Range of Conditions variables applicable to the unit. The Log of Industrial Experience and Achievement records relating to MEA220 Inspect, test and troubleshoot aircraft primary radar systems and components and MEA221 Inspect, test and troubleshoot aircraft secondary radar systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

MEA233 Inspect, test and troubleshoot aircraft inertial navigation and reference systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot inertial navigation and reference systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207 Remove and install aircraft electronic system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Inspect inertial navigation and reference systems and components | 1.1 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.2 Inertial navigation and reference system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Defects are correctly identified and reported |
| 2. Test/adjust inertial navigation and reference systems and components | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Inertial navigation and reference system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Prepare for troubleshooting | 3.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify an unserviceability |
| 4. Troubleshoot inertial navigation and reference systems | 4.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | 4.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replaceable level |
| | 4.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 4.4 Inertial navigation and reference system faults are located and the causes of the faults are clearly |

identified and correctly recorded in maintenance documentation, where required

4.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA233C Inspect, test and troubleshoot aircraft inertial navigation and reference systems and components

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA233 Inspect, test and troubleshoot aircraft inertial navigation and reference systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to inertial navigation and reference systems being maintained
- recognition of system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in inertial navigation and reference system components
- applying logic processes, take and interpret system measurements, use test equipment and appropriate wiring diagrams and manuals to isolate system malfunctions
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the pulse system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across an inertial navigation and reference system and its components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware
- the basic layout (block diagram level), function and operation of inertial navigation and reference systems
- the operating principles of inertial navigation and reference systems:

- terminology
- fundamental principles of inertial navigation
- two degree of freedom systems
- semi-analytical systems
- strapdown systems
- ring laser gyroscopes
- the various methods of navigation and how they are used by both aircraft conventional and electronic navigational instruments and systems
- maintenance requirements and troubleshooting procedures
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on an inertial navigation system and at least one (1) major system component/line replacement unit (LRU). This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA234 Inspect, test and troubleshoot aircraft global navigation systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot global navigation systems (GNS) and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA206	Remove and install basic radio communication and navigation system components
MEA207	Remove and install aircraft electronic system components
MEA246	Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----------------------------------|---|
| 1. Inspect GNS and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 GNS components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust GNS and components | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 GNS is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot GNS | 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replaceable level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 GNS faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures |

3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA234C Inspect, test and troubleshoot aircraft global navigation systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA234 Inspect, test and troubleshoot aircraft global navigation systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the GNS being maintained
- recognition of system and component defects/external damage, correct installation, attaching hardware (including cabling/harnesses/transmission lines) and security in global navigation systems
- applying logic processes, taking and interpreting system measurements to accurately and effectively isolate malfunctions within GNS
- performing system testing to isolate system faults and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the GNS being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- GNS principles, including the use of satellites for navigation
- component attachment methods
- the basic layout (block diagram level), function and operation of GNS, including interpretation of indicators and operation of controls
- basic principles/functions relating to the system and associated with:
 - electromagnetic radiation and propagation
 - basic alternating current (AC) and direct current (DC) circuit theory
 - digital fundamentals
 - analogue fundamentals

- transmitter and receiver principles
- antenna characteristics
- transmission line characteristics
- interface with other avionic systems, e.g. flight management systems
- maintenance requirements and troubleshooting procedures
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special purpose tools, and test and ground support equipment would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a GNS and, in cases where the system is not replaced as a single unit, at least one (1) major system component/line replacement unit (LRU). This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA235 Perform advanced troubleshooting in aircraft avionic maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of fundamental system/component knowledge and applicable maintenance publications and test equipment to troubleshoot faults in avionic systems of fixed and rotary wing aircraft that are beyond the bounds of maintenance manual fault diagnosis guides during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit covers competencies required to progress from an Aircraft Maintenance Engineer at Certificate IV to the granting of a B2 maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide and the Companion Volume CASA Interface.

The skills and knowledge covered by the units of competency listed in the MEA Aeroskills Training Package for Aircraft Maintenance Engineer (Avionics or Mechanical as applicable) at Certificate IV are prerequisite to the attainment of the elements of competency specified in this unit. This includes full coverage of the CASR Part 66 Avionics or Mechanical Syllabus subjects/topics listed in the Companion Volume Implementation Guide.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|----------------------|---|
| 1. Verify the defect | 1.1 Available information from flight crew, such as flight phase, aircraft configuration etc., and maintenance documentation both current and previous history, are used as necessary, to |
|----------------------|---|

- assist in fault determination
- 1.2 Inspection of the affected system is carried out to check both physical integrity and correct operation
 - 1.3 Information gained from Central Maintenance Systems is verified against physical integrity and correct operation, where applicable
 - 1.4 The effects on a system from interfaces/integration with other systems are taken into account
2. Isolate the defect
 - 2.1 Logical processes, including the application of basic principles and system knowledge and known facts, are used to augment maintenance manual fault diagnosis guides to ensure efficient and accurate troubleshooting
 - 2.2 Specialist advice is obtained, where required and/or available, to assist with the troubleshooting process
 - 2.3 Faults are located and the causes of the defects are clearly identified and correctly recorded in maintenance documentation, including any other systems disturbed, where required
 3. Determine defect rectification requirements
 - 3.1 Defect rectification requirements are determined and the necessary repair action initiated once verification and isolation of the defect are confirmed
 4. Verify defect rectification
 - 4.1 Defect is rectified in accordance with approved maintenance data
 - 4.2 All systems disturbed or accessed during troubleshooting are restored as applicable using maintenance manuals, repair schemes or approved maintenance data
 - 4.3 All checks required by approved maintenance data to ensure correct operation of all disturbed systems are performed

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Systems and related components include:

- Electrical systems
- Electronic systems
- Instrument systems
- Radio communication and navigation systems
- Autoflight systems

Troubleshooting

Troubleshooting, for the purpose of this unit, is defined as:

- the troubleshooting from first principles, of defects beyond available maintenance data in the systems of fixed or rotary wing aircraft types. Troubleshooting must be demonstrated across a range of typical systems and system components that includes but is not limited to airframes, engine(s) and other systems (and parts thereof) operated by inherently electrical, electronic, instrument or radio principles or means. Coverage is not required of specific type systems that are included in type training and practical consolidation of training (PCT) activities leading to a specific type licence rating
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA235B Perform advanced troubleshooting in aircraft avionic maintenance

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA235 Perform advanced troubleshooting in aircraft avionic maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment.

- Skill must be demonstrated in the diagnosis of faults that are beyond the coverage of maintenance manual fault diagnosis guides in simulated applications in the training environment and/or in the workplace across a representative range of systems and components as specified in the Assessment Conditions.
- The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications related to avionic systems, and where applicable other system interfaces/integration. It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical, as is the demonstrated ability to apply fundamental system theory in the logical diagnosis of complex faults.
- Evidence of transferability of skills and knowledge related to performance and supervision of inspection, testing and troubleshooting is essential. This must be demonstrated through application across a number of aircraft avionic systems, including system interfaces/integration.
-

Knowledge Evidence

For systems and components relevant to the scope of the licence/ratings sought as per CASR Parts 42, 66 and 145 Manuals of Standards, look for evidence that confirms knowledge of:

- theory related to system operation and interfaces between systems and with electrical/electronic control media to a level that will facilitate the diagnosis of faults beyond the level of maintenance manual fault diagnosis guides using reported symptoms and functional test results
- component construction and theory of operation to a level that will facilitate the diagnosis of faults beyond the level of maintenance manual fault diagnosis guides using reported symptoms and functional test results
- advanced fault diagnostic techniques
- condition monitoring and trend analysis techniques.

Assessment Conditions

- Competency is assessed in the workplace or simulated workplace and shall involve successfully dealing with a number of maintenance and fault scenarios across a range of avionic systems and related system components of:
 - electrical systems
 - electronic systems
 - instrument systems
 - radio communication and navigation systems
 - autoflight systems
- The troubleshooting approach should clearly demonstrate an in-depth knowledge of underpinning theory of a system, with this knowledge being used in a logical process to augment and extend the scope of the aircraft/system fault-finding guide. The fault rectification work plan should take account of applicable safety (including safe handling of heavy components) and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision without intervention and the ability has been demonstrated to identify the causes of defects not covered fully by maintenance manual fault diagnosis guides. Competency shall be assessed via simulated activities at the CASR Part 147 Maintenance Training Organisation and through performance during observed workplace activities.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA238 Perform routine removal and installation of miscellaneous aircraft electrical hardware/components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and relevant maintenance publications and documentation to remove and install a range of electrical components and electrical hardware under the guidance of a qualified person, including both on and off-aircraft work during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate II training pathway. It covers the competencies required for the removal and installation under qualified person guidance of a range of aircraft electrical components and items of hardware that can have bolted, soldered or plug connections.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Prepare to remove aircraft electrical hardware | 1.1 The removal task is planned under qualified person guidance using applicable maintenance documentation and enterprise procedures |
| | 1.2 System safety is confirmed with the qualified person |
| 2. Remove aircraft electrical hardware | 2.1 Physical removal of electrical hardware is carried out in accordance with enterprise procedures and applicable maintenance documentation while observing all relevant work health and safety (WHS) requirements |
| 3. Complete aircraft electrical hardware removal process | 3.1 Required documentation is accurately completed and correctly processed in accordance with enterprise procedures |
| | 3.2 Removed components are tagged, packaged or discarded in accordance with specified procedures |
| 4. Prepare to install aircraft electrical hardware | 4.1 The installation task is planned under qualified person guidance using applicable maintenance documentation and enterprise procedures |
| | 4.2 Electrical hardware components to be installed are checked to confirm correct part numbers |
| 5. Install aircraft electrical hardware | 5.1 Physical installation of electrical hardware is carried out in accordance with enterprise procedures and applicable maintenance documentation |
| 6. Complete aircraft electrical hardware installation process | 6.1 Required documentation is accurately completed and correctly processed in accordance with enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Electrical hardware includes:

- Switches, relays, lamps, terminal blocks, current limiters, circuit breakers, fuses, sockets, potentiometers, capacitors, inductors, magnetic amplifiers, transformers, rheostats, resistors and diodes, miscellaneous sensors and minor components hard mounted throughout the aircraft, busbars, lugs, ferrules, splices, connectors, and electrical, electronic cables and looms
- Oxygen systems and components, and fuel tank components and integrated hardware are not included

Unit Mapping Information

Release 1 – equivalent to MEA238B Perform routine removal and installation of miscellaneous aircraft electrical hardware/components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA238 Perform routine removal and installation of miscellaneous aircraft electrical hardware/components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using enterprise procedures, applicable maintenance documentation and aircraft publications relating to the electrical system and components being worked on
- the preparation and termination of electrical cables to aircraft industry standards, using:
 - crimping techniques
 - soldering techniques
 - solder sleeve joints
- the correct identification of aircraft wire markings, terminal block identification and plug/socket pin numbering systems
- electrical loom and harness installation ensuring minimum bends are maintained, cable is not in tension, plugs are correctly aligned, security of route ensures no chaffing of insulation, adequate clipping and cable ties have been utilised and construction complies with aircraft industry standards
- positive identification of miscellaneous electrical hardware and/or components.

The underlying skills inherent in this unit should be transferable into other units that require similar techniques. It is essential that applicable cleanliness requirements and WHS safety precautions are fully observed, and an awareness of electrostatic discharge procedures.

Evidence of transferability of skills and knowledge related to enterprise procedures associated with removal and installation is essential.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- electrostatic discharge procedures
- connection of hardware, plugs and terminals points
- wire marking, terminal block identification and plug/socket numbering systems.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance manuals. It is also expected that applicable general-purpose tools, and test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware and system operation as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under qualified person guidance on a range of the electrical components/hardware listed in the Range of Conditions that are applicable to the enterprise. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
-

ME A239 Fabricate aircraft electrical looms and harnesses

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and maintenance publications in aircraft hangars and workshops to fabricate aircraft electrical looms and harnesses under qualified person guidance for general use in electrical systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate II training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

ME A101	Interpret work health and safety practices in aviation maintenance
ME A103	Plan and organise aviation maintenance work activity
ME A105	Apply quality standards applicable to aviation maintenance processes
ME A107	Interpret and use aviation maintenance industry manuals and specifications
ME A108	Complete aviation maintenance industry documentation
ME A109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Prepare to fabricate aircraft electrical looms and harnesses | 1.1 Appropriate materials, tools and equipment are selected and prepared for the particular task in accordance with applicable maintenance documentation, enterprise procedures and under qualified person guidance |
| | 1.2 Assembly or fabrication jigs, where applicable, are aligned to ensure accurate fabrication of components |
| 2. Fabricate aircraft electrical looms and harnesses | 2.1 Components or parts are fabricated in accordance with qualified person guidance, applicable maintenance documentation and enterprise procedures while observing all relevant work health and safety (WHS) requirements |
| 3. Perform routine tests on aircraft electrical looms and harnesses | 3.1 Under qualified person guidance test equipment and/or rigs are used, where applicable, to confirm serviceability of finished components |
| 4. Complete the fabrication process with regard to aircraft electrical looms and harnesses | 4.1 Fabricated components are tagged, sealed and packaged within specified procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Components or parts include:

- Electrical looms, harnesses and cables **except** for:
 - data bus cables

- co-axial cables
- fibre optic cables
- fire detection/extinguishing systems
- oxygen systems
- fuel tanks and integrated hardware

Unit Mapping Information

Release 1 – equivalent to MEA239B Fabricate aircraft electrical looms and harnesses

Links

Companion Volume implementation guides are found in VETNet -
<https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA239 Fabricate aircraft electrical looms and harnesses

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved fabrication procedures and processes relating to electrical looms, cables, and harnesses
- recognising the integrity/security of electrical component crimps, joints and plug/connector pins
- fabricating cables, harnesses and looms, including wire marking, to approved industry standards
- under qualified person guidance performing testing to assess post-construction serviceability according to enterprise procedures.

The underlying skills inherent in this unit should be transferable into other areas that require similar techniques. It is essential that the general aspects of material specification and selection, measurement and fabrication be related to specific aircraft component applications to the extent necessary to unambiguously understand expert guidance.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- electrical wire gauges and standards
- wire marking conventions and procedures
- wire terminations, soldering and crimping.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified by aircraft in the maintenance manuals. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.

- Evidence of knowledge about individual components and their links with systems will be necessary to supplement evidence of ability to interpret qualified person guidance and enterprise procedures to fabricate looms, harnesses and cables before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- Safety precautions applicable to the manufacturing of electrical looms, harnesses and cables are to be fully observed. An understanding of system operation as it relates to the work must be demonstrated before undertaking any action, to ensure safety and quality issues are addressed.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under qualified person guidance on a representative range of electrical loom, cable and harness fabrication tasks with the exception of the items listed in the Range of Conditions. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA240 Use electrical test equipment to perform basic electrical tests

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills in the use of electrical test equipment under qualified person guidance to measure voltage and current, and to test continuity, insulation and bonding on aircraft and components both in the hangar and workshop during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate II training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Prepare test equipment to perform basic electrical tests | 1.1 Appropriate electrical test equipment is selected and confirmed with a qualified person |
| | 1.2 Test equipment is checked for serviceability and applicable leads are fitted, where required |
| | 1.3 Applicable function and range of measurement is set and confirmed with a qualified person |
| 2. Test component in accordance with enterprise procedures using electrical test equipment | 2.1 Test points and polarity are determined |
| | 2.2 Required parameters are measured with the test equipment while observing all relevant work health and safety (WHS) requirements |
| | 2.3 Results are recorded in accordance with enterprise procedures, under qualified person guidance |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Required parameters include measurement/testing of:

- Volts and amps
- Continuity, resistance and insulation
- Bonding

Unit Mapping Information

Release 1 – equivalent to MEA240B Use electrical test equipment to perform basic electrical tests

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA240 Use electrical test equipment to perform basic electrical tests

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- setting up applicable test equipment
- determining test points and polarity
- measuring required parameters
- recording results under qualified person guidance.

The underlying skills inherent in this unit should be transferable into all areas that require the use of basic electrical test equipment. It is essential that the general aspects of electrical test equipment identification, preparation for use and safe application to a representative range of measurement and testing tasks are clearly demonstrated.

Evidence of knowledge about the preparation and use, in accordance with enterprise procedures, of the range of test equipment used for the measurement and testing tasks listed in the Range of Conditions, and of the methods used to identify applicable polarity and connection to components and circuits for required measurement or testing.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the range of relevant electrical test equipment used to measure or test:
 - volts and amps
 - continuity, resistance and insulation
 - bonding
- identification methods used to confirm test equipment is serviceable and current regarding calibration
- use of selectors and scale adjustment of each item of test equipment to ensure accurate measurement of applicable parameter
- methods of connection of test equipment to components being tested
- methods used to determine polarity and applicable connection points for measurement or testing.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using relevant electrical test equipment as specified in maintenance documentation for a given task, and in accordance with enterprise procedures under expert guidance.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under qualified person guidance on a representative range of electrical measurement and testing tasks as provided for in the Range Statement. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA241 Perform aircraft weight and balance calculations as a result of modifications

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of mathematical formulae to calculate the weight and balance effect of components installed in fixed and rotary wing aircraft during modification incorporation and may involve individual activities or supervision of other personnel.

The unit covers competencies required to progress from an Aircraft Maintenance Engineer at Certificate IV to the granting of a B2 Aircraft Maintenance Engineer Licence in the Avionics category under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide and the Companion Volume CASA Interface.

The skills and knowledge covered by the units of competency listed in the MEA Aeroskills Training Package for Aircraft Maintenance Engineer (Avionics or Mechanical as applicable) at Certificate IV are prerequisite to the attainment of the elements of competency specified in this unit.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | |
|--|-----|--|
| 1. Calculate the weight and balance impact of a modification | 1.1 | The requirement for aircraft weighing is determined |
| | 1.2 | The new empty weight of the aircraft is determined and it is ensured that the weight is within the |

predetermined limits set by the Continuing Airworthiness Management Organisation (CAMO)

- 1.3 The new empty weight centre of gravity of the aircraft is calculated using the weight and moment arm data for a modification and it is ensured that the centre of gravity is within the predetermined limits set by the CAMO
- 1.4 Maintenance records are updated with new figures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA241C Perform aircraft weight and balance calculations as a result of modifications

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA241 Perform aircraft weight and balance calculations as a result of modifications

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- calculating the effect on aircraft weight and centre of gravity of components installed during modification incorporation using weight and moment arm data.

The underlying skills inherent in this unit should be transferable across a range of aircraft types. Ability to interpret the instructions for configuring and weighing aircraft is critical.

Evidence of transferability of skills and knowledge related to aircraft weight and calculation of centre of gravity is essential

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- mathematical formulae used to calculate centre of gravity of an aircraft.

Assessment Conditions

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision without intervention.
- This shall be established via simulated activities at the CASR Part 147 Maintenance Training Organisation and performance during observed workplace activities.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA246 Fabricate and/or repair aircraft electrical hardware or parts

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and knowledge of wiring standards and specifications to fabricate aircraft electrical looms, harnesses and cables in aircraft maintenance hangars and workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of all Avionic Certificate IV training pathways. It is also part of the Mechanical Aircraft Maintenance Engineer licensing pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA201 Remove and install miscellaneous aircraft electrical hardware/components

MEA260 Use electrical test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Interpret specifications and organise materials | 1.1 Specifications are interpreted to determine the dimensions and procedure for fabrication |
| | 1.2 Appropriate materials, tools and equipment are selected and prepared for the particular specification requirements |
| 2. Fabricate/repair electrical components or parts | 2.1 Assembly or fabrication jigs, where applicable, are aligned to ensure accurate fabrication of components |
| | 2.2 Components or parts are fabricated in accordance with required specifications while observing all relevant work health and safety (WHS) requirements including the use of material safety data sheets (MSDS) and personal protective equipment (PPE) |
| 3. Test fabricated/repairs components or parts | 3.1 Test equipment and/or rigs are used, where applicable, to confirm serviceability of finished components |
| | 3.2 Fabricated components are tagged, sealed and packaged within specified procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Components or parts include:

- Electrical looms, harnesses and cables associated with:
 - power distribution
 - ignition

- Procedures and requirements include:**
- control circuits
 - signal circuits
 - Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA246C Fabricate and/or repair aircraft electrical hardware or parts

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA246 Fabricate and/or repair aircraft electrical hardware or parts

Modification History

Release 1 - New unit of competency

Performance Evidence

- Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:
- applying relevant WHS practices, including the use of PPE and reference to MSDS
- using approved repair/fabrication procedures and processes relating to electrical cables, harnesses, antenna leads and aerial components
- recognising the integrity/security of electrical component crimps, wire wrapping, joints, and plug/connector pins
- constructing cables, harnesses and looms, including wire marking, to approved industry standards
- performing component testing to assess post-construction serviceability.

The underlying skills inherent in this unit should be transferable into other areas that require similar techniques. It is essential that the general aspects of material specification and selection, measurement and fabrication/manufacture are related to specific aircraft component applications.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component and system operation
- aircraft wiring specifications and standards
- standard repair methods for:
 - electrical cables
 - ignition harnesses
 - fire warning system harnesses
 - coaxial cables, such as antenna leads
 - aerial components
- electrical plugs and connectors
- soldering methods
- fabrication methods for the above wiring and cables
- wire marking methods

- assembly of electrical cables into wiring looms
- relevant WHS procedures
- how to obtain relevant MSDS
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified by aircraft in the maintenance manuals. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- Evidence of knowledge about individual components and their links with systems will be necessary to supplement evidence of ability to interpret requirements and fabricate components before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of tasks, including:
 - power distribution
 - ignition
 - control circuits
 - signal circuits.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA252 Test, align and troubleshoot aircraft synchro and servo system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, test equipment and knowledge of analogue theory to test, align and troubleshoot synchro and servo components, from fixed and rotary wing aircraft, that are repaired or overhauled in aviation maintenance workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Component Maintenance Workshop Stream) training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA201	Remove and install miscellaneous aircraft electrical hardware/components
MEA260	Use electrical test equipment
MEA261	Use electronic test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.	demonstrate achievement of the element.
1. Test synchro and servo system components	<p>1.1 Synchro and servo system components are correctly prepared and connected to the appropriate test equipment/rig in accordance with approved procedures</p> <p>1.2 Components are functionally tested or cycled through the prescribed test procedures in accordance with maintenance manual for evidence of serviceability or malfunction while observing all relevant work health and safety (WHS) requirements</p> <p>1.3 Faults or unserviceabilities are correctly identified and recorded on appropriate maintenance documentation</p>
2. Align synchro and servo system components	<p>2.1 Synchro and servo system components are adjusted in accordance with approved procedures and maintenance manuals until operating within prescribed limits/tolerances</p>
3. Troubleshoot synchro and servo system components	<p>3.1 Available information from maintenance records and inspection and test results is used, where necessary, to assist in fault determination</p> <p>3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting</p> <p>3.3 Synchro and servo system component faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required</p> <p>3.4 Fault rectification requirements are determined</p>

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Component testing, alignment and troubleshooting is performed on:

- Synchro system components
- Servo system components

Synchro and servo system components can come from any of:

- Air data computers, auto pilot servos, remote position indicators and other similar applications
-

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA252B Test, align and troubleshoot aircraft synchro and servo system components

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA252 Test, align and troubleshoot aircraft synchro and servo system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved repair procedures and processes relating to synchro and servo system components
- recognising the serviceability state and repair requirements for:
 - synchro/servo system error detection devices
 - direct current (DC) and alternating current (AC) synchronous components
 - gyroscopic instruments (mechanical, electro-mechanical, vacuum/pressure types)
 - flight control servo devices
- performing component testing to isolate/confirm faults and assessing post-repair/overhaul serviceability
- correctly aligning synchro and servo system components to prescribed specifications
- applying logic processes to isolate synchro and servo system component faults.

The underlying skills inherent in this unit should be transferable across a range of testing, aligning and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with synchro and servo system components. Ability to interpret inspection and testing procedures and specifications (allowable limits) and apply them in practice is critical. It is essential that testing procedures, cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with.

This must be demonstrated through application across a range of the synchro and servo system components listed in the Assessment Conditions that are applicable to the enterprise.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component and system operation

- the basic function and operation of synchro and servo system components to enable testing for fault isolation/confirmation and to determine repair or overhaul requirements and serviceability status post-repair or overhaul
- basic principles/functions, relating to synchro and servo system components and associated with:
 - advanced analogue fundamentals
 - synchronous systems
 - gyroscopes.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that general and special-purpose tools and test equipment would be used where appropriate.
- The application of testing procedures should also clearly indicate knowledge of system operation. System operation knowledge, the relationship of individual components and the links with other systems (if applicable) will be necessary to supplement evidence of ability to troubleshoot the component within the limits of the fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of components applicable to the enterprise from each of:
 - synchro system components
 - servo system components.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA260 Use electrical test equipment

Modification History

Release 2 - Phase angle measurement (in Range of Conditions) now dependent on enterprise need

Release 1 - New unit of competency

Application

This unit of competency requires application of skills in the use of electrical test equipment to measure voltage, current, frequency and phase angle, and to test continuity, resistance, insulation and bonding.

Applications include aircraft and components both in the hangar and workshop during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of all Avionic Certificate IV training pathways. It is also part of the Mechanical Aircraft Maintenance Engineer licensing pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications

- MEA108 Complete aviation maintenance industry documentation
- MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----------------------------------|---|
| 1. Select required test equipment | 1.1 System/component test requirements are identified |
| | 1.2 Appropriate test equipment is selected |
| 2. Prepare test equipment for use | 2.1 Test equipment is checked for serviceability and applicable leads are fitted where required |
| | 2.2 Applicable function and range of measurement is selected as required |
| 3. Test system or component | 3.1 Test points and polarity are determined |
| | 3.2 Required parameters are measured with the test equipment while observing all relevant work health and safety (WHS) requirements |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

System/component test requirements include:

- Measurement of or testing:
 - volts, amps and power
 - frequency
 - phase angle (where applicable to the enterprise)
 - continuity, resistance and insulation
 - bonding

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 2 - phase angle measurement (in Range of Conditions and Assessment Requirements) now dependent on enterprise need. No change in outcome

Release 1 – equivalent to MEA260B Use electrical test equipment

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA260 Use electrical test equipment

Modification History

Release 2 - Phase angle measurement (in Assessment Conditions) now dependent on enterprise need

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using selectors and scale adjustment of each item of test equipment to ensure accurate measurement of applicable parameter
- connecting test equipment to components or circuits
- determining polarity and applicable connection points for measurement or testing.

The underlying skills inherent in this unit should be transferable into all areas which require the use of electrical test equipment. It is essential that the general aspects of electrical test equipment selection, preparation for use and safe application to a representative range of measurement and testing tasks are clearly understood.

Evidence is required of knowledge about the selection and use of the range of test equipment used for the measurement and testing tasks listed in the Range of Conditions, and of the methods used to identify applicable polarity and connection to components and circuits for required measurement or testing.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the range of electrical test equipment used to measure or test:
 - volts, amps and power
 - frequency
 - phase angle
 - continuity, resistance and insulation
 - bonding
- test equipment construction and calibration, and testing for serviceability.

Assessment Conditions

- Competency should be assessed in the work environment, or simulated work environment, using electrical test equipment specified in maintenance documentation. It is also expected that applicable test equipment can be selected on the basis of general trade knowledge where specific test equipment is not specified.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision in the selection of appropriate items of test equipment and their use to perform the measurements and test each of:
 - volts, amps and power
 - frequency
 - phase angle (may be omitted if not relevant to the enterprise)
 - continuity, resistance and insulation
 - bonding.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

ME A261 Use electronic test equipment

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of skills in the use of electronic test equipment to measure electronic circuit parameters and test performance.

Applications include aircraft components both in the hangar and workshop undergoing scheduled or unscheduled maintenance involving individual and team activities.

The unit is part of Avionic Certificate IV training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

ME A101	Interpret work health and safety practices in aviation maintenance
ME A103	Plan and organise aviation maintenance work activity
ME A105	Apply quality standards applicable to aviation maintenance processes
ME A107	Interpret and use aviation maintenance industry manuals and specifications
ME A108	Complete aviation maintenance industry documentation
ME A109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----------------------------------|---|
| 1. Select required test equipment | 1.1 System/component test requirements are identified |
| | 1.2 Appropriate test equipment is selected |
| 2. Prepare test equipment for use | 2.1 Test equipment is checked for serviceability and applicable leads are fitted where required |
| | 2.2 Applicable function and range of measurement is selected as required |
| 3. Test system or component | 3.1 Test points and polarity are determined |
| | 3.2 Required parameters are measured with the test equipment while observing all relevant work health and safety (WHS) requirements |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Electronic test equipment includes:

- Electronic multimeters
- Phase-angle voltmeters (where applicable to the enterprise)
- Oscilloscopes (dual differential, differential, delayed time base, storage)
- Current probes
- Logic and discrete component testers
- Electronic component substitution boxes and

- Procedures and requirements include:**
- miscellaneous test adapters
 - Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA261C Use electronic test equipment

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA261 Use electronic test equipment

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- connecting test equipment to components or circuits
- determining polarity and applicable connection points for measurement or testing.

The underlying skills inherent in this unit should be transferable into all areas that require the use of electronic test equipment as listed in the Range of Conditions. It is essential that the general aspects of electronic test equipment selection, preparation for use and safe application to a representative range of measurement and testing tasks are clearly understood.

Evidence is required of knowledge about the selection and use of the range of test equipment listed in the Range of Conditions, and of the methods used to identify applicable polarity and connection to components and circuits for required measurement or testing.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the construction, calibration for use and testing for serviceability of:
 - electronic multimeters
 - phase-angle voltmeters
 - oscilloscopes (dual differential, differential, delayed time base and storage)
 - current probes
 - logic and discrete component testers
 - electronic component substitution boxes and miscellaneous test adapters
- use of selectors and scale adjustment of each item of test equipment to ensure accurate measurement of applicable parameters
- high speed oscilloscope techniques, probe calibration and safety precautions.

Assessment Conditions

- Competency should be assessed in the work environment, or simulated work environment, using electronic test equipment specified in maintenance documentation. It is also expected that applicable test equipment can be selected on the basis of general trade knowledge where specific test equipment is not specified.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision, with each item of test equipment having been used to measure electronic circuit parameters and test performance:
 - electronic multimeters
 - phase-angle voltmeters (may be omitted where not applicable to the enterprise)
 - oscilloscopes (dual differential, differential, delayed time base, storage)
 - current probes
 - logic and discrete component testers
 - electronic component substitution boxes and miscellaneous test adapters.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA262 Modify/repair aircraft component single layer printed circuit boards

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, including high reliability hand soldering, and knowledge of standard practices and techniques in the repair of single layer printed circuit boards from aircraft avionic components that are repaired in aviation workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA260 Use electrical test equipment

MEA261 Use electronic test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Inspect single layer printed circuit cards and associated components | 1.1 Relevant maintenance documentation, including component defect reports, where applicable, is interpreted and matched by part and serial number |
| | 1.2 Preparation of work area and circuit card assemblies is appropriate to allow for effective detailed inspection of |

- all substrate, circuit tracks, edge connectors and attached components, taking into account any static discharge procedures
- 1.3 Circuit card assemblies are visually or physically inspected for physical integrity of substrate, circuit tracks, edge connectors and attached components
 - 1.4 Modification status is established to assist in determining repair requirements
 - 1.5 Defects are correctly identified and reported
2. Test single layer printed circuit cards and associated components
 - 2.1 Circuit card assemblies are correctly prepared and connected to the appropriate test facility in accordance with approved procedures, or circuit card assemblies are correctly prepared and connected in situ to allow required test procedures to be performed
 - 2.2 Circuit card assemblies are functionally tested in accordance with normal trade practice and approved maintenance documentation for evidence of serviceability or malfunction
 - 2.3 Circuit card assemblies, attached hardware and electronic components are electronically and/or physically adjusted/aligned in accordance with maintenance manuals or other prescribed procedures
3. Troubleshoot single layer printed circuit cards and associated components
 - 3.1 Maintenance documentation, physical inspection and test results are used, where applicable, to assist in fault determination
 - 3.2 Maintenance manual fault diagnosis guides, logical processes and test equipment are used appropriately to ensure efficient and accurate troubleshooting
 - 3.3 Component faults are located and the causes of the faults are clearly identified and recorded in maintenance documentation, where required
 - 3.4 Rectification requirements are determined
4. Dismantle single layer printed circuit cards and associated components
 - 4.1 Conformal/protective coatings are removed from the circuit card assembly to the extent required to effect necessary repairs and in accordance with maintenance manuals, and industry or enterprise standards as applicable

- 4.2 Appropriate work health and safety (WHS) requirements are observed at all times during maintenance procedures and applicable material safety data sheets (MSDS) and personal protective equipment (PPE) are used
 - 4.3 Circuit card assembly is dismantled to the extent necessary to allow repair of all identified faults
 - 4.4 Parts for processing are correctly tagged and despatched
 - 4.5 Parts for retention and re-fitment are correctly packaged and stored in accordance with approved procedures to avoid physical and electrostatic damage
 - 4.6 Parts for disposal are correctly packaged and processed to accord with statutory requirements pertaining to dangerous goods
5. Assemble single layer printed circuit cards and associated components
 - 5.1 Parts removed for access, and replacement parts, are collected ensuring appropriate modification status, component tolerances and assembly configuration is maintained
 - 5.2 Printed circuit card and associated components are assembled in accordance with maintenance manuals, and all electrical joints meet the approved standard of the equipment manufacturer, or industry standard, as appropriate
 - 5.3 Circuit substrate material, circuit tracks, edge connectors and through-hole eyelets are reworked, as necessary, to restore printed circuit card to a serviceable condition
 - 5.4 Any conformal/protective coatings removed are replaced to the approved standard of the equipment manufacturer, or industry standard, as appropriate
 - 5.5 Rework techniques are in accordance with industry approval procedures and relevant WHS precautions are observed and applicable MSDS and items of PPE are used

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Circuit card components include:

- Capacitors, resistors, wires, semiconductors, inductors, transformers, switches, connectors, multi-pin ICs, terminal posts and heat-sink materials, and will include electrostatic sensitive devices

Procedures and standards include:

- Procedures and standards for repair of printed circuit card assemblies, including a range of general engineering hand skills in addition to specific high reliability soldering skills.
- Standards applicable in a given situation will be defined by equipment manufacturers and/or regulatory authorities and the enterprise

Assessment Requirements for MEA262 Modify/repair aircraft component single layer printed circuit boards

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- applying relevant WHS practices including the selection and use of PPE and the use of MSDS
- using approved repair procedures and processes relating to single and double sided circuit cards
- recognising unacceptable soldered connections, damage circuit card components, circuit tracks integrity, substrate damage and edge connector condition
- applying static-safe work area practices
- reworking unacceptable printed circuit board soldered connections, via acceptable de-soldering and soldering techniques
- disassembling and assembling printed circuit board cards to approved industry standards and prescribed specifications
- performing printed circuit board tests using relevant test equipment and processes to isolate printed circuit board track faults and assess serviceability state post repair
- correctly disassembling, preparing repair area, reworking the card to industry standards, replacing faulted components and assembling card for post-repair inspection and testing.

It is essential that substrate abrasion and rebuilding techniques and precautions associated with handling and assembly of electrostatic and temperature sensitive devices are fully observed, understood and complied with. A high level of awareness of safety precautions associated with beryllium materials and use of fluxes and solvents is to be demonstrated.

Evidence of transferability of skills and knowledge related to single layer printed circuit card assembly and repair is essential before undertaking any action. This may be demonstrated through application of the techniques involved across a representative range of circuit card substrate materials and attached components. Use of high precision, high reliability soldering techniques and handling of components, including application of anti-static equipment, must be demonstrated.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component operation
- basic principles/functions relating to electrical and electronic components on printed circuit boards
- substrate materials
- types of conformal coating
- types of soldering equipment and solders used in track repair and component assembly
- how to obtain MSDS
- WHS procedures
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance manuals. It is also expected that applicable general and special-purpose test equipment found in most routine situations would be used where appropriate.
- The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of cards with various substrate materials and components. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA263 Modify/repair aircraft component multi-layer printed circuit boards

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills (including those required to gain access to inner layers and repair outer layers after track repair), including high reliability hand soldering, and knowledge of standard practices and techniques in the repair of multi-layer printed circuit boards from aircraft avionic components that are repaired in aviation workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

This unit is part of the Avionic Certificate IV training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA260	Use electrical test equipment
MEA261	Use electronic test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect multi-layer printed circuit cards | 1.1 Relevant maintenance documentation, including component defect reports where applicable, is interpreted |
|--|---|

- and associated components

MEA264 Remove and install aircraft electrical/avionic components during line maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the removal and installation from fixed and rotary wing aircraft of a limited range of aircraft electrical and avionic system components that are within the privileges of the Aircraft Maintenance Engineer A Licence during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

It is one of the units required for the granting of the chosen Aircraft Maintenance Engineer A Licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA265 Remove and install general aircraft electrical hardware

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Remove aircraft electrical system components

1.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety

1.2 Electrical component removal is carried out in accordance with the applicable maintenance manual while observing

- all relevant work health and safety (WHS) requirements
 - 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 1.4 Removed components are tagged and packaged in accordance with specified procedures
- 2. Remove avionic system components
 - 2.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
 - 2.2 Avionic component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements
 - 2.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 2.4 Removed components are tagged and packaged in accordance with specified procedures
- 3. Install aircraft electrical system components
 - 3.1 Electrical components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
 - 3.2 Physical installation of electrical components is performed in accordance with the applicable maintenance manual ensuring appropriate adjustment/alignment with mechanical interface is carried out
 - 3.3 System is reinstated to correct operational condition in preparation for testing, as necessary
 - 3.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
- 4. Install avionic system components
 - 4.1 Avionic components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
 - 4.2 Physical installation of electrical components is performed in accordance with the applicable maintenance manual ensuring appropriate adjustment/alignment with mechanical interface is carried out

- 4.3 System is reinstated to correct operational condition in preparation for testing, as necessary
- 4.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Electrical components include:

- Ovens, boilers and beverage makers
- Aircraft internal and external lights, filaments and flash tubes
- Aircraft main and auxiliary power unit (APU) batteries
- Static wicks

Avionic components include:

- Passenger entertainment system components but excluding public address

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA264A Remove and install aircraft electrical/avionic components during line maintenance

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA264 Remove and install aircraft electrical/avionic components during line maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures
- using maintenance publications in identifying/locating:
 - ovens, boilers and beverage makers
 - aircraft main and APU batteries (lead acid and nickel cadmium) and associated mounting equipment, including related anti-vibration aids and battery temperature monitoring systems
 - aircraft internal and external lights
 - static wicks
 - passenger entertainment system components
- correctly connecting:
 - ovens, boilers and beverage makers
 - aircraft main and APU batteries (lead acid and nickel cadmium) and associated mounting equipment, including related anti-vibration aids and battery temperature monitoring systems
 - aircraft internal and external lights
 - passenger entertainment system components
- application of standard procedures, including handling of electrostatic sensitive devices

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across the range of applicable components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- procedures for handling electrostatic sensitive devices
- relevant WHS practices
- the use of applicable maintenance documentation and aircraft publications relating to electrical and passenger entertainment systems
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance manuals. It is also expected that applicable general-purpose tools, and test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware, and the need for functional testing as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision but without intervention on at least one (1) component from each of the following groups of components:
 - ovens, boilers and beverage makers
 - aircraft internal and external lights, filaments and flash tubes
 - aircraft main and APU batteries
 - static wicks
 - passenger entertainment system components but excluding public address.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.
-

Links

Companion Volume implementation guides are found in VETNet -

MEA265 Remove and install general aircraft electrical hardware

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills in the removal and installation from fixed or rotary wing aircraft of electrical hardware, including items of general electrical hardware, that are within the privileges of the Aircraft Maintenance Engineer A Licence during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit forms part of the Civil Aviation Safety Authority (CASA) requirement for the granting of the chosen Aircraft Maintenance Engineer A Licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Remove general aircraft electrical hardware | 1.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety |
| | 1.2 Removal of electrical hardware is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| | 1.4 Removed components are tagged, packaged or discarded in accordance with specified procedures |
| 2. Install general aircraft electrical hardware | 2.1 Electrical hardware components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life |
| | 2.2 Physical installation of electrical hardware is carried out in accordance with the applicable maintenance manual |
| | 2.3 System is reinstated to correct physical condition in preparation for testing, as necessary |
| | 2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Removal and installation of electrical hardware includes one or more of the following connection methods:

- Bolted
- Plug connectors

Electrical hardware includes:

- Switches
- Relays
- Lamps
- Terminal blocks
- Current limiters
- Circuit breakers
- Fuses
- Sockets
- Potentiometers
- Capacitors
- Inductors
- Magnetic amplifiers
- Transformers
- Rheostats
- Miscellaneous sensors and minor components hard mounted throughout the aircraft
- Busbars
- Lugs
- Ferrules
- Splices
- Connectors and electrical, electronic cables and looms
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA265A Remove and install general aircraft electrical hardware

Assessment Requirements for MEA265 Remove and install general aircraft electrical hardware

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures
- using approved maintenance documentation and aircraft publications relating to miscellaneous aircraft electrical hardware and components
- recognising defects in and deterioration of electrical cables to aircraft industry standards, including crimped and soldered joints
- correctly interpreting aircraft wire markings, terminal block identification and plug/socket pin numbering systems
- inspecting electrical looms and harness pre and post-removal and installation to ensure minimum bends are maintained, cable is not in tension, plugs are correctly aligned, security of route ensures no chaffing of insulation, adequate clipping and cable ties have been utilised and construction complies with aircraft industry standards
- positive identification of miscellaneous electrical hardware and/or components in all aircraft systems
- plug connector pin removal and insertion.

It is essential that applicable cleanliness requirements and WHS precautions are fully observed, including awareness of electrostatic discharge procedures.

Evidence of transferability of skills and knowledge related to removal and installation is essential.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- relevant WHS procedures
- electrical wiring used in aircraft and wire marking
- plug/socket pin numbering and terminal block identification
- cable and loom installation requirements

- crimping tools and crimp terminals
- procedures for removal and insertion of plug connector pins
- electrical fundamentals and related mathematical and physics principles.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in maintenance manuals. It is also expected that applicable general-purpose tools, and test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware and system operation as they relate to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision but without intervention on each of the following connection methods:
 - bolted
 - plug connectors
- and on a range of the hardware/components listed in the Range of Conditions:
 - switches, relays, lamps, terminal blocks, current limiters, circuit breakers, fuses, sockets, potentiometers, capacitors, inductors, magnetic amplifiers, transformers, rheostats, miscellaneous sensors and minor components hard mounted throughout the aircraft, busbars, lugs, ferrules, splices, connectors and electrical, electronic cables and looms.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.
-

ME A266 Terminate and repair aircraft optical fibre cable

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and knowledge of aircraft optical fibre cable termination and repair methods in aircraft maintenance hangars and workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of all Avionic Certificate IV training pathways. The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes	Performance criteria describe the performance needed to demonstrate achievement of the element
1. Prepare to terminate or repair aircraft optical fibre cable	1.1 The system is isolated and it is confirmed that the optical source is not transmitting
	1.2 The requirement to terminate or replace an existing termination is confirmed from maintenance data
	1.3 The extent of damage is identified
	1.4 Equipment required for compliance with work health and safety (WHS) requirements is assembled and required personal protective equipment (PPE) is

			obtained and worn during termination and/or repair activities
		1.5	Required tools, optical connectors, materials and test equipment are assembled ready for use
2.	Terminate aircraft optical fibre cable	2.1	Optical fibre cable is prepared for termination in accordance with the applicable maintenance data or manufacturer's instructions
		2.2	The specified optical connector is fitted in accordance with relevant maintenance data or manufacturer's instructions
3.	Repair aircraft optical fibre cable	3.1	The extent of damage to the optical fibre cable is determined and assessed for repair or for cable replacement
		3.2	If damage is within specified limits the repair method is determined from the applicable maintenance data
		3.3	The repair is performed in accordance with the applicable repair method while observing all applicable WHS requirements
4.	Remove fibre hazards from work area	4.1	The work area is cleaned and all waste materials are packaged and disposed of in accordance with WHS requirements and enterprise procedures
5.	Test terminated and/or repaired optical fibre cable	5.1	Terminated and/or repaired fibre optic cable is tested for loss and strength of light transmission in accordance with maintenance data or manufacturer's specifications
		5.2	Optical fibre cable is connected to light transmitter and optical receiver

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect

performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Relevant specifications and maintenance data include:

- ARINC Specification 801 Fibre Optic Connectors
- ARINC Specification 802 Fibre Optic Cables
- ARINC Specification 805 Fibre Optic Test Procedures
- ARINC Specification 806 Fibre Optic Installation and Maintenance Procedures
- CASA AC21-99 Aircraft Wiring and Bonding, Section 2 Chapter 19

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA266 Terminate and repair aircraft optical fibre cable

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- observing WHS procedures and selecting and correctly using PPE, including observance of laser safety procedures
- fitting optical connectors
- cleaning and polishing of optical connectors
- repairing optical fibre cable by splicing
- thorough clean-up of work area and correct packaging and disposal of waste
- testing of terminated and repaired optical fibre cables
- connecting optical fibre cable to the light transmitter and optical receiver.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- types of optical connector
- materials and procedures for cleaning and polishing optical connectors
- tools and materials used for fitting optical connectors
- optical fibre cable construction and characteristics, including:
 - strain relief and bend radius
 - cable installation precautions
- methods of splicing optical fibre cable
- light transmission methods and applications
- types of optical receiver
- test equipment:
 - calibrated light source and light receiver
 - power meter
 - optical time domain reflectometers
- cable inspection and testing
- AS/NZS 2211:2006 Safety of laser products (Parts 1 and 2)

- WHS procedures associated with optical fibre cable termination and repair, including laser safety procedures
- PPE required for optical fibre termination and repair
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in the applicable aircraft maintenance manuals. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- Evidence of knowledge about optical fibre data transmission systems will be necessary to supplement evidence of ability to interpret requirements and terminate and repair optical fibre cable before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of tasks, including:
 - termination of optical fibre cable using a range of connector types
 - repair of optical fibre cable.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

MEA270 Lay out avionic systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of basic knowledge of avionic system function, design and layout, including typical electrical and instrument systems, during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Avionic engineering

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Lay out to block diagram level an aircraft electrical system	1.1 The functions of aircraft electrical systems are identified
	1.2 Aircraft electrical system components are identified

- | | | | |
|----|--|-----|--|
| | | 1.3 | A typical aircraft electrical system is sketched at block diagram level |
| | | 1.4 | Aircraft electrical system maintenance requirements are identified |
| 2. | Lay out to block diagram level an instrument measuring system | 2.1 | The various instrument measuring systems are identified |
| | | 2.2 | Measuring system components are identified |
| | | 2.3 | A typical instrument measuring system is sketched at block diagram level |
| | | 2.4 | Measuring system maintenance requirements are identified |
| 3. | Lay out to block diagram level a pressurisation control system | 3.1 | Pressurisation control system components are identified |
| | | 3.2 | A typical pressurisation control system is sketched at block diagram level |
| | | 3.2 | Pressurisation control system maintenance requirements are identified |
| 4. | Lay out to block diagram level an aircraft oxygen system | 4.1 | The various types of oxygen system are identified |
| | | 4.2 | Oxygen system components are identified |
| | | 4.3 | A typical oxygen system is sketched at block diagram level |
| | | 4.4 | Oxygen system maintenance requirements are identified |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional

contexts) are included.

Functions of aircraft electrical systems include:

- Power generation, control and distribution
- Lighting
- Electrically operated systems, such as doors, flap and landing gear systems
- System control (e.g. hydraulic, pneumatic, air conditioning, propeller control and anti-skid)
- Warning systems
- Ice and rain protection
- Engine systems

Aircraft electrical system components include:

- The major components of each of the above systems that would be shown in a block diagram or schematic

Instrument measuring systems include:

- Engine indication
- Transmitter/indicator measuring (pressure, temperature and position)
- Fuel quantity indication and flow indication

Measuring system components include:

- The major components of each of the above systems that would be shown in a block diagram or schematic

Pressurisation control system components include:

- The major components of a pressurisation control system that would be shown in a block diagram or schematic.

Types of oxygen system include:

- Gaseous
- Liquid
- Chemical

Oxygen system components include:

- The major components of each of the above systems that would be shown in a block diagram or schematic

Unit Mapping Information

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA270 Lay out avionic systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- sketching typical avionic systems at block diagram level.

Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- DC and AC power generation, control and distribution
- aircraft electrical systems and their components
- aircraft electrical system maintenance requirements
- the atmosphere
- use of synchros and servos
- basics of analogue electronics
- aircraft instrument measuring systems and their components
- aircraft instrument measuring system maintenance requirements
- air conditioning and pressurisation systems
- air conditioning and pressurisation system maintenance requirements
- types of aircraft oxygen systems and their applications
- oxygen system maintenance requirements and related cleanliness and safety precautions.

Assessment Conditions

- This unit shall be assessed off the job in a training environment equipped to provide exposure to the range of system types and components. The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.

- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA271 Lay out avionic flight management systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of basic knowledge of avionic flight management systems function, design and layout including typical instrument, radio and electronic systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA101 Interpret work health and safety practices in aviation maintenance

MEA107 Interpret and use aviation maintenance industry manuals and specifications

MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

MEA270 Lay out avionic systems

Competency Field

Avionic engineering

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Lay out to block diagram level a flight

1.1 The various aircraft flight instrument systems are identified

- | | | |
|---|-----|--|
| instrument system | 1.2 | Flight instrument system components are identified |
| | 1.3 | A typical advanced flight instrument system is sketched at block diagram level |
| | 1.4 | Flight instrument system maintenance requirements are identified |
| 2. Lay out to block diagram level an instrument navigation system | 2.1 | The various instrument navigation systems are identified |
| | 2.2 | Instrument navigation system components are identified |
| | 2.3 | A typical instrument navigation system is sketched at block diagram level |
| | 2.4 | Instrument navigation system maintenance requirements are identified |
| 3. Lay out to block diagram level an aircraft communication system | 3.1 | Aircraft communication systems are identified |
| | 3.2 | Communication system components are identified |
| | 3.3 | A typical communication system is sketched at block diagram level |
| | 3.4 | Communication systems maintenance requirements are identified |
| 4. Lay out to block diagram level an aircraft pulse system | 4.1 | Aircraft pulse systems are identified |
| | 4.2 | Pulse system components are identified |
| | 4.3 | A typical pulse system is sketched at block diagram level |
| | 4.4 | Pulse system maintenance requirements are identified |
| 5. Lay out to block diagram level an aircraft radio navigation system | 5.1 | Aircraft radio navigation systems are identified |
| | 5.2 | Radio navigation system components are identified |
| | 5.3 | A typical radio navigation system is sketched at block diagram level |
| | 5.4 | Radio navigation system maintenance requirements are |

- identified
6. Lay out to block diagram level an aircraft electronic system
- 6.1 Aircraft electronic systems are identified
- 6.2 Electronic system components are identified
- 6.3 A typical electronic system is sketched at block diagram level
- 6.4 Electronic system maintenance requirements are identified

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Aircraft flight instrument systems include:

- Airspeed indication
- Pitot static systems
- Vertical speed indication
- Air data
- Machmeter
- Altimeters, including servo and encoding
- Angle of attack and stall warning/avoidance
- Turn and slip
- Directional gyros (DGs)
- Artificial horizons (AHs)
- Attitude heading reference

Flight instrument system components include:

- The major components of each of the above systems that would be shown in a block diagram or schematic

Instrument navigation systems include:

- Remote reading gyro compass
- Direct reading compass
- Ground proximity warning
- Flight data recording

- Inertial navigation
 - The major components of each of the above systems that would be shown in a block diagram or schematic
- Instrument navigation system components include:**
- Aircraft communication systems include:**
- High frequency (HF) radio
 - Very high frequency (VHF) radio
 - Ultra-high frequency (UHF) radio
 - Satellite communications
 - Communications addressing and reporting
 - Audio integration and intercommunications
 - Cockpit voice recording
 - Emergency location
- Communication system components include:**
- The major components of each of the above systems that would be shown in a block diagram
- Aircraft pulse systems include:**
- Navigation radar
 - Search radar
 - Weapons system radar
 - Radar altimeter
 - Air traffic control transponder
 - Distance measuring equipment
 - Tactical air navigation
 - Doppler
 - Collision avoidance
- Pulse system components include:**
- The major components of each of the above systems that would be shown in a block diagram
- Aircraft radio navigation systems include:**
- Instrument landing
 - Automatic direction finding
 - VHF omni range
 - Global navigation
- Radio navigation system components include:**
- The major components of each of the above systems that would be shown in a block diagram
- Aircraft electronic systems include:**
- Automatic flight control
 - Automatic engine control
 - Electronic instrument display
 - Flight management
- Electronic system components include:**
- The major components of each of the above systems that would be shown in a block diagram

Assessment Requirements for MEA271 Lay out avionic flight management systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- sketching typical avionic flight management systems at block diagram level.

Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- the atmosphere
- pitot static systems
- magnetism
- function of gyroscopes
- use of synchros and servos
- basics of analogue electronics
- aircraft instrument systems and their components
- aircraft instrument system maintenance requirements
- radio, navigation and radar basics
- aircraft communication, pulse and radio navigation systems and their components
- communication, pulse and radio navigation system maintenance requirements
- basics of digital electronics
- basic computer architecture
- use of data buses
- automatic flight control systems and their components
- automatic engine control systems and their components
- flight management systems and their components
- display systems and their components
- aircraft electronic system maintenance requirements.

Assessment Conditions

- This unit may be assessed off the job in a training environment equipped to provide exposure to the range of system types and components. The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, supervisor's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA274 Maintain basic light aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the maintenance of basic aircraft electrical systems and components involving inspection, limited testing and troubleshooting, and component removal and installation during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

Applications include fixed wing aircraft with fixed undercarriage and basic rotary wing aircraft with skids or floats and no powered flight controls powered by either a normally aspirated piston engine or small gas turbine.

The unit is part of the small aircraft maintenance Certificate III and IV Mechatronics training pathways.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|--|-----|---|
| 1. | Inspect basic aircraft electrical systems and components | 1.1 | Relevant maintenance documentation and modification status, including system defect reports where relevant, are used to identify specific inspection requirements |
| | | 1.2 | Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | | 1.3 | Direct current (DC) electrical system is visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | | 1.4 | Defects are correctly identified and reported |
| 2. | Test/adjust basic aircraft electrical systems | 2.1 | Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | | 2.2 | Electrical system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | | 2.3 | System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. | Troubleshoot basic aircraft electrical systems | 3.1 | Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | | 3.2 | Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | | 3.3 | Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | | 3.4 | System faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, and in accordance with standard enterprise procedures |

- 3.5 Rectification requirements are determined
4. Remove and install basic aircraft electrical system components
- 4.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
- 4.2 Electrical component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements
- 4.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
- 4.4 Removed components are tagged and packaged in accordance with specified procedures
- 4.5 Electrical components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
- 4.6 Physical installation of electrical components is performed in accordance with the applicable maintenance manual, ensuring appropriate adjustment/alignment with mechanical interface is carried out
- 4.7 System is reinstated to correct operational condition in preparation for testing, as necessary
- 4.8 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional

contexts) are included.

Applicable electrical systems include:

- DC power generation, regulation and distribution systems
- Piston engine and gas turbine engine ignition and starting systems (where applicable to the enterprise)
- DC electrical systems, such as flaps, including related motors and actuators
- Aircraft lighting
- Aircraft main battery

Applicable electrical components include:

- DC generators, and alternator/rectifier generators, and components of related single generator regulation and distribution systems
- Motors
- Actuators
- Piston engine and gas turbine engine ignition and starting system components
- Aircraft batteries
- Aircraft lighting components, such as bulbs, lenses, switches and rheostats

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA274A Maintain basic light aircraft electrical systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA274 Maintain basic light aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including those relating to gas turbine engine high energy ignition units
- using approved maintenance documentation and aircraft publications relating to DC electrical systems
- identifying/locating:
 - DC power generation, regulation, distribution and control systems and components:
 - generators and starter/generators
 - regulators
 - bus bars
 - circuit breakers and fuses
 - wiring
 - piston engine ignition and starting systems and components
 - magnetos or coils
 - starter motors
 - ignition switches/start switches
 - ignition harnesses
 - low tension wiring
 - spark plugs
 - auxiliary starting devices
 - gas turbine engine ignition and starting systems (where applicable to the enterprise):
 - starter motors and starter/generators
 - high energy ignition units
 - control units
 - switches
 - batteries and associated mounting equipment, including related anti-vibration aids
 - motors and actuators in basic DC electrical systems
- correctly connecting DC generators, alternator/rectifier generators and starter/generators

- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in:
 - DC power generation systems including regulation, distribution and control
 - battery installations
 - piston engine ignition and starting systems
 - gas turbine engine ignition and starting systems (where applicable to the enterprise)
 - internal/external lighting systems, including controls
 - motors and actuators in basic DC electrical systems
- applying logic processes, taking and interpreting electrical measurements, using test equipment and appropriate wiring diagrams and manuals to isolate malfunctions in the above systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting and component removal and installation is essential. This is to be demonstrated through application across a range of aircraft electrical systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- DC electrical principles:
 - properties of permanent magnets
 - precautions for the care and storage of permanent magnets
 - properties of electromagnets
 - primary and secondary cells
 - aircraft battery types, construction, care and safety
 - resistor characteristics
 - fuses and circuit breakers
 - fundamental DC circuits
 - inductive circuits
 - capacitive circuits

- basic fault-finding principles
- general construction, operating characteristics and applications for aircraft:
 - DC generators
 - alternator/rectifier generators
 - DC motors including starter motors
 - starter/generators
 - DC actuators (linear and rotary)
 - gas turbine high energy ignition system components and related safety precautions
 - lighting systems
- the basic layout (block diagram level), function and operation of the systems listed in the Range of Conditions
- electrical system maintenance requirements and troubleshooting procedures
- relevant WHS practices, including those relating to gas turbine engine high energy ignition units
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on electrical looms, cables and connection hardware, and on each of the following systems and on at least one (1) major component/line replaceable unit (LRU) in each case:
 - DC power generation, regulation and distribution systems
 - piston engine and gas turbine engine ignition and starting systems (gas turbine may be omitted where not applicable to the enterprise)
 - DC electrical systems, such as flaps, including related motors and actuators
 - aircraft lighting
 - aircraft main battery (competency may be demonstrated through the performance of a battery check).
- Component removal and installation competencies are to be demonstrated on at least one (1) component from each of:

- DC generators, and alternator/rectifier generators, and components of related single generator regulation and distribution systems
- motors
- actuators
- piston engine and gas turbine engine ignition and starting system components (gas turbine may be omitted where not applicable to the enterprise)
- aircraft batteries
- aircraft lighting components such as bulbs, lenses, switches and rheostats .
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA275 Maintain basic light aircraft instrument systems and components

Modification History

Release 2 - Electronic flight instrument systems added to Range of Conditions

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable test equipment to inspect, test and troubleshoot basic aircraft instrument systems and to remove and install components during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

Applications include light fixed wing aircraft with fixed undercarriage and basic rotary wing aircraft with skids or floats and no powered flight controls powered by either a normally aspirated piston engine or small gas turbine.

The unit is part of the small aircraft maintenance Certificate III and IV Mechatronics training pathways.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Inspect basic aircraft instrument systems and components

- 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements
- 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements
- 1.3 Instrument system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual
- 1.4 Defects are correctly identified and reported

2. Test/adjust basic aircraft instrument systems and components

- 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
- 2.2 Instrument system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction
- 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate

3. Troubleshoot basic aircraft instrument systems and components

- 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination
- 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level
- 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
- 3.4 Instrument system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in

- accordance with standard enterprise procedures
- 3.5 Rectification requirements are determined
4. Remove and install basic aircraft instrument system components
- 4.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted where necessary to ensure personnel safety
- 4.2 Instrument component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements
- 4.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
- 4.4 Removed components are tagged and packaged in accordance with specified procedures
- 4.5 Instrument components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
- 4.6 Physical installation of instrument components is performed in accordance with the applicable maintenance manual and regulatory requirements, ensuring appropriate adjustment/alignment is carried out
- 4.7 System is reinstated to correct operational condition in preparation for testing, as necessary
- 4.8 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional

contexts) are included.

Applicable instrument systems and components include:

- Pitot/static systems and components, airspeed indicators (ASI), vertical speed indicators (VSI), outside air temperature gauges (OAT) and counter-pointer altimeters
- Directional gyros (DGs) and artificial horizons (AHs) (air and electrically driven)
- Turn and bank and slip/turn coordinators
- Direct reading compasses
- Piston engine and gas turbine engine indication system components (direct reading measuring instruments and temperature indication)
- Electrical systems indication (voltage and current)
- Basic fuel quantity indication systems and components
- Vacuum indication components
- Electronic flight and engine instruments (where applicable to the enterprise)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 2 - electronic flight instrument systems added to Range of Conditions and Assessment Requirements. No change in outcome

Release 1 – equivalent to MEA275A Maintain basic light aircraft instrument systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA275 Maintain basic light aircraft instrument systems and components

Modification History

Release 2 - Electronic flight instrument systems added to Assessment Requirements

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using approved maintenance documentation and aircraft publications relating to basic instrument systems
- locating and identifying flight instrument system components comprising:
 - engine system temperature and speed, including mechanical and electrical tachometers
 - auxiliary direct reading systems, including vacuum, fuel storage quantities
 - flight systems, including attitude, altitude, air speed and OAT
- locating and identifying direct reading compasses
- correct handling and observance of maintenance precautions relating to gyroscopes, gimbals and pitot/static systems (connections, heating and protrusions)
- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware, including cabling/harnesses, and security in:
 - flight instruments
 - pitot/static systems
 - direct reading compasses
 - piston engine and gas turbine engine indication systems
 - electrical systems indication
 - basic fuel quantity indication systems
 - vacuum indication systems
- applying logic processes, taking and interpreting system measurements, using test equipment and appropriate wiring diagrams and manuals to isolate malfunctions in the above systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- applying WHS requirements relevant to instrument system maintenance.

Where relevant to the enterprise:

- locating and identifying:
 - electronic flight instrument system (EFIS)

- engine indicating and crew alerting system (EICAS)
- electronic central aircraft monitoring (ECAM)
- data linkage and transmission systems
- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses)
- interpreting the information presented on instrument display systems
- performing system functional tests and checks to confirm post-maintenance serviceability

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the instrument system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of basic aircraft instrument systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- handling precautions for electrostatic sensitive devices
- relevant WHS practices
- the basic layout (block diagram level), function and operation of the following systems as listed in the Range of Conditions:
 - pitot/static systems
 - piston engine and gas turbine engine direct reading indication systems
 - basic fuel quantity measurement systems
- the operating principles of the above systems and associated with:
 - atmospheric conditions; properties and effects on aircraft instruments and systems
 - pressure and temperature sensing elements and their use in aircraft instruments
 - gyroscopes and their use in aircraft instrument systems
 - electrical fundamentals
- instrument construction and operation:
 - instrument groupings, panel layout and construction
 - pitot static instruments (ASI, VSI and counter-pointer altimeters), their operation, calibration, safe handling and related terminology
 - pitot pressure
 - static pressure
 - altimeter Q code settings:

- QNH
- QNE
- QFE
- indicated airspeed (IAS)
- true airspeed (TAS)
- vacuum system indication component construction and operation
- air and electrically powered artificial horizon construction and operation
- DG construction and operation
- construction and operation of direct reading engine instruments
- turn and bank and slip/turn coordinator construction and operation
- direct reading compass construction and compass calibration
- piston and gas turbine engine direct reading measuring instruments and temperature indication instruments construction and operation
- voltage and current measuring instrument construction and operation
- volumetric fluid quantity system components, construction and operation
- instrument system maintenance requirements and troubleshooting procedures, including pitot/static system leak testing
- relevant maintenance documentation and maintenance publications
- relevant regulatory requirements and standard procedures
- for electronic flight and engine instrument systems:
 - the layout and operation (to block diagram level) of EFIS, EICAS and ECAM systems and related data linkage and transmission systems
 - interpretation of display data
 - component removal and installation procedures
 - testing of system operation using on-board testing procedures and/or simple external test equipment with a go or no go outcome
 - software management control requirements.
-

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one major system component/line replaceable unit (LRU) from each of the following groups:
 - pitot/static systems and components, ASI, VSI and counter-pointer altimeters
 - DGs and AHs (air and electrically driven)
 - turn and bank and slip/turn coordinators
 - direct reading compasses
 - piston engine and gas turbine engine indication system components (direct reading measuring instruments and temperature indication)
 - electronic flight and engine instrument system components (may be omitted if not relevant to the enterprise)
 - electrical systems indication (voltage and current)
 - basic fuel quantity indication systems and components
 - vacuum indication components.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA276 Maintain basic aircraft communication and radio navigation systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, functionally test and troubleshoot basic communication and radio navigation systems and to remove and install components during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

Applications include communication and radio navigation systems of fixed wing aircraft with fixed undercarriage and basic rotary wing aircraft with skids or floats and no powered flight controls powered by either a normally aspirated piston engine or small gas turbine.

The unit is part of the small aircraft maintenance Certificate III and IV Mechatronics training pathways.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect basic communication and radio navigation systems and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.3 Communication and radio navigation systems and components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual |
| | 1.4 Defects are correctly identified and reported |
| 2. Functionally test basic communication and radio navigation systems and components | 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Communication and radio navigation systems are functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 Deficiencies are correctly identified and reported |
| 3. Troubleshoot basic communication and radio navigation systems | 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 Communication and radio navigation system faults are located and are correctly recorded in maintenance documentation in accordance with standard operating |

- procedures
4. Remove and install basic radio communication and navigation system components
- 4.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
 - 4.2 Communication and navigation system component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements
 - 4.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 4.4 Removed components are tagged and packaged in accordance with specified procedures
 - 4.5 Communication and navigation system components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
 - 4.6 Physical installation of components is performed in accordance with the applicable maintenance manual and regulatory requirements, ensuring appropriate adjustment/alignment is carried out
 - 4.7 System is reinstated to correct operational condition in preparation for testing, as necessary
 - 4.8 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Applicable communication and radio navigation systems and components include:

- High frequency (HF) and very high frequency (VHF) communication line replaceable units (LRUs), transmission lines and antennas
- Automatic direction finding (ADF), very high frequency omni-directional range (VOR) and global navigation system (GNS) navigation system LRUs, transmission lines and antennas
- Air traffic control (ATC) transponders, transmission lines and antennas
- Automatic dependent surveillance-broadcast (ADS-B)
- Emergency location transmitter (ELT)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA276 Maintain basic aircraft communication and radio navigation systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the radio frequency and communications system being maintained
- locating and identifying radio communication and navigation system components comprising:
 - HF and VHF communications
 - VOR, ADF and GNS
 - ATC transponders
 - ADS-B
 - ELT systems
- locating and identifying applicable radio system antennas
- recognition of system and component defects/external damage, correct installation, attaching hardware (including cabling/harnesses/transmission lines) and security in:
 - HF and VHF communications systems
 - VOR, ADF and GNS
 - ATC transponders
 - ADS-B
 - ELT systems
- applying logic processes, functional testing and visual inspections to isolate malfunctions within the above systems
- functionally testing listed systems to assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the basic communication or radio navigation system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, functional testing and visual troubleshooting is essential. This is to be demonstrated through application across a range of basic aircraft communication and radio navigation systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- printed circuit boards
- semiconductors
- fibre optics
- handling precautions for electrostatic sensitive devices
- relevant WHS practices
- the use of approved maintenance documentation and aircraft publications relating to radio communication and navigation systems and components
- the general working principles of communication and navigation systems
- explaining the basic system layout (block diagram level), function and operation of:
 - HF and VHF communications systems
 - VOR, ADF and GNS navigation systems
 - ATC transponders
 - ELT systems
 - ADS-B systems
- radio frequency and communication system maintenance requirements and basic troubleshooting procedures
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one (1) major system component/LRU from each of the following groups:
 - HF and VHF communication LRUs, transmission lines and antennas
 - ADF, VOR and GNS navigation system LRUs, transmission lines and antennas
 - ATC transponders, transmission lines and antennas
 - ELT
 - ADS-B.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA277 Maintain twin engine aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency extends the competencies developed in units MEA202 Remove and install basic aircraft electrical system components and MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components to include the maintenance of additional electrical systems found in twin piston engine fixed wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the small aircraft maintenance Certificate IV Mechatronics training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA210 Inspect, test and troubleshoot basic aircraft electrical systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Inspect twin engine aircraft electrical systems and components
 - 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements
 - 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements
 - 1.3 Direct current (DC) electrical system is visually or physically checked for external signs of defects in accordance with applicable maintenance manual
 - 1.4 Defects are correctly identified and reported
2. Test/adjust twin engine aircraft electrical systems
 - 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
 - 2.2 Electrical system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction
 - 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate
3. Troubleshoot twin engine aircraft electrical systems
 - 3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination
 - 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level
 - 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
 - 3.4 System faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, and in accordance with standard enterprise procedures
 - 3.5 Rectification requirements are determined
4. Remove and install twin engine aircraft electrical system components
 - 4.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety

- 4.2 Electrical component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements
- 4.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
- 4.4 Removed components are tagged and packaged in accordance with specified procedures
- 4.5 Electrical components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
- 4.6 Physical installation of electrical components is performed in accordance with the applicable maintenance manual, ensuring appropriate adjustment/alignment with mechanical interface is carried out
- 4.7 System is reinstated to correct operational condition in preparation for testing, as necessary
- 4.8 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

DC electrical systems include:

- DC multi-generator and alternator/rectifier generator regulation and distribution systems and components
- Electrical propeller control systems, such as feathering systems (where applicable to the enterprise)
- Batteries in dual battery installations and associated

- mounting equipment, including related anti-vibration aids
- Fire warning and extinguishing systems, including handling of halogen fire extinguishers (where applicable to the enterprise)
 - Combustion heating systems (where applicable to the enterprise)
 - Equipment cooling and ventilation
 - Fuel storage and distribution systems
 - Master and central warning systems (where applicable to the enterprise)
- Electrical components include:**
- Components of multi-generator regulation and distribution systems
 - Electrical propeller control system components (where applicable to the enterprise)
 - Batteries in dual battery installations and associated mounting equipment, including related anti-vibration aids
 - Fire warning and extinguishing system components (where applicable to the enterprise)
 - Combustion heaters and associated components (where applicable to the enterprise)
 - Equipment cooling and ventilation components
 - Fuel storage and distribution system electrical components
 - Master and central warning system components (where applicable to the enterprise)
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA277A Maintain twin engine aircraft electrical systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA277 Maintain twin engine aircraft electrical systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to twin engine aircraft electrical systems
- identifying/locating:
 - DC multi-generator power generation, regulation, distribution and control systems and components, i.e. regulators and bus bars
 - electrical propeller control systems and components, such as feathering and synchronising systems
 - batteries in dual battery installations and associated mounting equipment, including related anti-vibration aids
 - fire warning and extinguishing systems and components
 - identification of halogen (e.g. BCF) fire extinguishers
 - combustion heating systems
 - equipment cooling and ventilation
 - fuel storage and distribution system electrical components
 - master and central warning systems
- correctly connecting DC generators and alternator/rectifier generators in multi-generator systems and paralleling generator output
- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in the above systems and system components
- applying logic processes, taking and interpreting electrical measurements, using test equipment and appropriate wiring diagrams and manuals to isolate malfunctions in the above systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the electrical system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting and component removal and installation is essential. This is to be demonstrated through application across a range of aircraft electrical systems and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- system testing procedures and paralleling of generator output
- the basic layout (block diagram level), function and operation of:
 - DC multi-generator and alternator/rectifier generator regulation and distribution systems and components
 - electrical propeller control systems, such as feathering and synchronising systems and system components
 - dual battery systems and associated mounting equipment, including related anti-vibration aids
 - fire warning and extinguishing systems and system components, including regulatory requirements relating to halogen (e.g. BCF) fire extinguishers
 - combustion heating systems and system components
 - equipment cooling and ventilation systems and system components
 - fuel storage and distribution systems and system components
 - master and central warning systems and system components
- maintenance requirements and troubleshooting procedures for the above electrical systems
- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.

- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on electrical looms, cables and connection hardware, and on each following system and on at least one (1) major component/line replaceable unit (LRU) in each case:
 - DC multi-generator and alternator/rectifier generator regulation and distribution systems and components
 - electrical propeller control systems, such as feathering systems (where applicable to the enterprise)
 - batteries in dual battery installations and associated mounting equipment, including related anti-vibration aids (competency may be demonstrated through the performance of a battery check)
 - fire warning and extinguishing systems, including handling of halogen fire extinguishers (where applicable to the enterprise)
 - combustion heating systems (where applicable to the enterprise)
 - equipment cooling and ventilation
 - fuel storage and distribution systems
 - master and central warning systems (where applicable to the enterprise).
- Component removal and installation competencies are to be demonstrated on at least one (1) component from each of the following groups:
 - components of multi-generator regulation and distribution systems
 - electrical propeller control system components (where applicable to the enterprise)
 - batteries in dual battery installations and associated mounting equipment, including related anti-vibration aids
 - fire warning and extinguishing system components (where applicable to the enterprise)
 - combustion heaters and associated components (where applicable to the enterprise)
 - equipment cooling and ventilation components
 - fuel storage and distribution system electrical components
 - master and central warning system components (where applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA278 Inspect, test and troubleshoot instrument display systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot electronic instrument display systems and components of fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the small aircraft maintenance Certificate IV Mechatronics and the Avionic Certificate IV (Aircraft Maintenance Stream) training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207 Remove and install aircraft electronic system components

MEA246 Fabricate and/or repair aircraft electrical hardware or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills, tools and test equipment in the testing, adjustment and troubleshooting of instrument display systems and data transmission and linkage systems
- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) for the range of systems listed in the Range of Conditions
- interpreting the information presented on instrument display systems
- applying logic processes and using appropriate wiring diagrams and manuals to isolate instrument display system malfunctions
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process
- applying standard procedures
- observing all relevant WHS procedures.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the instrument display system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This may be demonstrated through application across a range of aircraft instrument and display systems (where display systems are applicable to the enterprise) listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool and test equipment usage and installation/securing of system components

- the basic layout (block diagram level) of the systems listed in the Range of Conditions
- the operating principles of the systems listed in the Range of Conditions and associated with:
 - electrical and instrument fundamentals relating to multi-function display systems
 - interpretation of display information and display screen symbol generation
 - the operation of each listed system and system components
- WHS procedures relating to instrument display systems and components
- relevant Aeronautical Radio Incorporated (ARINC) specifications (avionic data bus)
- relevant maintenance manuals
- maintenance requirements and troubleshooting procedures
- relevant regulatory requirements and standard procedures, including software management control.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on a system and on at least one (1) major system component of each of the following:
 - EFIS
 - EICAS
 - ECAM
 - Data linkage and transmission systems
 - HUD (may be omitted if not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA279 Inspect, test and troubleshoot full authority digital engine control systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications and test sets in the inspection, testing and troubleshooting of full authority digital engine control (FADEC) systems of fixed and rotary wing aircraft scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) and small aircraft maintenance Certificate IV (Mechatronic) training pathways.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

- | | |
|--------|---|
| MEA207 | Remove and install aircraft electronic system components |
| MEA246 | Fabricate and/or repair aircraft electrical hardware or parts |

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
---	---

1. Inspect FADEC systems and components
 - 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements
 - 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual
 - 1.3 FADEC system is visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements
 - 1.4 Defects are correctly identified and reported
2. Test FADEC systems
 - 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
 - 2.2 FADEC system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction
3. Troubleshoot FADEC systems
 - 3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination
 - 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting using test sets, downloaded maintenance data and fault-finding charts or similar, to line replacement level
 - 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
 - 3.4 System faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, and in accordance with standard enterprise procedures
 - 3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- FADEC systems include:**
- Computers, sensors, interfaces, cockpit controls, data cables and wiring looms that comprise the electronic control system
 - Other engine-mounted related components, such as spark plugs, ignition units, injectors and fuel control units are covered by the applicable engine maintenance units (e.g. MEA313 Inspect, test and troubleshoot piston engine systems and components, MEA314 Inspect, test and troubleshoot gas turbine engine systems and components or MEA353 Maintain basic light aircraft engines and propellers)
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA279 Inspect, test and troubleshoot full authority digital engine control systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including those relating to engine ground running
- using approved maintenance documentation and aircraft publications relating to the applicable FADEC system
- using test sets to download maintenance data from the FADEC system and interpreting the data
- identifying/locating airframe and engine, including propeller/rotor-mounted FADEC system components
- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in airframe and engine-mounted FADEC system components
- correctly handling electrostatic sensitive devices
- applying logic processes, using test equipment and appropriate wiring diagrams and manuals to isolate FADEC system malfunctions
- using built-in test features to confirm post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the FADEC system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting and component removal and installation is essential. This is to be demonstrated through application on FADEC systems and components as defined in the Range of Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs

- digital electronic theory
- open and closed loop control
- the basic layout (block diagram level), function and operation of FADEC systems
- architecture of FADEC system computers, software and software management
- operation of sensors that input data to FADEC system computers
- built-in test system operation and downloading and interpretation of system data
- relevant regulatory requirements and standard procedures, including software management control
- maintenance requirements and troubleshooting procedures
- relevant maintenance manuals.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on FADEC systems and system components as follows:
 - computers, sensors, interfaces, cockpit controls, data cables and wiring looms that comprise the electronic control system
- Other engine-mounted related components, such as spark plugs, ignition units, injectors and fuel control units are covered by the applicable engine maintenance units (e.g. MEA313 Inspect, test and troubleshoot piston engine systems and components, MEA314 Inspect, test and troubleshoot gas turbine engine systems and components or MEA353 Maintain basic light aircraft engines and propellers) and should not be assessed as part of this unit.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA280 Inspect, test and troubleshoot flight management systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot flight management system computers, control display units, database units and the interface with flight control and navigation systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

Applications include fixed and rotary wing aircraft that have flight management systems.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207	Remove and install aircraft electronic system components
MEA246	Fabricate and/or repair aircraft electrical hardware or parts

Competency Field

Assessment Requirements for MEA280 Inspect, test and troubleshoot flight management systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills, tools and test equipment in the testing and troubleshooting of flight management systems
- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) for the system components listed in the Range of Conditions
- interpreting the information presented on control display units
- applying logic processes and using appropriate wiring diagrams and manuals to isolate flight management system malfunctions
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process
- applying standard procedures
- observing all relevant WHS procedures.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the flight management system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

This may be demonstrated through application across the components of a flight management system as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool and test equipment usage and installation/securing of system components
- electrical principles and digital electronic theory

- the basic layout (block diagram level) of flight management systems
- the operating principles of flight management computers, control display units and database units, including the interface with flight control, engine control and navigation systems
- the interface with Aircraft Communication Addressing and Reporting System and relevant Aeronautical Radio Incorporated (ARINC) specifications (avionic data bus)
- the operation of integral GPS sensors
- WHS procedures relating to flight management systems and components
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures, including software management control
- maintenance requirements and troubleshooting procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards, including software management control.
- Where the flight management system includes integral GPS, consideration may be given to concurrent assessment of MEA234 Inspect, test and troubleshoot aircraft global navigation systems and components.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on a system and on at least one (1) major system component of each of:
 - flight management computer
 - control display unit
 - database unit
 - GPS sensor (may be omitted if not applicable to enterprise)
 - GPS antenna (may be omitted if not applicable to enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA281 Maintain light aircraft AC powered instrument systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable test equipment to inspect, test and troubleshoot alternating current (AC) powered aircraft instrument systems, including the power supply, and to remove and install components during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

Applications include light fixed wing and rotary wing aircraft with piston or turbine engines.

The unit is part of the small aircraft maintenance Certificate IV (Mechatronics) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.	demonstrate achievement of the element.
1. Inspect light aircraft AC instrument systems, power supplies and components	<p>1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements</p> <p>1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual</p> <p>1.3 AC instrument system and AC power supply components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements</p> <p>1.4 Defects are correctly identified and reported</p>
2. Test/adjust light aircraft AC instrument systems, power supplies and components	<p>2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation</p> <p>2.2 Instrument system and AC power supply is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction</p> <p>2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate</p>
3. Troubleshoot light aircraft AC instrument systems, power supplies and components	<p>3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination</p> <p>3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting, using test sets, downloaded maintenance data and fault-finding charts or similar, to line replacement level</p> <p>3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process</p> <p>3.4 Instrument system or power supply faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise</p>

- procedures
- 3.5 Rectification requirements are determined
4. Remove and install light aircraft AC instrument system, and power supply components
- 4.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
- 4.2 Instrument or power supply component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements
- 4.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
- 4.4 Removed components are tagged and packaged in accordance with specified procedures
- 4.5 Instrument or power supply components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
- 4.6 Physical installation of instrument or power supply components is performed in accordance with the applicable maintenance manual and regulatory requirements, ensuring appropriate adjustment/alignment is carried out
- 4.7 System is reinstated to correct operational condition in preparation for testing, as necessary
- 4.8 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect

performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

AC instrument systems and AC power supply components include:

- Directional gyro (DG), artificial horizon (AH), attitude heading and reference system (AHRS) and components, servo and encoding altimeters, and remote reading gyro compasses and components
- Piston engine and gas turbine engine indication system components
- Fuel quantity indication and flow indication systems and components
- Transmitter/indicator measuring instrument systems (pressure, temperature and vacuum) and components
- Inverters and transformer/rectifier units
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA281 Maintain light aircraft AC powered instrument systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- using approved maintenance documentation and aircraft publications relating to AC instrument systems and related AC power supplies
- locating and identifying AC powered instrument system components including:
 - AH, DG, AHRS, servo and encoding altimeters
 - engine system temperature, speed, oil pressure, torque and manifold pressure
 - auxiliary systems, including vacuum, fuel storage quantities and fuel flow
 - remote reading gyro compasses
- locating and identifying AC instrument power supply system components, including:
 - inverters
 - transformer/rectifier units
 - voltage and frequency indication
- correctly handling and observing maintenance precautions for gyroscopes and gimbals
- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in AC powered instruments and related power supply, including:
 - flight instruments
 - remote reading gyro compasses
 - piston engine and gas turbine engine indication systems (indicators and transmitters/sensors)
 - fuel quantity and flow indication systems (indicators, probes and transmitters)
 - transmitter/indicator measuring instrument systems (pressure, temperature and vacuum)
 - AC power supply, including inverters and transformer/rectifier units
- applying logic processes, taking and interpreting system measurements, using test equipment and appropriate wiring diagrams and manuals to isolate malfunctions in the above systems
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- applying WHS requirements relevant to instrument and electrical system maintenance.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across a range of AC powered aircraft instrument systems, AC power supplies and components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware and plugs
- handling precautions for electrostatic sensitive devices
- relevant WHS practices
- AC theory:
 - calculations and measurement in AC circuits
 - inductors and inductive reactance
 - transformer operation
 - capacitors and capacitive reactance
 - LCR circuits and resonance
 - passive filters
 - power relationship in reactive circuits
- the basic layout (block diagram level), function and operation of AC powered:
 - flight instruments
 - remote reading gyro compasses
 - piston engine and gas turbine engine indication systems (indicators and transmitters/sensors)
 - fuel quantity and flow indication systems (indicators, probes and transmitters)
 - transmitter/indicator measuring instrument systems (pressure, temperature and vacuum)
 - AC power supply including AC generators, inverters and transformer/rectifier units
- the operating principles of the above systems and associated with:
 - atmospheric conditions – properties and effects on aircraft instruments and systems
 - pressure and temperature sensing elements and their use in aircraft instrument systems
 - gyroscopes and their use in aircraft instrument systems
 - electrical fundamentals
- relevant maintenance documentation and maintenance publications

- maintenance requirements and troubleshooting procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one (1) major system component/line replaceable unit (LRU) from each of the following groups:
 - DG, AH, AHRS and components, servo and encoding altimeters, remote reading gyro compasses and components
 - piston engine and gas turbine engine indication system components
 - fuel quantity indication and flow indication systems and components
 - transmitter/indicator measuring instrument systems (pressure, temperature, vacuum) and components
 - inverters and transformer/rectifier units.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA282 Repair or overhaul aircraft pulse system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, test equipment and knowledge of pulse, analogue and digital theory to repair or overhaul components from fixed and rotary wing aircraft pulse systems that are repaired or overhauled in aviation maintenance workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Component Workshop Maintenance Stream) training pathway.

Repair of circuit boards is covered by MEA262 Modify/repair single layer printed circuit boards and MEA263 Modify/repair multi-layer printed circuit boards.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA260 Use electrical test equipment

MEA261 Use electronic test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Determine requirements
 - 1.1 Pulse system component defect reports (removal tags) or customer order are correctly interpreted and matched by part and serial numbers
 - 1.2 Circuitry is correctly prepared and connected to the applicable test equipment and is functionally tested or cycled through the prescribed test procedures in accordance with the maintenance documentation for evidence of serviceability or malfunction
 - 1.3 Modification status is clearly established to assist in determining the overhaul requirements for the components
 - 1.4 Extent of overhaul or repair is correctly identified and documented
2. Troubleshoot pulse system components
 - 2.1 Available information from maintenance records and inspection and test results is used, where necessary, to assist in fault determination
 - 2.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting
 - 2.3 Faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required
 - 2.4 Fault rectification requirements are determined
3. Dismantle and inspect pulse system components
 - 3.1 Component parts are dismantled in accordance with maintenance manuals while observing all relevant work health and safety (WHS) requirements
 - 3.2 Component parts are assessed for serviceability in accordance with the relevant maintenance documentation
 - 3.3 Parts requiring specialist repair are tagged and repair instructions are accurately specified
 - 3.4 Parts lists are compiled and processed in accordance with standard enterprise procedures
4. Repair and/or modify pulse system components
 - 4.1 Component parts are repaired or replaced in accordance with the relevant maintenance documentation

- | | | | | | | | | |
|-----|---|--|-----|---|-----|---|-----|---|
| | 4.2 | Modification of components or parts is undertaken, where required, by relevant manufacturers' bulletins or procedures | | | | | | |
| 5. | Assemble, test and adjust pulse system components | <table border="0"> <tr> <td>5.1</td> <td>Assembly of component parts is carried out in accordance with specified tolerances and the applicable maintenance documents</td> </tr> <tr> <td>5.2</td> <td>Assembled components are tested and adjusted/aligned in accordance with the applicable maintenance documentation using the appropriate test equipment</td> </tr> <tr> <td>5.3</td> <td>Required maintenance documentation and modification records are completed and processed in accordance with standard enterprise procedures</td> </tr> </table> | 5.1 | Assembly of component parts is carried out in accordance with specified tolerances and the applicable maintenance documents | 5.2 | Assembled components are tested and adjusted/aligned in accordance with the applicable maintenance documentation using the appropriate test equipment | 5.3 | Required maintenance documentation and modification records are completed and processed in accordance with standard enterprise procedures |
| 5.1 | Assembly of component parts is carried out in accordance with specified tolerances and the applicable maintenance documents | | | | | | | |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Pulse system components include:

- Weather radar, search radar and weapons system radar
- Distance measuring equipment (DME) and tactical aerial navigation (TACAN)
- Doppler navigation
- Air traffic transponder
- Radio altimeter
- Airborne collision avoidance system (ACAS)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA282A Repair or overhaul aircraft pulse system components

Assessment Requirements for MEA282 Repair or overhaul aircraft pulse system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved repair/overhaul manuals, procedures and processes relating to pulse system components
- recognising the serviceability state and repair or overhaul requirements for pulse system components
- applying logic processes, using test equipment and appropriate wiring diagrams and manuals to isolate component faults
- performing component testing to isolate/confirm component fault and assess post-repair/overhaul serviceability
- correctly aligning components listed above to operate within prescribed specifications.

It is essential that system testing and aligning procedures, cleanliness requirements and safety precautions applicable to the pulse system components being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing, alignment and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to testing, aligning and troubleshooting is essential. This may be demonstrated through application across a representative range of the components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component and system operation
- the basic function and operation of components of pulse systems to enable testing for fault isolation/confirmation, to determine repair or overhaul requirements and serviceability status post-repair or overhaul
- basic principles/functions relating to pulse system components and associated with:

- advanced analogue fundamentals
- digital fundamentals
- AC and DC electrical systems
- electromagnetic radiation
- antenna and transmission line (including waveguide) characteristics
- pulsed radar system operation.

Assessment Conditions

- Competency should be assessed in the work environment, using tools and equipment specified in maintenance documentation. It is also expected that general and special-purpose tools and test equipment would be used where appropriate.
- The application of testing procedures should also clearly indicate knowledge of system operation before undertaking any action. Knowledge of system operation and the relationship of individual components will be necessary to supplement evidence of ability to troubleshoot component faults. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards. Use of high precision, high reliability soldering techniques and handling of components, including application of anti-static equipment, must be demonstrated.
- Assessment should be made across a sufficient number of components to establish the ability to apply attained skills and knowledge across the full range of pulse system components with the aid of applicable maintenance manuals and data.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of components from two (2) or more of the following groups:
 - weather radar, search radar and weapons system radar
 - DME and TACAN
 - doppler navigation
 - air traffic transponder
 - radio altimeter
 - ACAS.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA283 Repair or overhaul aircraft display, control and distribution system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, test equipment and knowledge of pulse, analogue and digital theory to repair or overhaul pulse system components from aircraft control and distribution systems during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

Applications include control and distribution system components from fixed and rotary wing aircraft that are repaired or overhauled in aviation maintenance workshops.

The unit is part of the Avionic Certificate IV (Component Workshop Maintenance Stream) training pathway.

Repair of circuit boards is covered by MEA262 Modify/repair aircraft component single layer printed circuit boards and MEA263 Modify/repair aircraft component multi-layer printed circuit boards.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA260 Use electrical test equipment

MEA261 Use electronic test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Determine requirements | 1.1 Display, control and distribution system component defect reports (removal tags) or customer order are correctly interpreted and matched by part and serial numbers |
| | 1.2 Circuitry is correctly prepared and connected to the applicable test equipment and is functionally tested or cycled through the prescribed test procedures in accordance with the maintenance documentation for evidence of serviceability or malfunction |
| | 1.3 Modification status is clearly established to assist in determining the overhaul requirements for the components |
| | 1.4 Extent of overhaul or repair is correctly identified and documented |
| 2. Troubleshoot display, control and distribution system components | 2.1 Available information from maintenance records and inspection and test results is used, where necessary, to assist in fault determination |
| | 2.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting |
| | 2.3 Faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required |
| | 2.4 Fault rectification requirements are determined |
| 3. Dismantle and inspect display, control and distribution system components | 3.1 Component parts are dismantled in accordance with maintenance manuals while observing all relevant work health and safety (WHS) requirements |
| | 3.2 Component parts are assessed for serviceability in accordance with the relevant maintenance documentation |
| | 3.3 Parts requiring specialist repair are tagged and repair instructions are accurately specified |

- | | | | |
|----|---|-----|---|
| | | 3.4 | Parts lists are compiled and processed in accordance with standard enterprise procedures |
| 4. | Repair and/or modify display, control and distribution system components | 4.1 | Component parts are repaired or replaced in accordance with the relevant maintenance documentation |
| | | 4.2 | Modification of components or parts is undertaken, where required, by relevant manufacturers' bulletins or procedures |
| 5. | Assemble, test and adjust display, control and distribution system components | 5.1 | Assembly of component parts is carried out in accordance with specified tolerances and the applicable maintenance documents |
| | | 5.2 | Assembled components are tested and adjusted/aligned in accordance with the applicable maintenance documentation using the appropriate test equipment |
| | | 5.3 | Required maintenance documentation and modification records are completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Display, control and distribution system components

- Display, control and distribution system components are from any or all of the following aircraft systems:
 - display systems, including electronic flight instrument systems (EFIS), engine indicating and crew alerting system (EICAS) and electronic central aircraft monitoring (ECAM)
 - automatic flight control system (AFCS)
 - autopilots (digital and analogue)
 - flight director (digital and analogue)
 - flight management

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA283 Repair or overhaul aircraft display, control and distribution system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved repair/overhaul manuals, procedures and processes relating to aircraft display, control and distribution system components
- recognising the serviceability state and repair or overhaul requirements for components from:
 - digital electronic instruments/display systems
 - digital flight controllers and directors
 - digital AFCS/autopilot systems
 - flight management systems
 - analogue components of control and distribution systems
- applying logic processes, using test equipment and appropriate wiring diagrams and manuals to isolate component faults
- performing component testing to isolate/confirm component fault and assess post-repair/overhaul serviceability
- correctly aligning components listed above to operate within prescribed specifications
- correctly interpreting digital instrument display indications, information and symbols.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the display, control and distribution system components being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing, alignment and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to testing, aligning and troubleshooting is essential. This may be demonstrated through application across a representative range of the components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component and system operation
- the basic function and operation of components as follows to enable testing for fault isolation/confirmation, to determine repair or overhaul requirements, and serviceability status post-repair or overhaul:
 - digital electronic instruments/display system components
 - digital flight controllers and directors
 - digital AFCS/autopilot system components
 - flight management system components
 - analogue components of control and distribution systems
- basic principles/functions, relating to the above systems/components and associated with:
 - advanced analogue fundamentals, including video display generation techniques
 - digital fundamentals
- alternating current (AC) and direct current (DC) electrical systems.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that general and special-purpose tools and test equipment would be used where appropriate.
- The application of testing procedures should also clearly indicate knowledge of system operation before undertaking any action. Knowledge of system operation and the relationship of individual components will be necessary to supplement evidence of ability to troubleshoot component faults. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards. Use of high precision, high reliability soldering techniques and handling of components, including application of anti-static equipment, must be demonstrated.
- Assessment should be made across a sufficient number of components to establish the ability to apply attained skills and knowledge across the full range of display, control and distribution system components with the aid of applicable maintenance manuals and data.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of components, that are applicable to the enterprise, from the following systems:
 - display systems, including EFIS, EICAS and ECAM
 - AFCS
 - autopilots (digital and analogue)
 - flight director (digital and analogue)

- flight management.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA284 Repair or overhaul aircraft instrument system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and knowledge of component repair and overhaul procedures relating to fixed and rotary wing aircraft instrument system components that are repaired or overhauled in aviation maintenance workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Component Workshop Maintenance Stream) training pathway.

Repair of circuit boards is covered by MEA262 Modify/repair aircraft component single layer printed circuit boards and MEA263 Modify/repair aircraft multi-layer printed circuit boards.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA260	Use electrical test equipment
MEA261	Use electronic test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Determine requirements | 1.1 Component defect reports (removal tags) or customer order are correctly interpreted and matched by part and serial numbers |
| | 1.2 System components are inspected and/or operated through prescribed test procedures to establish serviceability or confirm defects, as required |
| | 1.3 Modification status is clearly established to assist in determining the overhaul requirements for the components |
| | 1.4 Extent of overhaul or repair is correctly identified and documented |
| 2. Troubleshoot instrument system components | 2.1 Available information from maintenance records and test results is used, where necessary, to assist in fault determination |
| | 2.2 Logical processes are used to ensure efficient and accurate troubleshooting |
| | 2.3 Specialist advice is obtained, where required, to assist with, or confirm, the fault and rectification requirement |
| | 2.4 System component faults are located and the causes of the faults are clearly identified |
| | 2.5 Fault rectification requirements are determined to assist in planning the repair |
| 3. Dismantle and inspect instrument system components | 3.1 System component parts are dismantled in accordance with maintenance manuals while observing all relevant work health and safety (WHS) requirements |
| | 3.2 Component parts are assessed for serviceability in accordance with the relevant maintenance documentation |
| | 3.3 Parts requiring specialist repair are tagged and repair instructions are accurately specified |

- | | | |
|---|-----|---|
| | 3.4 | Parts lists are compiled and processed in accordance with standard enterprise procedures |
| 4. Repair and/or modify instrument system components | 4.1 | System component parts are repaired or replaced in accordance with the relevant maintenance documentation |
| | 4.2 | Modification of components or parts is undertaken, where required, by relevant manufacturer's bulletins or procedures |
| 5. Assemble, test and adjust instrument system components | 5.1 | Assembly of component parts is carried out within specified tolerances and in accordance with the appropriate maintenance documents |
| | 5.2 | System components are adjusted or calibrated to operate within prescribed specifications |
| | 5.3 | Finished components are tagged, sealed and packaged in accordance with specified procedures |
| | 5.4 | Required maintenance documentation and modification records are completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

System components include:

- General instrument components, including mechanical instruments, electro-mechanical instruments and sensors

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA284 Repair or overhaul aircraft instrument system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved repair/overhaul procedures and processes relating to instrument system components
- recognising the serviceability state and repair or overhaul requirements for:
 - mechanical instruments
 - electro-mechanical instruments
 - instrument sensors
- applying logic processes, and using test equipment and appropriate wiring diagrams and manuals to isolate components faults
- performing component testing to isolate/confirm component fault and assess post-repair/overhaul serviceability
- correctly disassembling, inspecting component parts, repairing/ replacing/modifying component parts and assembling components listed above
- correctly interpreting instrument and display information, symbols and readings.

It is essential that system component testing procedures, cleanliness requirements and safety precautions applicable to the instrument system components being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to repair is essential. This may be demonstrated through application across a representative range from within the components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component and system operation

- the basic function and operation of the following components to enable testing for fault isolation/confirmation, to determine repair or overhaul requirements, and serviceability status post-repair or overhaul:
 - mechanical instruments
 - electro-mechanical instruments
 - instrument sensors
- basic principles/functions relating to the above components and associated with:
 - alternating current (AC) and direct current (DC) synchronous systems
 - servomechanisms
 - gyroscopes
 - vacuum and pressure-based indication methods (pitot/static and pressurisation)
 - advanced analogue fundamentals
- electro-mechanical sensor signal generation.

Assessment Conditions

- Competency should be assessed in the work environment, or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that general and special-purpose tools and test equipment would be used where appropriate.
- Ability to assess component serviceability and interpret parts requirements will be necessary to supplement the required evidence. The application of testing procedures should also clearly indicate knowledge of system operation before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of general instrument components, including:
 - mechanical instruments, electro-mechanical instruments and sensors
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA285 Repair or overhaul aircraft radio frequency communication and navigation system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, test equipment and knowledge of analogue and digital theory to repair or overhaul radio frequency (RF) components from aircraft communication and navigation systems.

Applications include RF communications and navigation system components from fixed and rotary wing aircraft that are repaired or overhauled in aviation maintenance workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Component Workshop Maintenance Stream) training pathway.

Repair of circuit boards is covered by MEA262 Modify/repair aircraft component single layer printed circuit boards and MEA263 Modify/repair aircraft component multi-layer printed circuit boards.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA260 Use electrical test equipment

MEA261 Use electronic test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Determine requirements | 1.1 Communication and navigation system component defect reports (removal tags) or customer order are correctly interpreted and matched by part and serial numbers |
| | 1.2 Circuitry is correctly prepared and connected to the applicable test equipment and is functionally tested or cycled through the prescribed test procedures in accordance with the maintenance documentation for evidence of serviceability or malfunction |
| | 1.3 Modification status is clearly established to assist in determining the overhaul requirements for the components |
| | 1.4 Extent of overhaul or repair is correctly identified and documented |
| 2. Troubleshoot RF communication and navigation system components | 2.1 Available information from maintenance records and inspection and test results is used, where necessary, to assist in fault determination |
| | 2.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting |
| | 2.3 Faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required |
| | 2.4 Fault rectification requirements are determined |
| 3. Dismantle and inspect RF communication and navigation system components | 3.1 Component parts are dismantled in accordance with maintenance manuals while observing all relevant work health and safety (WHS) requirements |
| | 3.2 Component parts are assessed for serviceability in accordance with the relevant maintenance documentation |

- 3.3 Parts requiring specialist repair are tagged and repair instructions are accurately specified
 - 3.4 Parts lists are compiled and processed in accordance with standard enterprise procedures
 4. Repair and/or modify RF communication and navigation system components
 - 4.1 Component parts are repaired or replaced in accordance with the relevant maintenance documentation
 - 4.2 Modification of components or parts is undertaken, where required, by relevant manufacturers' bulletins or procedures
 5. Assemble, test and adjust RF communication and navigation system components
 - 5.1 Assembly of component parts is carried out in accordance with specified tolerances and the applicable maintenance documents
 - 5.2 Assembled components are tested and adjusted/aligned in accordance with the applicable maintenance documentation using the appropriate test equipment
 - 5.3 Required maintenance documentation and modification records are completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Communication and navigation system components are from any or all of the following aircraft

- Very high frequency (VHF) communications
- High frequency (HF) communications
- Ultra-high frequency (UHF) communications
- Satellite communications

systems:

- Emergency location transmitter (ELT)
- Aeronautical Radio Incorporated (ARINC) Communication Addressing and Reporting System
- Intercommunication and public address
- Automatic direction finding (ADF) navigation
- Very high frequency omni-directional range (VOR) navigation
- Instrument landing system (ILS)
- Ground positioning system (GPS)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

MEA286 Repair or overhaul aircraft electrical/electro-mechanical components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and knowledge of component repair and overhaul procedures relating to electrical and electro-mechanical components of fixed and rotary wing aircraft that are repaired or overhauled in aviation maintenance workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit of competency is part of the Avionic Certificate IV (Component Workshop Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA201 Remove and install miscellaneous aircraft electrical hardware

MEA260 Use electrical test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Determine requirements
 - 1.1 Component defect reports (removal tags) or customer order are correctly interpreted and matched by part and serial numbers
 - 1.2 Components are inspected and/or operated through prescribed test procedures to establish serviceability or confirm defects, as required
 - 1.3 Modification status is clearly established to assist in determining the overhaul requirements for the components
 - 1.4 Extent of overhaul or repair is correctly identified and documented
2. Troubleshoot electrical/electro-mechanical components
 - 2.1 Available information from maintenance records and test results is used, where necessary, to assist in fault determination
 - 2.2 Logical processes are used to ensure efficient and accurate troubleshooting
 - 2.3 Specialist advice is obtained, where required, to assist with, or confirm, the fault and rectification requirement
 - 2.4 Electrical/electro-mechanical component faults are located and the causes of the faults are clearly identified
 - 2.5 Fault rectification requirements are determined to assist in planning the repair
3. Dismantle and inspect electrical/electro-mechanical components
 - 3.1 Component parts are dismantled in accordance with maintenance manuals while observing all relevant work health and safety (WHS) requirements
 - 3.2 Component parts are assessed for serviceability in accordance with the relevant maintenance documentation
 - 3.3 Parts requiring specialist repair are tagged and repair instructions are accurately specified
 - 3.4 Parts lists are compiled and processed in accordance with standard enterprise procedure
4. Repair and/or modify electrical/electro-mechanical
 - 4.1 Component parts are repaired or replaced in accordance with the relevant maintenance documentation

- | | | |
|--|-----|---|
| components | 4.2 | Modification of components or parts is undertaken, where required, by relevant manufacturer's bulletins or procedures |
| 5. Assemble, test and adjust electrical/ electro-mechanical components | 5.1 | Assembly of component parts is carried out within specified tolerances and in accordance with the appropriate maintenance documents |
| | 5.2 | Components are adjusted or calibrated to operate within prescribed specifications |
| | 5.3 | Finished components are tagged, sealed and packaged in accordance with specified procedures |
| | 5.4 | Required maintenance documentation and modification records are completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Assessment Requirements for MEA286 Repair or overhaul aircraft electrical/electro-mechanical components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved repair/overhaul procedures and processes relating to electrical and electro-mechanical components
- recognising the serviceability state and repair or overhaul requirements for:
 - alternating current (AC) and direct current (DC) motors, generators and alternators
 - static inverters
 - TRU
 - regulators/control units
 - actuators
 - solenoids and shutoff valves
 - engine ignition/starting components
- applying logic processes, and using test equipment and appropriate wiring diagrams and manuals to isolate component faults
- performing component testing to isolate/confirm component fault and assess post-repair/overhaul serviceability
- correctly disassembling, inspecting component parts, repairing/replacing/modifying component parts and assembling components listed above.

It is essential that component testing procedures, cleanliness requirements and safety precautions applicable to the system component being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to repair is essential. This may be demonstrated through application across a range of aircraft electrical/electro-mechanical components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component and system operation
- the basic function and operation of components listed below to enable testing for fault isolation/confirmation, to determine repair or overhaul requirements, and serviceability status post repair or overhaul:
 - AC and DC motors, generators and alternators
 - static inverters
 - TRU
 - regulators/control units
 - actuators
 - solenoids and shutoff valves
 - engine ignition/starting components
- basic principles/functions, relating to components listed above and associated with:
 - AC and DC power generation
 - circuit theory
 - analogue fundamentals
- electro-mechanical interface.

Assessment Conditions

- Competency should be assessed in the work environment, or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that applicable general and special-purpose tools and test equipment would be used where appropriate.
- Ability to assess component serviceability and interpret parts requirements will be necessary to supplement the required evidence. The application of testing procedures should also clearly indicate knowledge of system operation before undertaking any action. Knowledge of system operation and the relationship of individual components will be necessary to supplement evidence of ability to troubleshoot component faults. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) component from each of the following groups:
 - motors, generators and alternators
 - static inverters, TRU and regulators
 - actuators, solenoids and shutoff valves
 - bus bars, circuit breakers, connectors, electrical looms and fans.

- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA287 Repair or overhaul aircraft oxygen system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, maintenance publications, test equipment and knowledge of oxygen component maintenance and hygiene requirements to repair and overhaul aircraft oxygen system components from fixed and rotary wing aircraft that are repaired or overhauled in aviation maintenance workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

This unit of competency is part of the Avionic Certificate IV (Component Workshop Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Determine requirements | 1.1 Component defect reports (removal tags) or customer order are correctly interpreted and matched by part and serial numbers |
| | 1.2 System components are inspected and/or operated through prescribed test procedures to establish serviceability or confirm defects, as required |
| | 1.3 Modification status is clearly established to assist in determining the overhaul requirements for the components |
| | 1.4 Extent of overhaul or repair is correctly identified and documented |
| 2. Troubleshoot oxygen system components | 2.1 Available information from maintenance records and test results is used, where necessary, to assist in fault determination |
| | 2.2 Logical processes are used to ensure efficient and accurate troubleshooting |
| | 2.3 Specialist advice is obtained, where required, to assist with, or confirm, the fault and rectification requirement |
| | 2.4 System component faults are located and the causes of the faults are clearly identified |
| | 2.5 Fault rectification requirements are determined to assist in planning the repair |
| 3. Dismantle and inspect oxygen system components | 3.1 System component parts are dismantled in accordance with maintenance manuals while observing all relevant work health and safety (WHS) requirements |
| | 3.2 Component parts are assessed for serviceability in accordance with the relevant maintenance documentation |
| | 3.3 Parts requiring specialist repair are tagged and repair instructions are accurately specified |
| | 3.4 Parts lists are compiled and processed in accordance with |

			standard enterprise procedures
4.	Repair and/or modify oxygen system components	4.1	System component parts are repaired or replaced in accordance with the relevant maintenance documentation
		4.2	Modification of components or parts is undertaken, where required, by relevant manufacturer's bulletins or procedures
5.	Assemble, test and adjust oxygen system components	5.1	Assembly of component parts is carried out within specified tolerances and in accordance with the appropriate maintenance documents
		5.2	System components are adjusted or calibrated to operate within prescribed specifications
		5.3	Finished components are tagged, sealed and packaged in accordance with specified procedures
		5.4	Required maintenance documentation and modification records are completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Oxygen system components and related activities include:

- Pressure vessels (testing and charging)
- Regulators, control valves and indicators
- Chemical oxygen generators
- Product hygiene

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA287A Repair or overhaul aircraft oxygen system components

Assessment Requirements for MEA287 Repair or overhaul aircraft oxygen system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved repair/overhaul procedures and processes relating to oxygen components
- recognising the serviceability state and repair or overhaul requirements for oxygen pressure cylinders, valves, gauges, chemical generators, regulators, masks, pipes, hoses and fittings, and liquid dry breathing oxygen (LDBO) converters
- applying logic processes, and using test equipment and appropriate wiring diagrams and manuals to isolate component faults
- performing component testing to isolate/confirm component fault and assess post-repair/overhaul serviceability
- correctly disassembling, inspecting component parts, repairing/replacing/modifying component parts and assembling oxygen components
- applying product hygiene procedures.

The underlying skills inherent in this unit should be transferable across a range of repair or overhaul applications associated with oxygen system components. It is essential that the maintenance procedures are interpreted and applied to ensure quality and safety standards are fully observed, understood and complied with. Capability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

Evidence of transferability of skills and knowledge related to repair is essential. This may be demonstrated through application across a representative range of oxygen components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component and system operation
- the basic function and operation of oxygen components to enable testing for fault isolation/confirmation, to determine repair or overhaul requirements, and serviceability status post-repair or overhaul
- basic principles/functions relating to oxygen components and associated with:

- pressure sensitive devices (bellows and controllers)
- vacuum system generation
- atmosphere and its properties.

Assessment Conditions

- Competency should be assessed in the work environment, or simulated work environment, using tools and equipment specified in maintenance manuals. It is also expected that applicable general and special-purpose tools and test equipment would be used where appropriate.
- Ability to assess component serviceability and interpret parts requirements will be necessary to supplement the required evidence. The application of testing procedures should also clearly indicate knowledge of system operation before undertaking any action. Knowledge of system operation and the relationship of individual components will be necessary to supplement evidence of ability to troubleshoot component faults. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision across the following groups:
 - pressure vessels (testing and charging)
 - regulators, control valves and indicators
 - chemical oxygen generators
 - product hygiene.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA288 Repair or overhaul aircraft audio and visual systems and reproducers

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and knowledge of component repair and overhaul procedures relating to aircraft analogue and digital passenger entertainment electronic equipment components that are repaired or overhauled in aviation maintenance workshops during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Component Workshop Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA260 Use electrical test equipment

MEA261 Use electronic test equipment

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Determine requirements
 - 1.1 Audio and video system and reproducer component defect reports (removal tags) or customer order are correctly interpreted and matched by part and serial numbers
 - 1.2 Circuitry is correctly prepared and connected to the applicable test equipment and is functionally tested or cycled through the prescribed test procedures in accordance with the maintenance documentation for evidence of serviceability or malfunction
 - 1.3 Modification status is clearly established to assist in determining the overhaul requirements for the components
 - 1.4 Extent of overhaul or repair is correctly identified and documented
2. Dismantle and inspect audio and video system and reproducer components
 - 2.1 Component parts are dismantled in accordance with maintenance manuals while observing all relevant work health and safety (WHS) requirements
 - 2.2 Component parts are assessed for serviceability in accordance with the relevant maintenance documentation
 - 2.3 Parts requiring specialist repair are tagged and repair instructions are accurately specified
 - 2.4 Parts lists are compiled and processed in accordance with standard enterprise procedures
3. Repair and/or modify audio and video system and reproducer
 - 3.1 Component parts are repaired or replaced in accordance with the relevant maintenance documentation
 - 3.2 Modification of components or parts is undertaken, where required, by relevant manufacturers' bulletins or procedures
4. Assemble, test and adjust audio and video system and reproducer components
 - 4.1 Assembly of component parts is carried out in accordance with specified tolerances and the applicable maintenance documents
 - 4.2 Assembled components are tested and adjusted in accordance with the applicable maintenance documentation using the appropriate test equipment
 - 4.3 Required maintenance documentation and modification records are completed and processed in accordance with

standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Audio and video systems and reproducers include:

- Video cassette recorders (VCRs)
- Video display systems
- Cathode ray tube (CRT) display systems
- Symbol generators
- Audio amplifiers
- Audio and video selectors
- Voice recorders
- Microphones
- Head sets
- Passenger control units (PCUs)
- Tape reproducers (and tape reproduction)
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Assessment Requirements for MEA288 Repair or overhaul aircraft audio and visual systems and reproducers

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved repair/overhaul procedures and processes relating to analogue and digital circuitry
- recognising the serviceability state and repair or overhaul requirements for digital electronic interface systems:
 - VCRs
 - video display systems
 - CRT display systems
 - symbol generators
 - audio amplifiers
 - audio selectors
 - voice recorders
 - microphones
 - head sets
 - PCUs
 - tape reproducers (and tape reproduction)
- applying logic processes, and using test equipment and appropriate wiring diagrams and manuals to isolate component faults
- performing component testing to isolate/confirm component fault and assess post-repair/overhaul serviceability.

It is essential that component testing procedures, cleanliness requirements and safety precautions applicable to the components being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to repair, modification and overhaul is essential. This may be demonstrated through application across a range of components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component and system operation
- the basic function and operation of audio and visual and reproducer components to enable testing for fault isolation/confirmation to determine repair or overhaul requirements, and serviceability status post-repair or overhaul
- basic principles/functions relating to audio and visual and reproducer components and associated with:
 - advanced analogue fundamentals
 - basic logic and semiconductor theory
 - digital fundamentals
 - electrostatic discharge (ESD) precautions
 - alternating current (AC) and direct current (DC) electrical systems
 - video display theory
 - video recorder theory
 - cleaning and maintenance techniques for video and recorder heads
 - aircraft display systems
 - symbol generation
 - vector and raster graphics
 - audio circuit theory
 - sound measurement
 - decibel (dB) level standards
 - audio tape control signals and recording techniques
 - basic logic and semiconductor theory
- cleaning and maintenance techniques for audio recorder heads.

Assessment Conditions

- Competency should be assessed in the work environment, or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that applicable general and special-purpose tools and test equipment would be used where appropriate.
- The application of testing procedures should also clearly indicate knowledge of system operation before undertaking any action. Knowledge of system operation and the relationship of individual components will be necessary to supplement evidence of ability to troubleshoot component faults. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards. Use of high precision, high reliability soldering techniques and handling of components, including application of anti-static equipment, must be demonstrated.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on an item from each of the following groups:
 - VCRs
 - video display systems
 - CRT display systems
 - symbol generators
 - audio amplifiers
 - audio and video selectors
 - voice recorders
 - microphones
 - head sets
 - PCUs
 - tape reproducers (and tape reproduction).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA289 Maintain basic light aircraft avionic systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the maintenance of basic aircraft avionic systems and components involving inspection, testing and troubleshooting and component removal and installation.

Applications include basic fixed wing and rotary wing aircraft where the avionic systems are limited to very high frequency (VHF) communications, basic audio system, automatic direction finding (ADF) and very high frequency omni-range (VOR) radio navigation systems, stand-alone global navigation systems (GNS), air traffic control (ATC) transponder and automatic dependent surveillance-broadcast (ADS-B) during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the small aircraft maintenance Certificate IV Mechatronics training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Inspect basic aircraft avionic systems and components | 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 Avionic systems are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements |
| | 1.4 Defects are correctly identified and reported |
| 2. Test/adjust basic aircraft avionic systems | 2.1 Aircraft and systems are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 Avionic systems are functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate |
| 3. Troubleshoot basic aircraft avionic systems | 3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting using test sets, maintenance data and fault-finding charts or similar, to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 System faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required and in accordance with standard enterprise procedures |

- 3.5 Rectification requirements are determined
4. Remove and install basic aircraft avionic system components
- 4.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted where necessary to ensure personnel safety
- 4.2 Avionic component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements
- 4.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
- 4.4 Removed components are tagged and packaged in accordance with specified procedures
- 4.5 Avionic components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
- 4.6 Physical installation of avionic components is performed in accordance with the applicable maintenance manual
- 4.7 System is reinstated to correct operational condition in preparation for testing and calibration or adjustment, as necessary
- 4.8 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Avionic systems include:**
- VHF communication
 - Basic audio systems, such as intercom and audio

- selection
- ADF
 - VOR
 - Stand-alone GNS
 - ATC transponder
 - ADS-B
 - ELT
- Avionic components include:**
- Transmitters and receivers
 - Antennas and antenna cables
 - Control boxes and frequency selectors
 - Speakers
 - Switches
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA289A Maintain basic light aircraft avionic systems and components

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA289 Maintain basic light aircraft avionic systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the avionic system being maintained
- locating and identifying avionic system components comprising:
 - VHF communications systems
 - VOR and ADF navigation systems
 - basic audio systems
 - stand-alone GNS systems
 - ATC transponders
 - ADS-B
 - ELT systems
- locating and identifying applicable antennas
- recognising system and component defects/external damage, correct installation, attaching hardware (including cabling/harnesses/transmission lines) and security in the systems listed above
- applying logic processes, taking and interpreting system measurements to accurately and effectively isolate malfunctions within the above systems
- testing listed systems to isolate system faults and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the avionic system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting and component removal and installation is essential. This is to be demonstrated through application across a range of avionic systems and components as specified in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection of hardware, and plugs
- handling precautions for electrostatic sensitive devices
- the basic layout (block diagram level), function and operation of:
 - VHF communications systems
 - VOR and ADF navigation systems
 - basic audio systems
 - stand-alone GPS systems
 - ATC transponders
 - ADS-B
 - ELT systems
- basic principles/functions, relating to the above systems and associated with:
 - electromagnetic radiation and propagation
 - basic AC and DC circuit theory
 - printed circuit boards
 - digital fundamentals
 - analogue fundamentals
 - transmitter and receiver principles
 - pulse
 - antenna characteristics
 - transmission line characteristics
 - fibre optic communications
- maintenance requirements and troubleshooting procedures
- applicable maintenance data and manuals
- relevant WHS practices
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.

- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on each of the following systems and on at least one (1) major component/line replaceable unit (LRU) in each case:
 - VHF communication
 - basic audio systems, such as intercom and audio selection
 - ADF
 - VOR
 - stand-alone GPS
 - ATC transponder
 - ADS-B
 - ELT.
- Component removal and installation competencies are to be demonstrated on at least one (1) component from each of:
 - transmitters and receivers
 - antennas and antenna cables
 - control boxes and frequency selectors
 - speakers
 - switches.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA290 Fit avionic modification sheet metal components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance publications and modification documentation to perform sheet metal work associated with avionic modifications being incorporated on small fixed and rotary wing aircraft during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

This unit of competency is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activities
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Prepare to fit avionic modification sheet metal components | 1.1 Applicable sheet metal components are identified in accordance with applicable modification instructions and maintenance documentation |
| | 1.2 All required materials and equipment are selected and organised in accordance with the applicable modification instructions and maintenance documentation |
| 2. Fit avionic modification sheet metal components | 2.1 Sheet metal components are fitted in accordance with the modification instructions, ensuring that aircraft standard practices are used and standard process requirements are carried out while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and personal protective equipment (PPE) |
| | 2.2 Work area is cleaned of all waste material |
| 3. Complete modification activities | 3.1 Required documentation is accurately completed and correctly processed in accordance with enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Sheet metal components include:

- Doublers for the installation of antennas
- Brackets for the installation of avionic system components

- Procedures and requirements include:**
- Racks for components, such as transmitters/receivers
 - Hardware for the support of antenna cables and system electrical wiring
 - Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA290 Fit avionic modification sheet metal components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the use of MSDS and PPE
- using enterprise procedures, approved maintenance documentation and aircraft publications relating to aircraft sheet metal components
- identifying various aircraft metals used for sheet metal components and their basic metallurgy properties by interpretation of markings, numbering systems or visual, chemical or mechanical means
- handling and storing aircraft metals used for sheet metal components, including sealing agents, to industry standards
- identifying aircraft sheet metal assembly fasteners (metal and non-metallic) by interpretation of markings, numbering systems, size, shape and colour
- correctly interpreting, modification drawings and hand sketches
- using appropriate hand tools and machines to fit avionic modification sheet metal components to the aircraft
- freehand precision hole generation
- applying corrosion prevention techniques during component fitment
- restoring sealing and surface finishes.

The underlying skills inherent in this unit should be transferable into other areas that require similar techniques. It is essential that procedures take into account all safety precautions and quality requirements, standards and practices, and processes associated with assembly.

Evidence of knowledge about enterprise procedures relating to avionic modification incorporation and practices relating to associated sheet metal component installation will be necessary to supplement evidence of ability to fit a range of sheet metal components in a specific application.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- aircraft sheet metal component construction principles

- identification of primary, secondary and tertiary structure
- aircraft sheet metal assembly fasteners, their characteristics and identification
- fits and clearances for fasteners
- fitting methods for fasteners
- use of grip pins
- corrosion of aircraft structure and its prevention
- application of surface finishes
- relevant WHS procedures
- how to obtain MSDS
- use of PPE.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved on the following range of sheet metal components:
 - doublers for the installation of antennas
 - brackets for the installation of avionic system components
 - racks for components, such as transmitters/receivers
 - hardware for the support of antenna cables and system electrical wiring.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA291 Inspect, test and troubleshoot fixed wing single axis autopilot systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot fixed wing aircraft single axis autopilot systems (including those with radio navigation system interfaces) and components during scheduled or unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Avionic Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA207 Remove and install aircraft electronic system components

MEA246 Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Inspect fixed wing single axis autopilot systems and components
 - 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements
 - 1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements
 - 1.3 Single axis autopilot system and components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual
 - 1.4 Defects are correctly identified and reported
2. Test/adjust fixed wing single axis autopilot systems and components
 - 2.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
 - 2.2 Autopilot systems are functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction
 - 2.3 System calibration or adjustments are performed in accordance with maintenance manual, as appropriate
3. Troubleshoot fixed wing single axis autopilot systems
 - 3.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination
 - 3.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting
 - 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process, using fault-finding charts or similar, to line replacement level
 - 3.4 Autopilot system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures
 - 3.5 Rectification requirements are determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA291A Inspect, test and troubleshoot fixed wing single axis autopilot systems and components

Assessment Requirements for MEA291 Inspect, test and troubleshoot fixed wing single axis autopilot systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using approved maintenance documentation and aircraft publications relating to the single axis autopilot system being maintained
- recognising system and component defects/external damage, correct installation, connection of plugs, terminations, attaching hardware (including cabling/harnesses) and security in:
 - autopilot system components
 - radio navigation system interfaces
- applying logic processes, taking and interpreting system measurements, and using test equipment and appropriate wiring diagrams and manuals, to accurately and effectively isolate system malfunctions
- testing the system to isolate system malfunctions and assess post-maintenance serviceability.

It is essential that system testing procedures, cleanliness requirements and safety precautions applicable to the autopilot system being maintained are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) is critical.

Evidence of transferability of skills and knowledge related to inspection, testing and troubleshooting is essential. This is to be demonstrated through application across an autopilot system and its components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- the basic layout (block diagram level), function and operation of:

- autopilot system components
- interface with radio navigation systems
- autopilot system maintenance requirements and troubleshooting procedures
- relevant WHS practices
- basic principles/functions, relating to the listed systems and associated with:
 - basic AC and DC circuit theory
 - digital fundamentals
 - analogue fundamentals
 - fixed wing flight theory
 - inner and outer loop control
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in the maintenance manuals. It is also expected that applicable general and special-purpose tools, test and ground support equipment, would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- Applicable skills and knowledge gained through the attainment of similar or related competencies must be taken into consideration during assessment.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on an autopilot system and its components. This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
-

MEA301 Perform aircraft flight servicing

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and standard trade practices in the performance of pre and post-flight servicing activities and the application of aircraft ground handling procedures on both fixed and rotary wing aircraft.

The unit is part of Avionic and Mechanical Certificate IV (Aircraft Maintenance Stream) training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---------------------------------|---|
| 1. Prepare for flight | 1.1 Aircraft is positioned as required |
| | 1.2 Ground locks, aircraft support and safety devices and covers are removed and stowed in accordance with maintenance documentation |
| | 1.3 Aircraft tie-down devices are removed and stowed/stored |
| 2. Inspect aircraft and systems | 2.1 Preparation of the aircraft and systems is appropriate to allow for proper inspection |
| | 2.2 Aircraft and systems are visually or physically checked for external signs of defects in accordance with maintenance documentation while observing all relevant work health and safety (WHS) requirements |
| 3. Replenish aircraft systems | 3.1 Fluid level checks and replenishments are carried out in accordance with maintenance documentation requirements while observing all relevant WHS requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 3.2 Maintenance of gaseous levels (nitrogen and compressed air) is carried out in accordance with maintenance documentation requirements while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 3.3 Role equipment/components requiring pre-flight replacement are changed as required by maintenance documentation |
| | 3.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Flight servicing activities are performed during:

- Preparation for flight following maintenance
- Before flight servicing
- After flight servicing
- Turn around servicing

Maintenance documentation includes:

- Maintenance manuals
- Servicing schedules
- Applicable airworthiness regulations
- Aircraft maintenance program

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA301C Perform aircraft flight servicing

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA301 Perform aircraft flight servicing

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- ground handling of aircraft
- using hand skills and tools to perform flight servicing activities
- correctly installing and securing of aircraft hardware
- locating, using and correctly stowing of aircraft safety and security equipment (includes ground locks, covers, support and safety devices and tie-down devices)
- applying ground power (where applicable)
- inspecting structure for damage and deterioration
- recognising external signs of component damage, leakage and security in aircraft systems
- recognising visual signs of damage, leakage and security with regard to engines and propellers (where applicable)
- refuelling the aircraft with the correct type, quantity and distribution of fuel
- checking and replenishing fluid level using the correct fluids
- recharging of gaseous levels using the correct support equipment and procedures
- checking fire protection systems (where applicable) for correct gas charge levels and portable fire extinguishers for serviceability and correct stowage
- replacing role equipment requiring pre-flight replacement
- using of maintenance data and manuals to determine flight servicing requirements and procedures
- applying standard procedures
- observing all relevant WHS procedures, including the use of MSDS and items of PPE.

It is essential that the specific aspects of the aircraft flight servicing are checked to ensure quality and safety standards are fully observed, understood and complied with. Safety precautions applicable to the system being maintained are to be fully observed. An understanding of system operation as it relates to the work must be demonstrated before undertaking any action.

Evidence of knowledge of system operation, recognition of defects and completion of documentation, the relationship of individual components and the links with other systems will be necessary to the extent required for completion of flight servicing before undertaking any action.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- the aircraft structure to the extent required to be able to recognise typical types of structural damage and deterioration during flight servicing activities
- system layout, operation and typical external signs of faults to the extent required to perform flight servicing activities
- aircraft flight servicing requirements
- ground de-icing of aircraft
- aircraft ground handling procedures, including towing and marshalling
- aircraft safety and security equipment, including:
 - ground locks
 - wheel chocks
 - covers
 - support and safety devices
 - tie-down devices and picketing
- types and characteristics of fuels and fuel additives
- types and characteristics of lubricants
- types and characteristics of hydraulic fluids
- WHS procedures relating to flight servicing activities
- how to obtain MSDS
- selection and use of PPE
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using procedures, tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on the following flight servicing that are applicable to the enterprise:
 - preparation for flight following maintenance
 - before flight servicing

- after flight servicing
- turn around servicing.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA302 Remove and install aircraft hydro-mechanical and landing gear system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway and may also be part of a Structures Certificate IV training pathway. It requires application of hand skills and standard trade practices in the removal and installation of aircraft hydro-mechanical system and landing gear components fitted to both fixed and rotary wing aircraft during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Remove hydro-mechanical system components | 1.1 Hydro-mechanical system is rendered safe and prepared in accordance with the applicable maintenance manual, including fitment of isolation tags, where necessary, to ensure personal safety |
| | 1.2 Removal of hydro-mechanical components is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.3 Required maintenance documentation is accurately completed and correctly processed |
| | 1.4 Removed components are tagged, sealed and packaged in accordance with specified procedures |
| 2. Remove landing gear components | 2.1 The aircraft is jacked as specified in the maintenance manual for landing gear component removal |
| | 2.2 Removal of components is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 2.3 Required maintenance documentation is accurately completed and correctly processed |
| | 2.4 Removed components are tagged, sealed and packaged in accordance with specified procedures |
| 3. Install hydro-mechanical system components | 3.1 Components to be installed are checked to confirm correct part numbers, serviceability and modification status |
| | 3.2 Component installation is carried out in accordance with |

- the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
- 3.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
4. Install landing gear components
- 4.1 Components to be installed are checked to confirm correct part numbers, serviceability and modification status
- 4.2 Component installation is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
- 4.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Hydro-mechanical systems include:

- Hydraulic systems
- Fuel systems

Components of hydro-mechanical systems include:

- Hydraulic accumulators, filters, reservoirs, valves, pumps, motors, actuators, regulators and direct reading gauges
- Fuel system filters, valves, pumps, rigid and flexible storage cells/tanks
- Rigid and flexible pipelines, hoses and fittings

Landing gear components include:

- Wheel assemblies or skids
- Brake units (not applicable to rotary wing aircraft with skids or floats)
- Struts/oleos (not applicable to rotary wing aircraft with

skids or floats)

Electrical interface includes: • Associated electrical loom terminations and/or plugs where components are electrically actuated or controlled

Procedures and requirements include: • Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA302C Remove and install aircraft hydro-mechanical and landing gear system components

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA302 Remove and install aircraft hydro-mechanical and landing gear system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills and tools to remove and install hydraulic and fuel system components
- jacking of the aircraft as required for landing gear component removal and installation
- correctly installing and securing of aircraft hardware
- using hand skills and tools to remove and install landing gear components and the correct handling of heavy components
- using maintenance manuals to prepare the aircraft for component removal and installation and correct interpretation of removal and installation instructions
- applying standard procedures
- observing all relevant WHS procedures including the use of MSDS and relevant items of PPE.

It is essential that system cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This may be demonstrated through application across a number of aircraft systems or aircraft types, but must cover a sufficient range of tasks to demonstrate familiarity with attachment methods, connection hardware and couplings peculiar to each type of system, and of safe handling of heavy components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- hydraulic fluids (mineral and synthetic) and handling precautions
- hydraulic seal types and applications
- how to locate and correctly remove and install components of hydraulic systems
- aircraft fuels and handling precautions
- fuel seal types and applications

- how to locate and correctly remove and install fuel system components
- electrical circuit isolation and plug removal and installation
- how to jack the aircraft for landing gear component removal and installation
- how to locate and correctly remove and install landing gear components, including the handling of heavy components
- WHS procedures relating to hydraulic systems, fuel systems and landing gear components
- how to obtain MSDS
- the selection and use of items of PPE
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using procedures, tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of system operation as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on each type of system and on at least one (1) component of each group listed in the Range of Conditions, as follows:
 - hydraulic systems – preparation of a system for safe component removal and replacement of at least one (1) component from each of the following groups of components:
 - hydraulic accumulators, filters, reservoirs, valves, pumps, motors, actuators, regulators and direct reading gauges
 - rigid and flexible pipelines, hoses and fittings
 - fuel systems – preparation of a system for safe component removal and replacement of at least one (1) component from each of the following groups of components:
 - fuel system filters, valves, pumps, rigid and flexible storage cells/tanks
 - rigid and flexible pipelines, hoses and fittings
 - landing gear components – one (1) each of:
 - wheel assemblies or skids
 - brake units
 - struts/oleos.
- Coverage of brakes and struts/oleos are not required where the aircraft is rotary wing and is fitted with skids or floats.

- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA303 Remove and install aircraft pneumatic system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance publications to remove and install aircraft pneumatic system components from pressurisation systems, air cycle air conditioning systems and fire-extinguishing systems of fixed and rotary wing aircraft during scheduled and unscheduled maintenance.

The unit of competency is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathways and may also be part of a Structures Certificate IV training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Remove pneumatic system components | 1.1 Pneumatic system is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety |
| | 1.2 Removal of components is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| | 1.4 Removed components are tagged, sealed and packaged in accordance with specified procedures |
| 2. Install pneumatic system components | 2.1 Components to be installed are checked to confirm correct part numbers, serviceability and modification status |
| | 2.2 Installation is carried out to pneumatic system in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 2.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Pneumatic components include:

- Filters, valves, pumps, motors, actuators and regulators
- Gauges (direct reading), temperature sensors, pressurisation controllers and temperature controllers
- Heat exchangers, pressure vessels, condensers, compressors, expansion turbines and humidifiers
- Rigid and flexible pipelines, hoses and fittings
- Ducting
- Fire-extinguishers, including those containing ozone depleting substances (ODS) or synthetic greenhouse gas (SGG) extinguishing agents (e.g. BCF) (where applicable to the enterprise)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA303D Remove and install aircraft pneumatic system components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA303 Remove and install aircraft pneumatic system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation and aircraft manuals to:
 - locate and correctly remove and install components in pneumatic systems, including fire-extinguishing systems
 - locate and correctly remove and install components in air cycle air conditioning systems
 - locate and correctly remove and install components in pressurisation systems
 - correctly remove and install rigid and flexible pipelines
 - correctly remove and install ducting
- observing regulations governing the handling and custody of fire-extinguishers containing ODS or SGG extinguishing agents (e.g. BCF).

It is essential that system cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This may be demonstrated through application across a number of aircraft systems or aircraft types, but must cover a sufficient range of tasks to demonstrate familiarity with attachment methods, connection hardware and couplings peculiar to each type of system, and of safe handling of heavy components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- connection hardware and couplings
- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- how to locate and correctly remove and install components of:
 - pneumatic systems

- air cycle air conditioning system components
- pressurisation system components
- fire-extinguishers, including the effect of ODS or SGG extinguishing agents and regulations covering special precautions and handling requirements for BCF fire-extinguishers
- electrical circuit isolation and plug removal and installation
- WHS procedures relating to pneumatic, air conditioning and pressurisation systems
- how to obtain MSDS
- the selection and use of items of PPE
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures, including those relating to the handling and control of halon fire-extinguishers.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of system operation as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on one (1) item from each from the following groups:
 - filters, valves, pumps, motors, actuators and regulators
 - gauges (direct reading), temperature sensors, pressurisation controllers and temperature controllers
 - heat exchangers, pressure vessels, condensers, compressors, expansion turbines and humidifiers
 - rigid and flexible pipelines, hoses and fittings
 - ducting
 - fire-extinguishers, including those containing ODS or SGG extinguishing agents (e.g. BCF) (may be omitted where not applicable to enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

- Individuals being assessed who have already attained MEA355 Maintain light aircraft air cycle air conditioning systems, and/or MEA356 Maintain light piston engine aircraft pressurisation systems, will have satisfied the requirements of this unit with regard to common Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA355 Maintain light aircraft air cycle air conditioning systems and MEA356 Maintain light piston engine aircraft pressurisation systems, may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

MEA304 Remove and install non-pressurised aircraft structural and non-structural components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and maintenance publications to remove and install structural and non-structural components from non-pressurised fixed and rotary wing aircraft during scheduled and unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway. It may also be part of a Structures Maintenance Certificate IV training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA302 Remove and install aircraft hydro-mechanical and landing gear system components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

- essential outcomes. demonstrate achievement of the element.
1. Remove components
 - 1.1 Structure is supported and prepared in accordance with the applicable maintenance manual to ensure personnel safety and freedom from damage to aircraft or component during component removal
 - 1.2 Component removal is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)
 - 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 1.4 Where applicable, removed components are tagged and prepared for transport in accordance with specified procedures
 2. Install components
 - 2.1 Structural and/or non-structural components to be installed are checked to confirm correct part numbers, serviceability and modification status
 - 2.2 Component installation is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 2.3 Support/safety equipment is removed at an appropriate time to ensure personnel safety and freedom from structural damage
 - 2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Removable components of structure include:

- Those that are installed using bolts and/or screws. Where component removal and installation requires the removal and installation of rivets the applicable unit is either MEA339 Inspect, repair and maintain aircraft structures, MEA369 Inspect and maintain structures and related components of non-pressurised small aircraft or MEA371 Perform major repairs and modifications to small aircraft metal structure.
- Removable components include:
 - removable components of wings, tail booms, pylons, empennage, skids, fairings and nacelles
 - removable components or sections of non-pressurised fuselages
 - non-pressurised fuselage entry, cargo, access doors and associated seals, including checking and adjustment of all doors and access panels and associated locking mechanisms
 - non-pressurised fuselage windows and transparent panels
 - where applicable, trim panels, linings, seats, cabin equipment and consoles, floor panels and coverings
 - applicable emergency equipment, including passenger escape systems, life jackets, rafts, location transmitters, beacons, crew and passenger seat restraints

Sealant removal and application includes:

- The removal and application of faying (contact or overlapping) surface and fuel tank sealants is included, where applicable

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA304 Remove and install non-pressurised aircraft structural and non-structural components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation and aircraft manuals to:
 - remove and install structural and non-structural components
 - remove and install aircraft interior fittings
 - remove and install doors, door seals, windows and transparent panels
 - checking and adjusting all doors and access panels, including locking mechanisms
- removing and installing emergency equipment.

It is essential that shoring, trestling and lifting requirements and safety precautions applicable to the structure being maintained are fully observed, understood and complied with.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This may be demonstrated through application across the component groups listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- structural and non-structural component methods of construction and attachment, faying surface treatment and fuel tank sealing
- non-pressurised fuselage aircraft doors, related seals and window and transparent panel construction, attachment methods and sealing
- aircraft interior fittings (trim, linings, seats, floor panels, and so on) construction and attachment methods
- the location and attachment or stowage methods for emergency equipment
- relevant WHS practices
- how to obtain MSDS
- use of PPE

- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of component handling, attachment methods, adjustment and sealing as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following component groups:
 - removable components of wings, tail booms, pylons, empennage, skids, fairings and nacelles
 - removable components or sections of non-pressurised fuselages
 - non-pressurised fuselage entry, cargo, access doors and associated seals, including checking and adjustment of all doors and access panels and associated locking mechanisms
 - non-pressurised fuselage windows and transparent panels
 - where applicable, trim panels, linings, seats, cabin equipment and consoles, floor panels and coverings
 - applicable emergency equipment, including passenger escape systems, life jackets, rafts, location transmitters, beacons, crew and passenger seat restraints.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

Assessment Requirements for MEA305 Remove and install aircraft fixed wing flight control system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices
- using relevant maintenance documentation and aircraft manuals to:
 - remove flight control surfaces
 - check the mass balance of control surfaces, where required
 - install flight control surfaces
 - remove power flight control system components
 - install power flight control system components
 - remove mechanical flight control system components
 - install mechanical flight control system components.

It is essential that safety precautions applicable to the fixed wing flight control system being maintained are fully observed, understood and complied with (especially flight control system inter-relationships with other systems where applicable). An awareness of dual inspection requirements associated with work on flight controls and systems must also be demonstrated.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This may be demonstrated through removal and installation of a representative range of the fixed wing flight control system components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- flight control surface and system component attachment methods
- connection hardware and couplings
- electrical circuit isolation and plug removal and installation
- requirements for balancing of control surfaces
- flight control system rigging requirements
- requirements for independent inspection of work performed on flight control systems and components

- relevant WHS practices
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of component attachment methods and the need for adjustment or rigging and system operation as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following component groups:
 - ailerons, elevators, rudders, trim tabs, speed brakes, spoilers, flaps and slats
 - actuators – mechanical, hydraulic, pneumatic or electric
 - mechanical flight control components (cables, pulleys, guides, fairleads, tension regulators, control rods, bellcranks, torque tubes, chains, sprockets, control sticks, wheels or columns, trim wheels or handles, rudder pedals).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA351 Maintain airframe systems of basic light fixed wing aircraft have satisfied the requirements of this unit with regard to common Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA351 Maintain airframe systems of basic light fixed wing aircraft may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

ME A306 Remove and install engines and engine system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance publications to remove and install gas turbine or piston engines and engine system components of fixed and rotary wing aircraft during scheduled and unscheduled maintenance.

Work may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

ME A101	Interpret work health and safety practices in aviation maintenance
ME A103	Plan and organise aviation maintenance work activity
ME A105	Apply quality standards applicable to aviation maintenance processes
ME A107	Interpret and use aviation maintenance industry manuals and specifications
ME A108	Complete aviation maintenance industry documentation
ME A109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|------------------------------------|--|
| 1. Remove engine | 1.1 Aircraft is prepared and supported and rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure the safety of personnel and freedom from damage during engine removal |
| | 1.2 Removal is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.3 Engine is tagged and prepared for transport or storage in accordance with the specified procedures |
| | 1.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 2. Remove engine system components | 2.1 Aircraft and/or engine system is prepared and rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure the safety of personnel |
| | 2.2 Removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 2.3 Engine system component is tagged and prepared for transport or storage in accordance with the specified procedures |
| | 2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 3. Install engine | 3.1 Engine to be installed is checked to confirm correct part or |

- model numbers, modification status and serviceability
- 3.2 Installation is carried out in accordance with the applicable maintenance manual
 - 3.3 Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage
 - 3.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
4. Install engine system components
 - 4.1 Engine components to be installed are checked to confirm correct part or model numbers, modification status and serviceability
 - 4.2 Installation is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 4.3 Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage
 - 4.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Engines and engine system components include:

- Engine change unit or auxiliary power unit (turbo-prop, turbofan, turboshaft, turbojet and piston)
- Fuel, oil and air system (or induction and super/turbo charger systems in the case of piston engine) components

- Engine control system components
- Ignition or igniter system components
- Starting system components
- Fire protection system components.
- Accessories and associated drives
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Assessment Requirements for MEA306 Remove and install engines and engine system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying WHS practices, including lifting and handling heavy components
- using MSDS and PPE
- using relevant maintenance documentation and aircraft manuals to:
 - correctly remove and install engines, engine change units and auxiliary power units (APUs)
 - prepare removed engines for transportation and/or storage
 - locate and correctly remove and install the range of engine system components listed in the Range of Conditions
- identifying the requirement for adjustment and rigging of systems and controls after the installation of engines or system components.

It is essential that safety precautions applicable to engines and engine systems being maintained are fully observed, understood and complied with, including allowance for the effect on aircraft centre of gravity when engines are removed. Awareness must be demonstrated of dual inspection requirements associated with work on engine control systems.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This may be demonstrated through removal and installation of a representative range of engines and engine system components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- removal and installation procedures for aircraft:
 - engines
 - engine change units
 - APUs
- engine inhibiting and de-inhibiting procedures
- layout, installation and connection of components of:

- fuel systems
- lubrication systems
- air systems
- super and turbo charging systems
- exhaust systems
- ignition and igniter systems
- starting systems
- fire protection systems
- accessories and associated drives
- engine control system component removal and installation, including the requirement for rigging and for the independent inspection of work performed
- engine maintenance documentation and manuals
- relevant WHS practices, including those relating to the lifting and handling of heavy items
- how to obtain MSDS
- use of PPE
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment, or by the use of simulated activities, using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of component attachment methods and the need for adjustment, rigging and system operation as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - engine change unit or auxiliary power unit (turbo-prop, turbofan, turboshaft, turbojet, piston)
 - fuel, oil and air system (or induction and super/turbo charger systems in the case of piston engine) components
 - engine control system components
 - ignition or igniter system components
 - starting system components
 - fire protection system components.
 - accessories and associated drives.

- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA353 Maintain basic light aircraft engines and propellers will have satisfied the requirements of this unit with regard to common Range Statement variables. The Log of Industrial Experience and Achievement records relating to MEA353 Maintain basic light aircraft engines and propellers may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

ME A307 Remove and install propeller systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance publications to remove and install fixed wing aircraft propellers and propeller system components during scheduled and unscheduled maintenance. Work may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

ME A101	Interpret work health and safety practices in aviation maintenance
ME A103	Plan and organise aviation maintenance work activity
ME A105	Apply quality standards applicable to aviation maintenance processes
ME A107	Interpret and use aviation maintenance industry manuals and specifications
ME A108	Complete aviation maintenance industry documentation
ME A109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--------------------------------------|---|
| 1. Remove propellers and components | <p>1.1 System is rendered safe and prepared in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices</p> <p>1.2 Isolation and warning signs are installed/fitted to ensure personnel safety and freedom from damage during component removal</p> <p>1.3 Propeller system component removal is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)</p> <p>1.4 Required aircraft maintenance documentation is accurately completed and correctly processed</p> <p>1.5 Removed components are labelled, sealed and packaged in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices</p> |
| 2. Install propellers and components | <p>2.1 Propeller system components to be installed are checked to confirm correct part numbers, serviceability and modification status</p> <p>2.2 Component installation is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices while observing all relevant WHS requirements, including the use of MSDS and items of PPE</p> <p>2.3 Support/safety equipment is removed at an appropriate time to ensure personnel safety and freedom from structural damage</p> |

- 2.4 Required aircraft maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Propeller system components include:

- Propellers, including spinners, where fitted
- Constant speed, feathering and reversing propeller drives
- Beta control systems and governors
- Controls and linkages
- De-ice/anti-ice equipment (where applicable to the enterprise)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Release 1 – equivalent to MEA307C Remove and install propeller systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA307 Remove and install propeller systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including lifting and handling heavy components
- using MSDS and PPE
- using relevant maintenance documentation and aircraft manuals to:
 - correctly remove and install propellers and related components, such as spinners
 - locate and correctly remove and install pitch control system components
 - locate and correctly remove and install propeller de-icing system components (where applicable to the enterprise)
- identifying requirements for adjustment and rigging of systems and controls.

It is essential that shoring, trestling and lifting requirements and safety precautions applicable to propeller system maintenance are fully observed, understood and complied with, and that an awareness is demonstrated of dual inspection requirements.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This may be demonstrated through application across a representative range of propeller system components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- propeller attachment methods and removal and installation procedures
- propeller system component attachment methods for:
 - spinners
 - governors
 - beta control systems
 - de-ice and anti-ice systems
- controls and control linkages including the requirement for rigging and for independent inspection of work performed
- electrical circuit isolation, plug removal and installation

- relevant WHS practices, including those relating to lifting and handling of heavy items
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of component attachment methods, the need for adjustment or rigging and system operation as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - propellers, including spinners, where fitted
 - constant speed, feathering and reversing propeller drives
 - beta control systems and governors
 - controls and linkages
 - de-ice/anti-ice equipment (may be omitted where it is not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA308 Remove and install rotary wing rotor and flight control system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance publications to remove and install rotary wing aircraft rotors and associated flight control system components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA302 Remove and install aircraft hydro-mechanical and landing gear system components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

- essential outcomes. demonstrate achievement of the element.
1. Remove rotary wing rotor
 - 1.1 System is rendered safe and prepared in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 - 1.2 Isolation and warning signs are installed/fitted to ensure personnel safety
 - 1.3 Rotary wing rotor removal is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices while observing all relevant work health and safety (WHS) requirements
 - 1.4 Required aircraft maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 1.5 Removed components are labelled, sealed and packaged in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 2. Remove rotary wing flight control system components
 - 2.1 System is rendered safe and prepared in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 - 2.2 Isolation and warning signs are installed/fitted to ensure personnel safety
 - 2.3 Rotary wing flight control system component removal is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices while observing all relevant WHS requirements
 - 2.4 Required aircraft maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 2.5 Removed components are labelled, sealed and packaged in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practice
 3. Install rotary wing rotor
 - 3.1 Rotor to be installed is checked to confirm correct part or model numbers, modification status and serviceability

- 3.2 Mass balance of rotor blades/head is checked in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 - 3.3 Installation is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices while observing all relevant WHS requirements
 - 3.4 Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage
4. Install rotary wing flight control system components
 - 4.1 Rotary wing flight control system components to be installed are checked to confirm correct part or model numbers, modification status and serviceability
 - 4.2 Installation is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices while observing all relevant WHS requirements
 - 4.3 Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage
 - 4.4 Required aircraft maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Rotary wing rotors and flight control system

- Main rotor blades and tail rotor blades
- Rotor heads

components include:

- Swash plates, and tail rotor pitch control assemblies
- Mechanical flight control components (i.e. cables, pulleys, guides, fairleads, tension regulators, control rods, bellcranks, torque tubes, control sticks or columns, tail rotor pedals) and mechanical components of powered flight control systems
- Main rotor, intermediate or tail rotor gearboxes
- Drive shafts and couplings

Powered flight controls

- In the case of hydraulically powered rotor control system components and related plumbing, maintenance work should be assessed against MEA302 Remove and install aircraft hydro-mechanical and landing gear system components

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA308C Remove and install rotary wing rotor and flight control system and components

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA308 Remove and install rotary wing rotor and flight control system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including lifting and handling heavy components
- using relevant maintenance documentation and aircraft manuals to:
 - correctly remove and install main rotors and rotor heads
 - check the mass balance of rotor blades and heads
 - correctly remove and install tail rotor blades and pitch control assemblies
 - locate and correctly remove and install mechanical flight control system components
 - locate and correctly remove and install drive train components, such as gearboxes and drive shafts and couplings
 - identify the requirements for component balancing
- identifying the requirements for adjustment and rigging of systems after component removal and installation.

It is essential that safety precautions applicable to the rotary wing rotor and flight control system components being maintained, including allowance for the effect on weight and balance (i.e. centre of gravity) when heavy components are removed, are fully observed, understood and complied with.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This may be demonstrated through removal and installation of a representative range of the rotary wing rotor and flight control system components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component attachment methods
- removal and installation procedures for:
 - main rotors and rotor blades
 - rotor heads

- tail rotors and tail rotor blades
- swash plates
- tail rotor pitch control assemblies
- requirements for the checking and adjustment of blade tracking after rotor maintenance
- control system layout, linkages and operation (operation only to the extent necessary for the specified tasks), including the requirement for rigging and the independent inspection of work performed
- power train layout and assembly:
 - main rotor gearboxes
 - intermediate gearboxes
 - tail rotor gearboxes
 - drive shafts
 - couplings
- relevant WHS practices, including those relating to lifting and handling of heavy items
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate
- An understanding of component attachment methods, the need for adjustment or rigging and system operation as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - main rotor blades and tail rotor blades
 - rotor heads
 - swash plates, tail rotor pitch control assemblies
 - mechanical flight control components (i.e. cables, pulleys, guides, fairleads, tension regulators, control rods, bellcranks, torque tubes, control sticks or columns, tail rotor pedals) and mechanical components of powered flight control systems
 - main rotor, intermediate or tail rotor gearboxes
 - drive shafts and couplings.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).

- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA352 Maintain basic rotary wing aircraft systems will have satisfied the requirements of this unit with regard to common Range Statement variables. The Log of Industrial Experience and Achievement records relating to MEA352 Maintain basic rotary wing aircraft systems may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

MEA309 Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, standard trade practices and systems knowledge in the inspection, testing and troubleshooting of aircraft hydro-mechanical and landing gear systems and components of fixed and rotary wing aircraft during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA302 Remove and install aircraft hydro-mechanical system and landing gear components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.		demonstrate achievement of the element.
1. Inspect hydro-mechanical systems and components	1.1	Isolation tags already attached to the system or related systems are checked and aircraft configured for safe system inspection and operation in accordance with specified procedures
	1.2	Hydro-mechanical system and system components are visually or physically checked for external signs of defects in accordance with specified procedures while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)
2. Inspect landing gear systems and components	2.1	Isolation tags already attached to the system or related systems are checked and aircraft configured, including jacking where necessary, for safe system inspection and operation in accordance with specified procedures
	2.2	Landing gear system and system components are visually or physically checked for external signs of defects in accordance with specified procedures while observing all relevant WHS requirements, including the use of MSDS and PPE
3. Test hydro-mechanical and landing gear systems	3.1	The aircraft and hydro-mechanical systems are correctly prepared, in accordance with specified procedures, for the application of power
	3.2	Power is applied and system functionally tested, in accordance with specified procedures, for evidence of malfunction or leaks
	3.3	System calibration or adjustments are performed in accordance with specified procedures
4. Prepare for troubleshooting	4.1	Relevant maintenance documentation and modification status, including system defect/ service difficulty reports where relevant, are interpreted to identify an unserviceability
5. Troubleshoot hydro-mechanical and landing gear systems	5.1	Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination
	5.2	Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level

- 5.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
- 5.4 Hydro-mechanical and landing gear system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required
- 5.5 Fault rectification requirements are determined to assist in planning the repair or adjustment

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Assessment Requirements for MEA309 Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills and tools in the inspection, adjustment and troubleshooting of hydraulic, fuel and landing gear systems
- using hand skills and tools in the inspection, adjustment and troubleshooting of hydraulic and fuel system components
- jacking of the aircraft, as required, for landing gear system inspection, testing and troubleshooting
- using hand skills and tools in the inspection, adjustment and troubleshooting of landing gear components
- using maintenance manuals to prepare the aircraft for inspection, testing and troubleshooting of hydro-mechanical and landing gear systems and components
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process
- recognising external defects in hydro-mechanical and landing gear systems and components
- applying standard procedures
- observing all relevant WHS practices, including the use of MSDS and PPE.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with aircraft hydro-mechanical and landing gear systems and their components.

It is essential that system test procedures take into account all safety precautions applicable to the system being maintained, especially where system operation/switching interrelates to other systems being maintained.

Ability to interpret system performance specifications (allowable limits) and apply them in practice is critical and shall be demonstrated through application across the range of systems listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- fluid power theory
- hydraulic system layout, operation and characteristics (including electrical system interfaces) and system component construction and operation for:
 - flight control systems including primary controls, flaps, speed brakes and spoilers
 - landing gear retraction systems
 - brake and anti-skid systems
 - nosewheel steering systems
- fuel system and component layout, operation and characteristics (including electrical system interfaces) and system component operation and construction
- construction and operation of landing gear components, including:
 - wheel assemblies
 - skids
 - floats
 - struts/oleos
 - uplocks and downlocks
 - mechanical linkages
- how to configure the aircraft for inspection, testing and troubleshooting of hydraulic, fuel and landing gear systems and components
- maintenance requirements and troubleshooting procedures
- relevant WHS practices relating to hydraulic systems, fuel systems and landing gear components, including lifting and handling of heavy items
- how to obtain MSDS
- selection and use of PPE
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using procedures, tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action.

- The work plan should take account of applicable safety (including safe handling of heavy components) and quality requirements in accordance with the industry and regulatory standards.
- The level of troubleshooting is limited in its application to the use of fault diagnosis guides or other similar information.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on each type of system:
 - hydraulic systems
 - fuel systems
 - retraction systems
 - steering systems
 - brake systems, including anti-skid, where applicable
- and on at least one (1) component from each of the following groups:
 - hydraulic accumulators, filters, reservoirs, valves, pumps, motors, actuators, regulators, direct reading gauges
 - fuel system filters, valves, pumps, rigid and flexible storage cells/tanks
 - rigid and flexible pipelines, hoses and fittings
 - wheel assemblies, skids and floats
 - brake units
 - struts/oleos.
- Where the aircraft is rotary wing and is fitted with skids or floats, coverage of retraction systems, steering systems and brake systems and their components is not required. Where a rotary wing aircraft is fitted with a fixed undercarriage with wheels, coverage of retraction and steering systems and their components is not required.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, standard trade practices and systems knowledge in the inspection, testing and troubleshooting of both fixed and rotary wing aircraft pneumatic systems and components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA303 Remove and install aircraft pneumatic system components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.	demonstrate achievement of the element.
1. Inspect pneumatic systems and components	1.1 Isolation tags already attached to the system or related systems are checked and aircraft configured for safe system inspection and operation in accordance with specified procedures 1.2 Pneumatic system is visually or physically checked for external signs of defects in accordance with specified procedures while observing all relevant work health and safety (WHS) requirements
2. Test pneumatic systems	2.1 The aircraft and pneumatic systems are correctly prepared in accordance with specified procedures for the application of power 2.2 Power is applied and system functionally tested in accordance with specified procedures for evidence of malfunction or leaks 2.3 System calibration or adjustments are performed in accordance with specified procedures
3. Prepare for troubleshooting	3.1 Relevant maintenance documentation and modification status, including system defect/service difficulty reports, where relevant, are interpreted to identify an unserviceability
4. Troubleshoot pneumatic systems	4.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination 4.2 Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level 4.3 Specialist advice is obtained, where required, to assist with the troubleshooting process 4.4 Pneumatic system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required 4.5 Fault rectification requirements are determined to assist in planning the repair or adjustment

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Pneumatic systems include:**
- De-icing
 - Air cycle air conditioning
 - Pressurisation
 - Fire-extinguishing
- Components of pneumatic systems include:**
- Filters, valves, pumps, motors, actuators and regulators
 - Gauges (direct reading), temperature sensors, pressurisation controllers and temperature controllers
 - Heat exchangers, pressure vessels, condensers, compressors, expansion turbines and humidifiers
 - Rigid and flexible pipelines, hoses and fittings
 - Ducting
- Electrical interface includes:**
- Associated electrical loom terminations and/or plugs
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills and tools in the inspection, adjustment and troubleshooting of pneumatic systems
- using hand skills and tools in the inspection, adjustment and troubleshooting of pneumatic system components
- using maintenance manuals to prepare the aircraft for inspection, testing and troubleshooting of pneumatic systems and components
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process
- recognising external defects in pneumatic systems and components
- applying standard procedures
- observing all relevant WHS practices.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with aircraft pneumatic systems and their components. It is essential that system test procedures take into account all safety precautions applicable to the system being maintained, especially where system operation/switching interrelates to other systems being maintained.

Ability to interpret system performance specifications (allowable limits) and apply them in practice is critical and shall be demonstrated through application across the range of systems listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- pneumatic system:
 - layout
 - operation and characteristics

- component operation and construction
- electrical and instrument system interfaces
- how to configure the aircraft for inspection, testing and troubleshooting of pneumatic systems and components
- pneumatic system maintenance requirements and troubleshooting procedures
- WHS procedures relating to pneumatic systems and components
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures, including those relating to the handling and control of halon fire-extinguishers.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using procedures, tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate. The level of troubleshooting is limited in its application to the use of fault diagnosis guides or other similar information.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on each type of system:
 - de-icing
 - air cycle air conditioning
 - pressurisation
 - fire-extinguishing
- and on at least one (1) component from each of the following groups:
 - filters, valves, pumps, motors, actuators and regulators
 - gauges (direct reading), temperature sensors, pressurisation controllers and temperature controllers
 - heat exchangers, pressure vessels, condensers, compressors, expansion turbines and humidifiers
 - rigid and flexible pipelines, hoses and fittings
 - ducting.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).

- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA355 Maintain light aircraft air cycle air conditioning systems, and/or MEA356 Maintain light piston engine aircraft pressurisation systems will have satisfied the requirements of this unit with regard to common Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA355 Maintain light aircraft air cycle air conditioning systems, and/or MEA356 Maintain light piston engine aircraft pressurisation systems may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

MEA312 Inspect, test and troubleshoot aircraft fixed wing flight control systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance publications and knowledge of system theory to inspect, test and troubleshoot fixed wing aircraft flight control system components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

This unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Flight control systems and system components include:

- Elevator, aileron and rudder primary flight control systems and associated trim systems
- Speed brake, spoiler, flap and high lift systems
- Ailerons, elevators, rudders, trim tabs, speed brakes, spoilers, flaps and slats
- Actuators – mechanical, hydraulic, pneumatic or electric
- Mechanical flight control components (cables, pulleys, guides, fairleads, tension regulators, control rods, bellcranks, torque tubes, chains, sprockets, control sticks, wheels or columns, trim wheels or handles, and rudder pedals)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA312 Inspect, test and troubleshoot aircraft fixed wing flight control systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures
- using relevant maintenance documentation and aircraft manuals to:
 - recognise defects during visual inspection of fixed wing flight control systems and system components
 - rig fixed wing flight control systems
 - functionally test the operation of fixed wing flight control systems and recognise system/component malfunction or evidence of incorrect rigging
- to the extent permitted by applicable fault diagnosis guides, troubleshooting unserviceabilities in fixed wing flight control systems and clearly recording the causes of the unserviceabilities.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with the aircraft fixed wing flight systems. It is essential that testing procedures take into account all safety precautions associated with flight control system operation, in particular where system operation/switching interrelates to other systems being maintained, and that an awareness be demonstrated of dual inspection requirements associated with work on flight controls and systems.

Ability to interpret system performance specifications (allowable limits) and apply them in practice is critical and shall be demonstrated through application across the range of systems listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS precautions relevant to flight control system maintenance
- standard trade practices relating to tool and test/rigging equipment usage and installation/securing of system components
- flight control system layout and operation:

- theory of flight:
 - airflow
 - conditions of flight
 - lift and forces
 - drag
 - wings, tailplane and vertical stabiliser
 - lift augmentation (flaps, slats and slots)
 - aircraft control surfaces and their function (elevator, ailerons, rudder, elevons and trim tabs)
 - spoilers and speed brakes
 - flight control balancing and flutter
 - stability and control and flight control rigging
- mechanical system layout and operation:
 - cockpit controls
 - cables and cable tensioning
 - pulleys and fairleads
 - bellcranks
 - levers
 - control surface horns
 - screwjacks
 - push/pull rods
- powered flight controls:
 - system layout and operation
 - component construction and operation
 - electrical and instrument interfaces:
 - flaps
 - trim
 - position indication
- flight control system maintenance procedures and troubleshooting methods
- flight control system interfaces with automatic pilot systems
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.

- The application of ground testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action.
- The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- Assessment conditions must also provide for knowledge of dual inspection requirements to be demonstrated.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of:
 - elevator, aileron and rudder primary flight control systems and associated trim systems
 - speed brake, spoiler, flap and high lift systems
 - ailerons, elevators, rudders, trim tabs, speed brakes, spoilers, flaps and slats
 - actuators – mechanical, hydraulic, pneumatic or electric
 - mechanical flight control components (cables, pulleys, guides, fairleads, tension regulators, control rods, bellcranks, torque tubes, chains, sprockets, control sticks, wheels or columns, trim wheels or handles, and rudder pedals).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA313 Inspect, test and troubleshoot piston engine systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, the use of maintenance publications, and knowledge of piston engine and system theory to inspect, test and troubleshoot fixed and rotary wing aircraft piston engines and engine system components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA306 Remove and install engine systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.

demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect piston engine system and components | 1.1 Isolation tags already attached to the system or related systems are checked and aircraft/engine configured for safe system inspection and operation in accordance with applicable maintenance manual |
| | 1.2 Piston engine and/or components are visually or physically checked for external and internal signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| 2. Test piston engine system | 2.1 Aircraft and engine system are correctly prepared in accordance with applicable maintenance manual and connected to appropriate test equipment |
| | 2.2 Built-in system test functions and status displays are activated, where applicable, outputs recorded and interpreted |
| | 2.3 Assistance is provided with engine and/or system operation during prescribed test procedures to establish serviceability and correct function in accordance with applicable maintenance manual |
| 3. Prepare for troubleshooting | 3.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify an unserviceability |
| 4. Troubleshoot piston engine system | 4.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | 4.2 Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 4.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 4.4 Piston engine system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required |
| | 4.5 Fault rectification requirements are determined to assist in planning the repair |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Piston engines and engine systems include:

- Engine (all types), main components and accessories/drives
- Control system, including full authority digital engine control (FADEC) (where FADEC is applicable to the enterprise)
- Ignition and starter systems
- Fuel, air systems and super/turbo chargers
- Oil system
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Unit Mapping Information

Release 1 – equivalent to MEA313C Inspect, test and troubleshoot piston engine systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA313 Inspect, test and troubleshoot piston engine systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the use of MSDS and PPE
- using relevant maintenance documentation and aircraft manuals
- through visual/physical inspection, recognising external and internal signs of defects in piston engines, components and system components
- assisting with testing of piston engine and engine system operation, be able to operate systems, monitor indications, record parameters and recognise correct function
- compiling engine condition monitoring records
- rigging and adjusting engine controls and systems, including FADEC (where FADEC is applicable to the enterprise)
- using fault diagnosis guides and equivalent data to accurately and efficiently troubleshoot the causes of unserviceabilities in piston engines and engine systems, clearly record details and identify the required rectification actions.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisor or other trades) associated with engine systems. It is essential that system testing procedures take into account all safety precautions associated with piston engine system operation, and that awareness be demonstrated of dual inspection requirements associated with work on engine controls. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This may be demonstrated through application across a number of engine system groups as listed in the Assessment Conditions. The application of testing procedures and functional rigging checks should also indicate knowledge of system operation.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS procedures associated with piston engine maintenance, including lifting and handling of heavy objects
- how to obtain MSDS

- use of PPE
- fault diagnosis techniques
- piston engine and engine system layout and operation:
 - four stroke engine theory of operation and performance
 - cylinder configurations
 - construction – components and materials
 - carburettors and air induction systems
 - fuel injection systems
 - fuels and their characteristics
 - ignition systems
 - lubricating systems and lubricants
 - cooling systems
 - exhaust systems
 - superchargers and turbochargers
 - accessory drives and mounts
 - controls and rigging of controls
 - FADEC systems
 - piston engine maintenance requirements and troubleshooting procedures including ground running of engines
- system component operation, including electrical and instrument system interfaces:
 - magnetos and ignition harnesses
 - spark plugs
 - fuel pumps
 - fuel filters
 - oil pumps
 - oil filters
 - oil tanks
 - vacuum pumps and air pumps
 - generators
 - starter motors
 - oil pressure gauges (direct reading)
 - temperature gauges (direct reading)
 - tachometers
 - manifold pressure gauges
 - system and component maintenance requirements and troubleshooting procedures
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- Engine system operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to carry out rigging checks and troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- Testing of engines fitted to helicopters (where auxiliary drive is not available) may be carried out through the applicant directing a pilot qualified on type.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - engine (all types), main components and accessories/drives
 - control system, including FADEC (where FADEC is applicable to the enterprise)
 - ignition and starter systems
 - fuel, air systems and super/turbo chargers
 - oil system.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA353 Maintain basic light aircraft engines and propellers will have satisfied the requirements of this unit with regard to common Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA353 Maintain basic light aircraft engines and propellers may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

Assessment Requirements for MEA314 Inspect, test and troubleshoot gas turbine engine systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including lifting and handling of heavy components
- using MSDS and PPE
- using relevant maintenance documentation and aircraft manuals to:
 - through visual/physical inspection, recognise external and internal signs of defects in gas turbine engines, components and system components
 - assist with testing of gas turbine engine and engine system operation, be able to operate systems, monitor indications, record parameters and recognise correct function
 - compile engine condition monitoring records
 - rig and adjust engine controls and systems
- using fault diagnosis guides and equivalent data, accurately and efficiently to troubleshoot the causes of unserviceabilities in gas turbine engines and engine systems, clearly record details and identify the required rectification actions.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisor or other trades) associated with engine systems. It is essential that system test procedures take into account all safety precautions associated with gas turbine engine system operation, especially with regard to high energy ignition units, and that awareness be demonstrated of dual inspection requirements associated with work on engine control systems.

This shall be demonstrated through application across a number of engine system groups as listed in the Assessment Conditions. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical. The application of testing procedures and functional rigging checks should also indicate knowledge of system operation.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- fault diagnosis techniques

- gas turbine engine layout and operation:
 - types of gas turbine
 - operating principles and power output
 - gas path
 - intakes
 - compressors
 - combustion chambers
 - turbines
 - exhaust
 - thrust reversers
 - accessory drives
 - bearings and seals
 - maintenance requirements and troubleshooting procedures
- system and component operation, including electrical and instrument system interfaces:
 - fuel control and fuels
 - lubrication and lubricants
 - air distribution
 - starting
 - ignition
 - power augmentation
 - instrumentation:
 - performance indication
 - condition indication
 - warning
 - presentation and interpretation of electronic displays
 - fire warning and extinguishing
 - control system and rigging of engine controls
- engine spin/run procedures, including the operation of auxiliary power units (APUs)
- engine condition monitoring
- relevant WHS practices including the requirements for the lifting and handling of heavy components
- how to obtain MSDS
- selection and use of PPE
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- Engine system operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to carry out rigging checks and troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- Testing of engines fitted to helicopters (where auxiliary drive is not available) may be carried out through the applicant directing a pilot qualified on type.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - engine change unit, main components and accessories/drives
 - control system
 - ignition and starter systems
 - fuel system
 - oil system
 - air system.
- This shall be established via the records in the Log of Industrial Experience and Achievement, or where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

Assessment Requirements for MEA315 Inspect, test and troubleshoot propeller systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the lifting and handling of heavy components
- using relevant maintenance documentation and aircraft manuals to:
 - recognise, through visual/physical inspection, external signs of defects or rigging abnormalities in propellers and propeller system components
 - functionally test propellers and propeller systems and recognise any indication of malfunction or incorrect rigging or adjustment
 - rig and adjust propeller controls and systems
- using fault diagnosis guides and equivalent data to accurately and efficiently troubleshoot the causes of unserviceabilities in propellers and propeller systems, clearly record details and identify the required rectification actions.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with propeller systems. It is essential that system test procedures take into account all safety precautions associated with propeller system operation, and that awareness be demonstrated of dual inspection requirements associated with work on propeller control systems.

This shall be demonstrated through application across a number of propeller systems or propeller types. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- fault diagnosis techniques
- propeller system layout and operation:
 - propeller types
 - propeller terminology
 - forces acting on a propeller

- propeller construction
- propeller operation
- pitch changing mechanisms
- governors and beta control
- controls and rigging of propeller controls
- maintenance requirements and troubleshooting procedures
- ancillary systems and system component operation, including electrical and instrument system interfaces:
 - de-icing and anti-icing
 - multi-engine synchronising and synchrophasing
 - feathering and unfeathering, including auto feathering
 - pitch reversal
 - negative torque sensing and protection
 - de-coupling
 - braking
 - thrust and torque measuring and indication
 - maintenance requirements and troubleshooting procedures
- relevant WHS practices, including the requirements for the lifting and handling of heavy components
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance manuals. It is also expected that general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation. System operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - propellers, including spinners, where fitted
 - constant speed, feathering and reversing propeller drives
 - beta control systems and governors

- controls and linkages
- de-ice/anti-ice equipment (may be omitted where it is not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA316 Inspect, test and troubleshoot rotary wing rotor and control systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, the use of maintenance publications, and knowledge of rotors and rotor control system theory to inspect, test and troubleshoot rotary wing aircraft rotors and rotor control systems during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

Assessment Requirements for MEA316 Inspect, test and troubleshoot rotary wing rotor and control systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures
- using relevant maintenance documentation and aircraft manuals to:
 - recognise through visual/physical inspection external signs of defects in the rotor, rotor head, tail rotor and flight control mechanical system components
 - ground test the rotor and control system and recognise correct function
 - rig and adjust rotor controls and systems
- using fault diagnosis guides and equivalent data to accurately and efficiently troubleshoot the causes of unserviceabilities in rotor control systems, clearly record details and identify the required rectification actions.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with the rotor control systems. It is essential that testing procedures take into account all safety precautions associated with ground testing of rotor and rotor control systems, and that awareness be demonstrated of dual inspection requirements associated with work on control systems.

Ability to interpret system performance specifications (allowable limits) and apply them in practice is critical and shall be demonstrated through application across the range of systems listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- fault diagnosis techniques
- standard trade practices relating to tool and test/rigging equipment usage
- theory of flight:
 - airflow
 - conditions of flight

- lift and forces
- drag
- rotary flight principles:
 - terminology relating to:
 - aerofoils
 - main rotor blades
 - rotor discs
 - rotors – main and tail
 - aerodynamic characteristics:
 - aerofoil design
 - forces
 - rotor thrust and power requirements
 - vortex ring
 - autorotation
 - helicopter stability
- helicopter dynamic components:
 - main rotors:
 - blades
 - heads
 - linkages
 - tail rotors
 - swash plates
 - transmissions and drive shafts
 - clutches and freewheeling units
- system and component operation, including electrical and instrument system interfaces:
 - cyclic pitch control
 - collective pitch control
 - tail rotor control
 - mechanical and powered control systems
 - engine control interface
 - torque reaction and anti-torque devices
 - engine indication
 - vibration monitoring
- helicopter maintenance procedures and troubleshooting
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures including requirements for engine and rotor system operation
- relevant WHS practices.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- The application of ground testing procedures should clearly indicate knowledge of system operation. System operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- Functional testing of rotors and rotor control systems with engine/s running may be carried out with the applicant directing a pilot qualified on type.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - main rotor blades and tail rotor blades
 - rotor heads, swash plates and tail rotor pitch control assemblies
 - mechanical, powered flight control components
 - main rotor, intermediate or tail rotor gearboxes
 - drive shafts and couplings.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA352 Maintain basic rotary wing aircraft systems will have satisfied the requirements of this unit with regard to common Range of Conditions variables. The Log of Industrial Experience and Achievement records relating to MEA352 Maintain basic rotary wing aircraft systems may be accepted as also meeting the evidence requirements for this unit in the applicable common areas.

MEA317 Remove and install pressurised aircraft structural and non-structural components

Modification History

Release 2 – MEA369 Inspect and maintain structure and related components of non-pressurised small aircraft included as an optional pre-requisite.

Application

This unit of competency requires application of hand skills and maintenance publications to remove and install structural and non-structural components from fixed wing aircraft with pressurised cabins during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway and may also be part of a Structures Maintenance Certificate IV training pathway

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA369 Inspect and maintain structure and related components of non-pressurised small aircraft

OR

MEA302 Remove and install aircraft hydro-mechanical and landing gear system components

AND

MEA303 Remove and install aircraft pneumatic system components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-----------------------|--|
| 1. Remove components | 1.1 Structure is supported and prepared in accordance with the applicable maintenance manual to ensure personnel safety and freedom from damage to aircraft or component during component removal |
| | 1.2 Component removal is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| | 1.4 Removed components are tagged and prepared for transport in accordance with specified procedures |
| 2. Install components | 2.1 Structural components to be installed are checked to confirm correct part numbers, serviceability and modification status |
| | 2.2 Component installation is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 2.3 Support/safety equipment is removed at an appropriate time to ensure personnel safety and freedom from structural damage |
| | 2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Removable components of structure include:

- Those that are installed using bolts and/or screws. Where component removal and installation requires the removal and installation of rivets the applicable unit is either MEA339 Inspect, repair and maintain aircraft structures, MEA370 Repair the structure of non-pressurised small aircraft or MEA371 Perform major repairs and modifications to small aircraft metal structure.
- Structural components include:
 - removable components of wings, pylons, empennage, landing gear support structure, fairings, nacelles and thrust reversers
 - removable components or sections of pressurised aircraft fuselage
 - pressurised fuselage entry, cargo, access doors and associated pressure seals
 - pressurised fuselage windows, transparent panels and associated seals
 - trim panels, linings, seats, cabin equipment and consoles, floor panels and coverings (where applicable to the enterprise)
 - applicable emergency and safety equipment, including passenger escape systems, inflatable, slides, life jackets, rafts, location transmitters, beacons, and crew and/or passenger seat restraints

Installation includes:

- Checking and adjustment of all doors and access panels, including locking mechanisms, for correct fit and sealing

Sealant removal and application includes:

- The removal and application of faying (contact or overlapping) surface, pressure hull and fuel tank sealants (where applicable to the enterprise)

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 2 – MEA369 Inspect and maintain structure and related components of non-pressurised small aircraft included as an optional pre-requisite. Equivalent.

Release 1 – equivalent to MEA317C Remove and install pressurised aircraft structural and non-structural components

Assessment Requirements for MEA317 Remove and install pressurised aircraft structural and non-structural components

Modification History

Release 2 – MEA369 Inspect and maintain structure and related components of non-pressurised small aircraft included as an optional pre-requisite.

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation and aircraft manuals to:
 - remove structural components
 - install structural components
 - remove doors, door seals, windows and transparent panels
 - install doors, door seals, windows and transparent panels
- checking and adjusting all doors and access panels, including locking mechanisms and ensuring effective sealing.

The underlying skills inherent in this unit should be transferable to other units that require similar techniques. It is essential that shoring, trestling and lifting requirements and safety precautions applicable to the structure being maintained are fully observed, understood and complied with.

This may be demonstrated through application across a representative range of the component groups listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- structural component methods of construction and attachment
- faying surface treatment and fuel tank and pressure hull sealing
- aircraft doors and related seals
- window and transparent panel construction, attachment methods and sealing
- aircraft interior fittings (trim, linings, seats, floor panels, and so on) construction and attachment methods
- the location and attachment or stowage methods for emergency equipment:
 - passenger escape systems

- inflatable slides
- life jackets
- life rafts
- location transmitters, beacons
- crew and/or passenger seat restraints
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures
- relevant WHS practices
- how to obtain MSDS
- use of PPE.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of component handling, attachment methods, adjustment and sealing as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - removable components of wings, pylons, empennage, landing gear support structure, fairings, nacelles and thrust reversers
 - removable components or sections of pressurised aircraft fuselage
 - pressurised fuselage entry, cargo, access doors and associated pressure seals
 - pressurised fuselage windows, transparent panels and associated seals
 - trim panels, linings, seats, cabin equipment and consoles, floor panels, coverings (items may be omitted where not applicable to the enterprise)
 - applicable emergency and safety equipment, including passenger escape systems, inflatable, slides, life jackets, rafts, location transmitters, beacons, and crew and/or passenger seat restraints.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA318 Inspect aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, standard trade practices and systems knowledge in the inspection of aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components of fixed wing aircraft during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Aircraft Maintenance Engineer (AME) Certificate IV training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA302	Remove and install aircraft hydro-mechanical system and landing gear components
MEA303	Remove and install aircraft pneumatic system components
MEA305	Remove and install aircraft fixed wing flight control system components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Inspect hydro-mechanical systems and components | 1.1 Isolation tags already attached to the system or related systems are checked and aircraft configured for safe system inspection and operation in accordance with specified procedures |
| | 1.2 Hydro-mechanical system and system components are visually or physically checked for external signs of defects in accordance with specified procedures while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| 2. Inspect landing gear systems and components | 2.1 Isolation tags already attached to the system or related systems are checked and aircraft configured, including jacking, where necessary, for safe system inspection and operation in accordance with specified procedures |
| | 2.2 Landing gear system and system components are visually or physically checked for external signs of defects in accordance with specified procedures while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| 3. Inspect gaseous systems and components | 3.1 Isolation tags already attached to the system or related systems are checked and aircraft configured for safe system inspection and operation in accordance with specified procedures |
| | 3.2 Gaseous system and system components are visually or physically checked for external signs of defects in accordance with specified procedures while observing all relevant WHS requirements |
| 4. Inspect mechanical systems and components | 4.1 Isolation tags already attached to the system or related systems are checked and aircraft configured for safe system inspection and operation in accordance with specified procedures |
| | 4.2 Mechanical system and system components are visually or physically checked for external signs of defects in accordance with specified procedures while observing |

all relevant WHS requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Hydro-mechanical systems include:

- Hydraulic systems
- Fuel systems
-

Components of hydro-mechanical systems include:

- Hydraulic accumulators, filters, reservoirs, valves, pumps, motors, actuators, regulators and direct reading gauges
- Fuel system filters, valves, pumps, and rigid and flexible storage cells/tanks
- Rigid and flexible pipelines, hoses and fittings

Landing gear systems include:

- Retraction systems
- Steering systems
- Brake systems, including anti-skid, where applicable

(components of landing gear retraction, steering and braking systems are covered by hydro-mechanical and mechanical system components)

Landing gear components include:

- Wheel assemblies
- Brake units
- Struts/oleos

Gaseous systems include:

- Pneumatic
- Air cycle air conditioning
- Pressurisation
- Fire-extinguishing

Gaseous system components include:

- Gauges (direct reading), temperature sensors, pressurisation controllers and temperature controllers
- Heat exchangers, pressure vessels, condensers,

- compressors, expansion turbines, humidifiers, valves and actuators
- Rigid and flexible pipelines and fittings
 - Ducting
- Mechanical systems include:**
- Mechanical operating and locking systems
 - Mechanical flight control systems or the mechanical elements of power-assisted flight control systems
- Mechanical system components include:**
- Cables, pulleys, guides, fairleads, tension regulators, chains and sprockets
 - Control rods, torque tubes, bellcranks, screwjacks, clutches, springs, bearings and gears
 - Control sticks, wheels, columns, trim wheels or handles, and rudder pedals
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA318 Inspect aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying all relevant WHS practices, including the use of MSDS and PPE
- using maintenance manuals and documentation to prepare the aircraft and identify requirements for inspection of hydraulic, fuel, gaseous, flight control, landing gear and mechanical systems and components
- using hand skills and tools in the inspection of hydraulic, fuel, flight control, gaseous and mechanical system components
- jacking of the aircraft, as required, for landing gear system inspection
- using hand skills and tools in the inspection of landing gear components
- recognising external defects in hydraulic, fuel, gaseous, flight control, landing gear and mechanical systems and components.

The underlying skills inherent in this unit should be transferable across a range of inspection applications (including the timely involvement of supervisors or other trades) associated with aircraft hydro-mechanical, gaseous, mechanical and landing gear systems and their components. It is essential that system/component inspection procedures take into account all safety precautions applicable to the system being maintained, especially where system operation/switching interrelates to other systems being maintained. Ability to interpret system performance specifications (allowable limits) and apply them in practice is critical and shall be demonstrated through application across the range of systems listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- how to recognise external defects in hydraulic, fuel, gaseous, flight control, landing gear and mechanical system components
- how to configure the aircraft for inspection of hydraulic, fuel, gaseous, flight control, landing gear and mechanical systems and components
- inspection and testing requirements for gears, springs and bearings

- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- maintenance requirements
- relevant WHS practices relating to hydraulic, fuel, gaseous, flight control, landing gear and mechanical system components, including lifting and handling of heavy items
- how to obtain MSDS
- selection and use of PPE
- maintenance requirements
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using procedures, tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on each type of system and on at least one (1) component of each group listed in the Range of Conditions, as follows:
 - hydraulic systems – a system and at least one (1) component from each of the following groups:
 - hydraulic accumulators, filters, reservoirs, valves, pumps, motors, actuators, regulators and direct reading gauges
 - rigid and flexible pipelines, hoses and fittings
 - fuel systems – a system and at least one (1) component from each of the following groups:
 - fuel system filters, valves, pumps, and rigid and flexible storage cells/tanks
 - rigid and flexible pipelines, hoses and fittings
 - landing gear systems – each system:
 - retraction systems
 - steering systems
 - brake systems, including anti-skid, where applicable
 - landing gear components – one (1) each of:
 - wheel assemblies
 - brake units
 - struts/oleos
 - gaseous systems – each listed system:

- pneumatic
- air cycle air conditioning
- pressurisation
- fire-extinguishing
- gaseous system components - at least one (1) component from each of the following groups:
 - gauges (direct reading), temperature sensors, pressurisation controllers and temperature controllers
 - heat exchangers, pressure vessels, condensers, compressors, expansion turbines, humidifiers, valves and actuators
 - rigid and flexible pipelines and fittings
 - ducting
- mechanical systems – a system applicable to each of system types:
 - mechanical operating and locking systems
 - mechanical flight control systems or the mechanical elements of power-assisted flight control systems
- mechanical system components - at least one (1) component from each of the following groups:
 - cables, pulleys, guides, fairleads, tension regulators, chains and sprockets
 - control rods, torque tubes, bellcranks, screwjacks, clutches, springs, bearings and gears
 - control sticks, wheels, columns, trim wheels or handles, and rudder pedals.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained the following related units will have met the Performance Criteria and Range of Conditions variables for Elements listed:
 - MEA309 Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components, for Element 1
 - MEA309 Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear systems and components, for Element 2, provided that the unit was attained on aircraft with retractable landing gear
 - MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components, for Element 3
 - MEA312 Inspect, test and troubleshoot aircraft fixed wing flight control systems and components, for Element 4.

- The Log of Industrial Experience and Achievement records relating to the listed units may be accepted as also meeting the evidence requirements for this unit in the applicable Elements. Advice in MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components regarding MEA355 Maintain light aircraft air cycle air conditioning systems, and MEA356 Maintain light piston engine aircraft pressurisation systems, may also be taken into consideration where applicable.

MEA319 Inspect gas turbine engine systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, the use of maintenance publications, and knowledge of gas turbine engine and system theory to inspect gas turbine engines and engine system components of fixed and rotary wing aircraft.

The unit is part of the Mechanical Aircraft Maintenance Engineer (AME) Certificate IV training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA306 Remove and install engine system and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---------------------------|---|
| 1. Inspect gas turbine | 1.1 Isolation tags already attached to the system or related |
|---------------------------|---|

engine systems and components

systems are checked and aircraft configured for safe system inspection and operation in accordance with applicable maintenance manual

- 1.2 Gas turbine engine and/or components are visually or physically checked for external signs of defects in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Gas turbine engine and components include:

- Engine change unit, main components and accessories/drives
- Control system and major system components
- Ignition and starter systems and major system components
- Engine fuel system and major system components
- Oil system and major system components
- Air system and major system components
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Procedures and requirements include:

Assessment Requirements for MEA319 Inspect gas turbine engine systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including lifting and handling of heavy components
- using MSDS and PPE
- using relevant maintenance documentation and aircraft manuals to:
 - recognise through visual/physical inspection external and internal signs of defects/damage to gas turbine engine, components and system components
 - assist with testing of gas turbine engine and engine system operation.

The underlying skills inherent in this unit should be transferable across a range of inspection applications (including the timely involvement of supervisors or other trades) associated with gas turbine engines, components and systems. It is essential that inspection procedures take into account all safety precautions applicable to the system/component being maintained. Ability to interpret system performance specifications (allowable limits) and apply them in practice is critical and shall be demonstrated through application across the range of systems listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- gas turbine engine layout and operation:
 - intakes
 - compressors
 - combustion chambers
 - turbines
 - exhaust
 - thrust reversers
 - accessory drives
 - bearings and seals
 - maintenance requirements
- system and component operation, including electrical and instrument system interfaces:

- fuel control and fuels
- lubrication and lubricants
- air distribution
- starting
- ignition
- power augmentation
- instrumentation:
 - performance indication
 - condition indication
 - warning
 - presentation and interpretation of electronic displays
- fire warning and extinguishing
- control system
- engine spin/run procedures, including the operation of auxiliary power units (APUs)
- engine condition monitoring
- relevant WHS practices, including the requirements for the lifting and handling of heavy components
- how to obtain MSDS
- selection and use of PPE
- maintenance requirements
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations and used to assist in the inspection process would be used where appropriate.
- The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on each of the following systems and at least one (1) component of each system.
 - engine change unit, main components and accessories/drives
 - control system and major system components
 - ignition and starter systems and major system components
 - engine fuel system and major system components
 - oil system and major system components
 - air system and major system components.

- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA314 Inspect, test and troubleshoot gas turbine engine systems and components, will have fully met the criteria for this unit. Log of Industrial Experience and Achievement records relating to MEA314 Inspect, test and troubleshoot gas turbine engine systems and components may be accepted as also meeting the evidence requirements for this unit.

MEA320 Test and troubleshoot aircraft hydro-mechanical, gaseous and landing gear systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, standard trade practices, and systems knowledge in the testing and troubleshooting of aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components of fixed wing aircraft during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Aircraft Maintenance Engineer (AME) Certificate IV (Aircraft Maintenance Stream) training pathways and must be taken with MEA318 Inspect aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA318 Inspect aircraft hydro-mechanical, mechanical, gaseous and landing gear systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Prepare for troubleshooting | 1.1 Relevant maintenance documentation and modification status, including system defect/service difficulty reports, where relevant, are interpreted to identify an unserviceability |
| 2. Test hydro-mechanical, mechanical, gaseous and landing gear systems and components | 2.1 The aircraft and hydro-mechanical, mechanical, gaseous and landing gear systems are correctly prepared in accordance with specified procedures for the application of power

2.2 Power is applied and system and components functionally tested in accordance with specified procedures for evidence of malfunction or leaks while applying all relevant work health and safety (WHS) procedures

2.3 System calibration or adjustments are performed in accordance with specified procedures |
| 3. Troubleshoot hydro-mechanical, mechanical, gaseous and landing gear systems and components | 3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination

3.2 Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level

3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process

3.4 Hydro-mechanical, mechanical, gaseous and landing gear system and component faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required

3.5 Fault rectification requirements are determined to assist in planning the repair or adjustment |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Hydro-mechanical systems include:

- Hydraulic systems
- Fuel systems

Components of hydro-mechanical systems include:

- Hydraulic accumulators, filters, reservoirs, valves, pumps, motors, actuators, regulators and direct reading gauges
- Fuel system filters, valves, pumps, rigid and flexible storage cells/tanks
- Rigid and flexible pipelines, hoses and fittings

Landing gear systems include:

- Retraction systems
- Steering systems
- Brake systems, including anti-skid, where applicable

(components of landing gear retraction, steering and braking systems are covered by hydro-mechanical and mechanical system components)

Landing gear components include:

- Wheel assemblies
- Brake units
- Struts/oleos

Gaseous systems include:

- Pneumatic
- Air cycle air conditioning
- Pressurisation
- Fire-extinguishing

Gaseous system components include:

- Gauges (direct reading), temperature sensors, pressurisation controllers and temperature controllers
- Heat exchangers, pressure vessels, condensers, compressors, expansion turbines, humidifiers, valves and actuators
- Rigid and flexible pipelines and fittings
- Ducting

- Mechanical systems include:**
- Mechanical operating and locking systems
- Mechanical system components include:**
- Cables, pulleys, guides, fairleads, tension regulators, chains and sprockets
 - Push/pull rods, torque tubes, bellcranks, screwjacks, clutches, springs, bearings and gears
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA320C Test and troubleshoot aircraft hydro-mechanical, gaseous and landing gear systems and components

Assessment Requirements for MEA320 Test and troubleshoot aircraft hydro-mechanical, gaseous and landing gear systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying all relevant WHS procedures
- using maintenance manuals to prepare the aircraft for testing and troubleshooting of hydraulic, fuel, gaseous, landing gear and mechanical systems and components
- using hand skills, tools and systems knowledge in the testing, adjustment and troubleshooting of hydraulic, fuel, gaseous, mechanical and landing gear systems
- using hand skills, tools and component knowledge in the adjustment and troubleshooting of hydraulic, fuel, gaseous and mechanical system components
- jacking of the aircraft, as required, for landing gear system testing, rigging and troubleshooting
- using hand skills, tools and system/component knowledge in the adjustment and troubleshooting of landing gear components
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process
- recognising external defects in hydro-mechanical, gaseous, mechanical and landing gear systems and components.

The underlying skills inherent in this unit should be transferable across a range of testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with aircraft hydro-mechanical, gaseous, mechanical and landing gear systems and their components. It is essential that system test procedures take into account all safety precautions applicable to the system being maintained, especially where system operation/switching interrelates to other systems being maintained.

Ability to interpret system performance specifications (allowable limits) and apply them in practice is critical and shall be demonstrated through application across the range of systems listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- hydraulic, fuel, gaseous, mechanical and landing gear system layout, operation and characteristics and system component operation and construction, including electrical system interfaces
- how to configure the aircraft for testing and troubleshooting of hydraulic, fuel, gaseous, mechanical and landing gear systems and components
- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- fluid power theory
- hydraulic system layout, operation and characteristics (including electrical and instrument system interfaces) and system component construction and operation for:
 - landing gear retraction systems
 - brake and anti-skid systems
 - nose wheel steering systems
- fuel system and component layout, operation and characteristics (including electrical system interfaces) and system component operation and construction
- gaseous (pneumatic, air conditioning, pressurisation and fire-extinguishing system and component layout, operation and characteristics (including electrical and instrument interfaces) and system component operation and construction
- construction and operation of landing gear components, including:
 - wheel assemblies
 - struts/oleos
 - uplocks and downlocks
- mechanical systems and linkages, including those related to the above systems
- how to configure the aircraft for inspection, testing and troubleshooting of hydraulic, fuel, gaseous and landing gear systems and components
- maintenance requirements and troubleshooting procedures
- relevant WHS practices relating to hydraulic, fuel, gaseous, mechanical and landing gear systems and components, including lifting and handling of heavy items
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using procedures, tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the approved aerospace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on each type of system and on at least one (1) component of each group, as follows:
 - hydraulic systems – a system and at least one (1) component from each of the following hydro-mechanical system component groups:
 - hydraulic accumulators, filters, reservoirs, valves, pumps, motors, actuators, regulators and direct reading gauges
 - rigid and flexible pipelines, hoses and fittings
 - fuel systems – a system and at least one (1) component from each of the following fuel system component groups:
 - fuel system filters, valves, pumps, rigid and flexible storage cells/tanks
 - rigid and flexible pipelines, hoses and fittings
 - landing gear systems – each of the following systems:
 - retraction systems
 - steering systems
 - brake systems, including anti-skid, where applicable
 - landing gear components – one (1) each of:
 - wheel assemblies
 - brake units
 - struts/oleos
 - gaseous systems – each of the following systems:
 - pneumatic
 - air cycle air conditioning
 - pressurisation
 - fire-extinguishing
 - gaseous system components - at least one (1) component from each of the following gaseous system component groups:
 - gauges (direct reading), temperature sensors, pressurisation controllers and temperature controllers
 - heat exchangers, pressure vessels, condensers, compressors, expansion turbines, humidifiers, valves and actuators
 - rigid and flexible pipelines and fittings
 - ducting
 - mechanical systems – a mechanical operating and locking system and at least one (1) component from each of the following mechanical system component groups:
 - cables, pulleys, guides, fairleads, tension regulators, chains and sprockets
 - push/pull rods, torque tubes, bellcranks, screwjacks, clutches, springs, bearings and gears.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).

- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained the following related units will have met the Performance Criteria and Range of Conditions variables for Elements listed:
 - Element 1 – any one of MEA309 Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear system and components, or MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components
 - Elements 2 and 3 – MEA309 Inspect, test and troubleshoot aircraft hydro-mechanical and landing gear system and components, for hydro-mechanical system variables, and MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components, for gaseous system variables.
- The Log of Industrial Experience and Achievement records relating to the listed units may be accepted as also meeting the evidence requirements for this unit in the applicable Elements for systems and components as listed in the Range of Conditions variables. Advice in MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components, regarding MEA355 Maintain light aircraft air cycle air conditioning systems, and MEA356 Maintain light piston engine aircraft pressurisation systems, may also be taken into consideration where applicable.

MEA321 Test and troubleshoot aircraft fixed wing flight control systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance publications and knowledge of system theory to test and troubleshoot aircraft flight control systems and components of fixed wing aircraft during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Aircraft Maintenance Engineer (AME) Certificate IV training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA318 Inspect aircraft hydro-mechanical, mechanical gaseous and landing gear systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the Performance criteria describe the performance needed to

essential outcomes.	demonstrate achievement of the element.
1. Prepare for troubleshooting	1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are interpreted to identify an unserviceability
2. Test fixed wing flight control systems	2.1 Powered controls of the aircraft and system are prepared in accordance with maintenance manual for the application of electrical and hydraulic power
	2.2 Power is applied, if necessary, and system is functionally tested in accordance with applicable maintenance manual for malfunction or evidence of incorrect rigging while observing all relevant work health and safety (WHS) requirements
	2.3 System rigging is performed in accordance with applicable maintenance manual
3. Troubleshoot fixed wing flight control systems	3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination
	3.2 Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level
	3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
	3.4 Fixed wing flight control system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Fixed wing flight control systems and components include:

- Ailerons, elevators, rudders, trim tabs, speed brakes, spoilers, flaps and slats
- Actuators – mechanical, hydraulic, pneumatic or electric
- Mechanical flight control components, including cables, pulleys, guides, fairleads, tension regulators, control rods, bellcranks, torque tubes, chains, sprockets, control sticks (or wheels or columns), trim wheels or handles, and rudder pedals

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA321C Test and troubleshoot aircraft fixed wing flight control systems and components

Assessment Requirements for MEA321 Test and troubleshoot aircraft fixed wing flight control systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying all relevant WHS procedures
- using relevant maintenance documentation and aircraft manuals to:
 - recognise defects during visual inspection of fixed wing flight control systems and system components
 - rig fixed wing flight control systems
 - functionally test the operation of fixed wing flight control systems and recognise system/component malfunction or evidence of incorrect rigging
 - to the extent permitted by applicable fault diagnosis guides, troubleshooting unserviceabilities in fixed wing flight control systems and clearly record the causes of the unserviceabilities.

The underlying skills inherent in this unit should be transferable across a range of testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with the aircraft fixed wing flight systems. It is essential that testing procedures take into account all safety precautions associated with flight control system operation, in particular where system operation/switching interrelates with other systems being maintained, and that knowledge be demonstrated of dual inspection requirements associated with work on flight controls and systems.

This shall be demonstrated through application across the system/component groups listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS precautions relevant to flight control system maintenance
- standard trade practices relating to tool and test/rigging equipment usage and installation/securing of system components
- flight control system layout and operation:
- theory of flight:
 - airflow

- conditions of flight
- lift and forces
- drag
- wings, tailplane and vertical stabiliser
- lift augmentation (flaps, slats and slots)
- aircraft control surfaces and their function (elevator, ailerons, rudder, elevons and trim tabs)
- spoilers and speed brakes
- flight control balancing and flutter
- stability and control and flight control rigging
- mechanical system layout and operation:
 - cockpit controls
 - cables and cable tensioning
 - pulleys and fairleads
 - bellcranks
 - levers
 - control surface horns
 - screwjacks
 - push/pull rods
- powered flight controls:
 - system layout and operation
 - component construction and operation
 - electrical and instrument interfaces:
 - flaps
 - trim
 - position indication
- flight control system maintenance procedures and troubleshooting methods
- flight control system rigging equipment and procedures
- flight control system interfaces with automatic pilot systems and automatic flight control systems
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate. The level of troubleshooting is limited in its application to the use of fault diagnosis guides or other similar information.

- The application of ground testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - ailerons, elevators, rudders, trim tabs, speed brakes, spoilers, flaps and slats
 - actuators – mechanical, hydraulic, pneumatic or electric
 - mechanical flight control components including cables, pulleys, guides, fairleads, tension regulators, control rods, bellcranks, torque tubes, chains, sprockets, control sticks (or wheels or columns), trim wheels or handles, and rudder pedals.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA312 Inspect, test and troubleshoot aircraft fixed wing flight control systems and components, will have met the requirements for the Performance Criteria for Element 1. The requirements for Elements 2 and 3 will also be met if recorded experience for MEA312 Inspect, test and troubleshoot aircraft fixed wing flight control systems and components involved aircraft with powered flight controls. If experience was gained on aircraft types with only mechanical flight controls the recorded experience will partially meet the requirements for this unit. The Log of Industrial Experience and Achievement records relating to MEA312 Inspect, test and troubleshoot aircraft fixed wing flight control systems and components may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

MEA322 Test and troubleshoot gas turbine engine systems and components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, the use of maintenance publications, and knowledge of gas turbine engine and system theory to test and troubleshoot gas turbine engines and engine system components of fixed and rotary wing aircraft during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Aircraft Maintenance Engineer (AME) Certificate IV training pathways and must be taken with MEA319 Inspect gas turbine engine systems and components.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA319 Inspect gas turbine engine systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Prepare for troubleshooting | 1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are interpreted to identify an unserviceability |
| 2. Test gas turbine engine system | 2.1 Aircraft and gas turbine engine system are correctly prepared in accordance with applicable maintenance manual and connected to appropriate test equipment while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)

2.2 Built-in system test functions and status displays are activated, where applicable, outputs recorded and interpreted

2.3 Assistance is provided with gas turbine engine and/or system operation during prescribed test procedures to establish serviceability and correct function in accordance with applicable maintenance manual |
| 3. Troubleshoot gas turbine engine system | 3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination

3.2 Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level

3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process

3.4 Gas turbine engine system faults are located and causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required

3.5 Fault rectification requirements are determined to assist in planning the repair or adjustment |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Gas turbine engine systems include:

- Engine change unit, main components and accessories/drives
 - Control system
 - Ignition and starter systems
 - Fuel system
 - Oil system
 - Air system
- Procedures and requirements include:
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA322C Test and troubleshoot gas turbine engine systems and components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA322 Test and troubleshoot gas turbine engine systems and components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including lifting and handling of heavy components
- using MSDS and PPE
- using relevant maintenance documentation and aircraft manuals to:
 - recognise through visual/physical inspection external and internal signs of defects in gas turbine engines, components and system components
 - assist with testing of gas turbine engine and engine system operation, be able to operate systems, monitor indications, record parameters and recognise correct function
 - compile engine condition monitoring records
 - rig and adjust engine controls and systems
- using fault diagnosis guides and equivalent data, to accurately and efficiently troubleshoot the causes of unserviceabilities in gas turbine engines and engine systems, clearly record details and identify the required rectification actions.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisor or other trades) associated with engine systems. It is essential that system test procedures take into account all safety precautions associated with gas turbine engine system operation, especially with regard to high-energy ignition units, and that awareness be demonstrated of dual inspection requirements associated with work on engine control systems.

This shall be demonstrated through application across the engine systems listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- fault diagnosis techniques
- gas turbine engine layout and operation:
 - types of gas turbine
 - operating principles and power output

- gas path
- intakes
- compressors
- combustion chambers
- turbines
- exhaust
- thrust reversers
- accessory drives
- bearings and seals
- maintenance requirements and troubleshooting procedures
- system and component operation, including electrical and instrument system interfaces:
 - fuel control and fuels
 - lubrication and lubricants
 - air distribution
 - starting
 - ignition
 - power augmentation
 - instrumentation:
 - performance indication
 - condition indication
 - warning
 - presentation and interpretation of electronic displays
 - fire warning and extinguishing
 - control system and rigging of engine controls
- engine spin/run procedures including the operation of auxiliary power units (APUs)
- engine condition monitoring
- relevant WHS practices, including the requirements for the lifting and handling of heavy components
- how to obtain MSDS
- selection and use of PPE
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in aircraft maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate. The level of troubleshooting is limited in its application to the use of fault diagnosis guides or other similar information.

- The application of testing procedures and functional rigging checks should also indicate knowledge of system operation. Engine system operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to carry out rigging checks and troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - engine change unit, main components and accessories/drives
 - control system
 - ignition and starter systems
 - fuel system
 - oil system
 - air system
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA314 Inspect, test and troubleshoot gas turbine engine systems and components, will have fully met the criteria for this unit. The Log of Industrial Experience and Achievement records relating to MEA314 Inspect, test and troubleshoot gas turbine engine systems and components may be accepted as also meeting the evidence requirements for this unit.

MEA323 Perform advanced troubleshooting in aircraft mechanical maintenance

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of system theory knowledge and advanced fault diagnostic skills to identify during the performance of scheduled or unscheduled maintenance the cause of defects in fixed and rotary wing aircraft that are beyond the bounds of maintenance manual fault diagnosis guides. This may be done during individual activities or during supervision of other personnel.

The unit covers competencies required to progress from an Aircraft Maintenance Engineer (AME) at Certificate IV to the granting of a chosen B1 maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide and the Companion Volume CASA Interface.

The skills and knowledge covered by the units of competency listed in the MEA Aeroskills Training Package for Aircraft Maintenance Engineer (Avionics or Mechanical as applicable) at Certificate IV are prerequisite to the attainment of the elements of competency specified in this unit. This includes full coverage of the CASR Part 66 Avionics or Mechanical Syllabus subjects/topics listed in the Companion Volume CASA Interface.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|----------------------|--|
| 1. Verify the defect | 1.1 Available information from flight crew, such as flight phase, aircraft configuration, and so on; maintenance |
|----------------------|--|

- documentation both current and previous history; is used as necessary, to assist in fault determination
- 1.2 Inspection of the affected system is carried out to check both physical integrity and correct operation
 - 1.3 Information gained from Central Maintenance Systems is verified against physical integrity and correct operation, where applicable, while observing all relevant work health and safety (WHS) requirements
 - 1.4 The effects on a system from interfaces/integration with other systems are taken into account
2. Isolate the defect
 - 2.1 Logical processes, including the application of basic principles and system knowledge and known facts, are used to augment maintenance manual fault diagnosis guides to ensure efficient and accurate troubleshooting
 - 2.2 Specialist advice is obtained, where required and/or available, to assist with the troubleshooting process
 - 2.3 Faults are located and the causes of the defects are clearly identified and correctly recorded in maintenance documentation, including any other systems disturbed, where required
 3. Determine defect rectification requirements
 - 3.1 Defect rectification requirements are determined and the necessary repair action initiated once verification and isolation of the defect are confirmed
 4. Verify defect rectification
 - 4.1 Defect is rectified in accordance with approved maintenance data
 - 4.2 All systems disturbed or accessed during troubleshooting are restored, as applicable, using maintenance manuals, repair schemes or approved maintenance data while observing relevant WHS procedures
 - 4.3 All checks required by approved maintenance data to ensure correct operation of all disturbed systems are performed

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Troubleshooting

- The competency applies to the troubleshooting, from first principles, of defects beyond available maintenance data in the systems of fixed or rotary wing aircraft types. Troubleshooting must be demonstrated across a range of typical systems and system components that includes but is not limited to airframes, their engines and all systems (and parts thereof) operated by inherently mechanical or hydro-mechanical principles or means. Coverage is not required of specific type systems that are included in type training and practical consolidation of training (PCT) activities leading to a specific type licence rating

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Applicable systems include:

- Hydro-mechanical systems
- Pneumatic systems
- Flight control systems
- Engines and engine systems
- Propeller and rotor systems

Unit Mapping Information

Release 1 – equivalent to MEA323B Perform advanced troubleshooting in aircraft mechanical maintenance

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA323 Perform advanced troubleshooting in aircraft mechanical maintenance

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures
- diagnosing faults that are beyond the coverage of maintenance manual fault diagnosis guides in simulated applications in the training environment and/or in the workplace across a representative range of systems and components.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications related to mechanical systems, and where applicable other system interfaces/integration. It is essential that system test procedures take into account all safety precautions applicable to the system being maintained. Ability to interpret inspection procedures and specifications (allowable limits) and ensure that they are applied in practice is critical, as is the demonstrated ability to apply fundamental system theory in the logical diagnosis of complex faults.

Evidence of transferability of skills and knowledge related to performance and supervision of inspection, testing and troubleshooting is essential. This must be demonstrated through application across a number of the applicable systems listed in the Range of Conditions, including system interfaces/integration.

Knowledge Evidence

For systems and components relevant to the scope of the licence/ratings sought knowledge is required of:

- theory related to system operation and interfaces between systems and with electrical/electronic control media to a level that will facilitate the diagnosis of faults beyond the level of maintenance manual fault diagnosis guides using reported symptoms and functional test results
- component construction and theory of operation to a level that will facilitate the diagnosis of faults beyond the level of maintenance manual fault diagnosis guides using reported symptoms and functional test results
- advanced fault diagnostic techniques
- condition monitoring and trend analysis techniques.

Assessment Conditions

- Competency is assessed in the workplace or simulated workplace and shall involve successfully dealing with a number of maintenance and fault scenarios across a range of systems listed in the Range of Conditions, and related system components.
- The troubleshooting approach should clearly demonstrate an in-depth knowledge of underpinning theory of a system, with this knowledge being used in a logical process to augment and extend the scope of the aircraft/ system fault-finding guide. The fault rectification work plan should take account of applicable safety (including safe handling of heavy components) and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved and the ability to identify the causes of defects not covered fully by maintenance manual fault diagnosis guides has been demonstrated under supervision without intervention. This shall be established via simulated activities at the CASR Part 147 Maintenance Training Organisation and performance during observed workplace activities.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

Links

Companion Volume implementation guides are found in VETNet -
<https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

MEA325 Weigh aircraft and perform aircraft weight and balance calculations as a result of modifications

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of knowledge regarding aircraft weighing and the use of relevant maintenance publications and modification data (where applicable) to weigh a fixed and rotary wing aircraft and use the results to calculate centre of gravity and confirm that it is within limits. Weighing may be performed during scheduled or unscheduled maintenance and involve individual activities and the supervision of other personnel.

The unit covers competencies required to progress from an Aircraft Maintenance Engineer (AME) at Certificate IV to the granting of a chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide and the Companion Volume CASA Interface.

The skills and knowledge covered by the units of competency listed in the MEA Aeroskills Training Package for Aircraft Maintenance Engineer (Avionics or Mechanical as applicable) at Certificate IV are prerequisite to the attainment of the elements of competency specified in this unit. This includes full coverage of the CASR Part 66 Syllabus subjects/topics listed in the Companion Volume CASA Interface.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-------------------|---|
| 1. Weigh aircraft | 1.1 The requirement for aircraft weighing is determined |
|-------------------|---|

- 1.1 Aircraft is weighed in accordance with the specified procedure while observing all relevant work health and safety (WHS) requirements
- 1.3 Aircraft weighing results are provided to the Continuing Airworthiness Management Organisation (CAMO)
2. Calculate the weight and balance impact of a modification
 - 2.1 The new empty weight of the aircraft is determined and it is ensured that the weight is within the predetermined limits set by the CAMO
 - 2.2 The new empty weight centre of gravity of the aircraft is calculated and it is ensured that the centre of gravity is within the predetermined limits set by the CAMO
 - 2.3 Maintenance records are updated with new figures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Centre of gravity of the aircraft is calculated:

- Using the results obtained by weighing an aircraft
- Using the weight and moment arm data for a modification

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA325B Weigh aircraft and perform aircraft weight and balance calculations as a result of modifications

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA325 Weigh aircraft and perform aircraft weight and balance calculations as a result of modifications

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures
- configuring aircraft for weighing
- weighing aircraft
- using weighing results to calculate centre of gravity.

The underlying skills inherent in this unit should be transferable across a range of aircraft types. Ability to interpret the instructions for configuring and weighing aircraft is critical.

Evidence of transferability of skills and knowledge related to weighing of aircraft and calculation of centre of gravity is essential.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- types of weighing equipment used to weigh aircraft and associated safety precautions:
 - mechanical platform scales
 - electronic platform scales
 - electronic load pots
- methods used to level aircraft for weighing
- the importance of correctly configuring aircraft for weighing
- mathematical formulae used to calculate centre of gravity.

Assessment Conditions

- Competency may be assessed in the workplace or in the training environment. The aircraft weighing work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards, especially in relation to aircraft jacking and levelling.

- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision without intervention. This shall be established via simulated activities at the CASR Part 147 Maintenance Training Organisation and performance during observed workplace activities.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA327 Fabricate and/or repair aircraft mechanical components or parts

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of relevant maintenance manuals, drawings and specifications to fabricate and repair a range of fixed and rotary wing aircraft mechanical components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) and Structures Certificate IV training pathways.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Fabricate mechanical components or parts | <ul style="list-style-type: none"> 1.1 Specifications are interpreted to determine the dimensions and procedure for fabrication 1.2 Appropriate materials, tools, equipment and assembly or fabrication jigs are selected and prepared for the particular specification requirements 1.3 Components or parts are fabricated in accordance with required specifications while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) 1.4 Test equipment and rigs are used, where applicable, to confirm serviceability of finished components 1.5 Fabricated components are tagged, sealed and packaged within specified procedures 1.6 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 2. Repair mechanical components or parts | <ul style="list-style-type: none"> 2.1 Repair or replacement requirements are determined, following disassembly and assessment of component parts for serviceability, in accordance with the relevant maintenance documentation while observing all relevant WHS requirements, including the use of MSDS and items of PPE 2.2 Tagging and repair instructions are accurately specified for parts requiring specialist repair 2.3 Components are modified, as approved, by relevant manufacturers' bulletins or procedures 2.4 Mechanical component parts are assembled within |

specified tolerances and in accordance with the appropriate maintenance documents

- 2.5 Mechanical components are adjusted, as required, to operate within prescribed specifications
- 2.6 Repaired components are tagged, sealed and packaged in accordance with specified procedures
- 2.7 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Applicable components to be fabricated and/or repaired include:

- Hose assemblies
- Pipes
- Cables, pulleys, chains, sprockets and gear drives
- Control rods, bellcranks and links

Repair includes:

- Standard techniques for pipes and replacement of eye-ends, tubes or bearings for control rods/pulleys/sprockets and bushes or bearings for bellcranks and links

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA327B Fabricate and/or repair aircraft mechanical components or parts

Assessment Requirements for MEA327 Fabricate and/or repair aircraft mechanical components or parts

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation, specifications and aircraft/component manuals to:
 - recognise state of serviceability and repair requirements for the range of mechanical components listed in the Range of Conditions
 - fabricate components
 - identify requirements and complete repairs
 - test and/or adjust components, as required
- correctly tagging, sealing and packaging completed components.

The underlying skills inherent in this unit should be transferable across a range of fabrication and repair applications associated with aircraft components. It is essential that the relevant procedures are interpreted and applied to ensure quality and safety standards are achieved. This shall be demonstrated through application across a number of different aircraft components listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component operation
- fabrication and repair procedures and processes
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures
- relevant WHS practices
- how to obtain MSDS
- use of PPE.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general and special-purpose tools and test equipment found in most routine situations would be used where appropriate.
- Evidence of knowledge about the general aspects of material specification and selection, measurement, fabrication and repair should be related to specific aircraft component applications. Ability to assess component serviceability and interpret parts requirements will be necessary before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one item from each of the following groups:
 - hose assemblies
 - pipes
 - cables, pulleys, chains, sprockets and gear drives
 - control rods, bellcranks and links.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA328 Maintain and/or repair aircraft mechanical components or parts will have fully met the criteria for Element 2. The Log of Industrial Experience and Achievement records relating to MEA328 Maintain and/or repair aircraft mechanical components or parts may be accepted as also meeting the evidence requirements for the Performance Criteria for this Element.

MEA328 Maintain and/or repair aircraft mechanical components or parts

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of relevant maintenance publications to maintain and repair a range of aircraft mechanical components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include fixed and rotary wing aircraft, and components in workshops.

This unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA302	Remove and install aircraft hydro-mechanical and landing gear system components
MEA303	Remove and install aircraft pneumatic system components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|---|
| 1. Maintain and/or repair mechanical components or parts | 1.1 Maintenance and/or repair requirements are determined, following disassembly and assessment of component parts for serviceability, in accordance with the relevant maintenance documentation |
| | 1.2 Tagging and repair instructions are accurately specified for parts requiring specialist repair |
| | 1.3 Appropriate materials, tools, equipment and assembly or fabrication jigs are selected and prepared for the particular specification requirements |
| | 1.4 Components or parts are maintained, repaired or modified, as approved by relevant manufacturers' bulletins or procedures, in accordance with required specifications while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.5 Mechanical component parts are assembled within specified tolerances and in accordance with the appropriate maintenance documents |
| | 1.6 Mechanical components are adjusted, as required, to operate within prescribed specifications |
| | 1.7 Test equipment and rigs are used, where applicable, to confirm serviceability |
| | 1.8 Maintained/repaired or modified components are tagged, sealed and packaged within specified procedures |
| | 1.9 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Components or parts to be maintained and/or repaired include:

- Hoses
- Pipes
- Cables, pulleys, chains, sprockets and gear drives
- Control rods, bellcranks and links
- Non-structural removable components of fuselages, fairings, nacelles, empennage, wings and thrust reversers. for non-pressurised aircraft – entry, cargo, access doors and associated seals, windows and transparent panels
- Trim panels, linings, seats, cabin equipment and consoles, floor panels, coverings and emergency equipment (including passenger escape systems, inflatable slides, life jackets, rafts, location transmitters, beacons, and cargo, crew and/or passenger seat restraints)

Repair includes:

- Standard techniques for pipes and replacement of eye-ends, tubes or bearings for control rods/pulleys/sprockets and bushes or bearings for bellcranks and links

Maintain involves:

- Cleaning, inspection for wear or damage, and adjustment and lubrication, where applicable

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA328C Maintain and/or repair aircraft mechanical components or parts

Assessment Requirements for MEA328 Maintain and/or repair aircraft mechanical components or parts

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation, specifications and aircraft/component manuals to:
 - recognise state of serviceability and repair requirements for the range of mechanical components listed in the Range of Conditions
 - identify requirements and complete repairs and/or modifications
 - test and/or adjust components, as required.
- correctly tag, seal and package completed components

The underlying skills inherent in this unit should be transferable across a range of maintenance and repair applications associated with aircraft components. It is essential that the relevant procedures are interpreted and applied to ensure quality and safety standards are achieved.

This shall be demonstrated through application across a number of different aircraft components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- construction, repair procedures and processes for:
 - cables
 - pulleys
 - chains
 - sprockets
 - gear drives
 - control rods
 - bellcranks
 - linkages

- non-structural removable components of fuselages, fairings, nacelles, empennage and wings
- engine thrust reversers
- from unpressurised aircraft:
 - entry, cargo and access doors
 - windows
 - transparent panels
- construction and serviceability criteria for hoses and pipes, including pressure test requirements
- construction, materials, cleaning and repair requirements for:
 - trim panels
 - cabin linings
 - seats
 - cabin equipment and consoles
 - floor panels
 - coverings
 - emergency equipment and stowages
 - cargo, crew and/or passenger seat restraints
- relevant WHS practices
- how to obtain MSDS
- use of PPE
- relevant maintenance manuals, standards and specifications
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general and special-purpose tools and test equipment found in most routine situations would be used where appropriate.
- Ability to assess component serviceability and interpret parts requirements will be necessary before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of components or parts from each of the following groups:
 - hoses
 - pipes
 - cables, pulleys, chains, sprockets and gear drives
 - control rods, bellcranks and links

- non-structural removable components of fuselages, fairings, nacelles, empennage, wings and thrust reversers. for non-pressurised aircraft – entry, cargo, access doors and associated seals, windows and transparent panels
- trim panels, linings, seats, cabin equipment and consoles, floor panels, coverings and emergency equipment (including passenger escape systems, inflatable slides, life jackets, rafts, location transmitters, beacons, and cargo, crew and/or passenger seat restraints).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA327 Fabricate and/or repair aircraft mechanical components or parts will have partially met the performance criteria for Element 1 for some of the listed variables. The Log of Industrial Experience and Achievement records relating to MEA327 Fabricate and/or repair aircraft mechanical components or parts may be accepted as also meeting the evidence requirements for the performance criteria for this Element in respect to common variables.

MEA329 Maintain aircraft basic hydraulic and pneumatic components or parts

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and use of maintenance documentation to maintain, repair and modify aircraft basic hydraulic and pneumatic components during scheduled or unscheduled maintenance under the guidance of a qualified person. Work under the guidance of a qualified person may be performed individually or as part of a team.

Applications include fixed and rotary wing aircraft components either attached to the aircraft or in a workshop.

The unit is part of a Mechanical Certificate II training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |

and repair activities

accordance with standard enterprise procedures

- 3.2 Maintained/repaired or modified components are tagged, sealed and packaged within specified procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Components to be maintained and/or repaired/modified include:

- Hoses
- Pipes
- Simple check or shutoff valves
- Basic hydraulic and pneumatic actuators and valves

Routine work:

- Is carried out using basic operational knowledge and a defined range of skills ('routine' work is that which follows a customary or regular course of procedure)

Work outcomes:

- Are achieved by applying known solutions chosen from a limited range of pre-determined options consistent with enterprise procedures. This includes accepting responsibility for own work in terms of quality of outcomes using pre-determined specifications of quality

Scope of work:

- Note that the scope of any repair or modification and the procedure to be followed will be provided by the qualified person, and be within the scope of the skills and knowledge included in the unit of competency MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Maintain includes:

- Cleaning, inspection for wear or damage and consequent replacement of parts, and routine adjustment and lubrication, where applicable, in accordance with enterprise procedures

Procedures and requirements include:

- Industry procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA329 Maintain aircraft basic hydraulic and pneumatic components or parts

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation, specifications and aircraft/component manuals to:
 - recognise state of serviceability and standard/routine repair requirements for the range of hydraulic and pneumatic components listed in the Range of Conditions
 - identify requirements under the guidance of a qualified person and complete routine repairs and/or modifications
 - adjust components under expert guidance as required
 - where post-assembly testing is applicable, set up components for testing and have a basic understanding of the test procedures
- correctly tagging, sealing and packaging completed components.

The underlying skills inherent in this unit should be transferable across a range of maintenance and repair applications associated with aircraft components. It is essential that the relevant enterprise procedures are interpreted and applied to ensure quality and safety standards are achieved.

This shall be demonstrated through application across a number of different aircraft components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component operation at a basic level
- standard/routine repair procedures and processes
- relevant WHS practices
- how to obtain MSDS
- use of PPE.

For the purpose of this unit of competency, basic knowledge is defined as the level of knowledge required to:

- understand the instructions provided by qualified persons and relevant documentation for the disassembly, routine replacement of component parts and seals and reassembly of components
- under guidance and in the training environment, make post-assembly adjustments, such as length of stroke or operating pressure
- under guidance and in the training environment, perform simple tests involving pressure and function.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that applicable general and special-purpose tools found in most routine situations would be used where appropriate.
- Ability to assess component serviceability under qualified person guidance and interpret parts requirements will be necessary before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under qualified person guidance on a representative range of components or parts from each of:
 - hoses
 - pipes
 - simple check or shutoff valves
 - basic hydraulic and pneumatic actuators and valves.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA330 Maintain aircraft non-primary structural removable components or parts and internal fittings

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and use of maintenance documentation to dismantle, inspect, maintain and assemble aircraft non-primary structural removable components and interior fittings/emergency equipment during scheduled or unscheduled maintenance under the guidance of a qualified person. Work under the guidance of a qualified person may be performed individually or as part of a team.

Applications include fixed and rotary wing aircraft components either attached to the aircraft or in a workshop.

The unit is part of a Mechanical Certificate II training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Prepare to dismantle, inspect, maintain and assemble non-primary structural removable components or parts and internal fittings | 1.1 Components are removed and/or disassembled in accordance with enterprise procedures, relevant maintenance documentation and qualified person guidance while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.2 Maintenance and/or repair requirements as defined by the qualified person, enterprise procedures and the relevant maintenance documentation are understood |
| | 1.3 Tagging and repair instructions are accurately specified in accordance with enterprise procedures and qualified person directions for parts requiring specialist repair |
| | 1.4 Appropriate materials, tools, equipment and assembly or fabrication jigs, where applicable, are selected and prepared for the particular maintenance and repair requirements in accordance with enterprise procedures and relevant maintenance documentation |
| 2. Dismantle, inspect, maintain and assemble non-primary structural removable components or parts and internal fittings | 2.1 Routine maintenance, repair or modification processes are carried out as approved by relevant manufacturers' bulletins or procedures, in accordance with required enterprise procedures and specifications while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 2.2 Component parts are assembled within specified tolerances in accordance with enterprise procedures and the appropriate maintenance documents |
| | 2.3 Where applicable and as required by the qualified person, assistance is provided in the conduct of final load or functional tests |

- | | |
|--|--|
| 3. Complete maintenance/ modification activities | 3.1 Required documentation is completed and processed in accordance with standard enterprise procedures |
| | 3.2 Where applicable, maintained/repaired or modified components are tagged, sealed and packaged within specified procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Routine maintenance, repair or modification processes are performed on:

- Non-structural removable components of fuselages, fairings, nacelles, empennage, wings and thrust reversers. For non-pressurised aircraft – entry, cargo, access doors and associated seals, windows and transparent panels
- Trim panels, linings, seats, cabin equipment and consoles, floor panels, coverings, emergency equipment, including passenger escape systems and inflatable slides, where appropriate (excluding removal and installation of slides fitted to wide-bodied aircraft), and cargo, crew and/or passenger seat restraints
- Stowages for life jackets, rafts, location transmitters and beacons, including the removal and installation of the equipment, where applicable

Routine work:

- Is carried out using basic operational knowledge and a defined range of skills ('routine' work is that which follows a customary or regular course of procedure)

Work outcomes:

- Are achieved by applying known solutions chosen from a limited range of pre-determined options consistent with enterprise procedures. This includes accepting responsibility for own work in terms of quality of outcomes using pre-determined specifications of quality

Primary structure:

- Note that 'primary structure/structural' refers to all components of an aircraft, the failure of which would

- seriously endanger safety, e.g. wing or tailplane spars, main fuselage frames, engine bearers, portions of skin that are highly stressed. 'Non-primary' refers to any other items
- The scope of any modification and the procedure to be followed:**
- The scope of any modification and the procedure to be followed will be provided by the qualified person, and be within the scope of the skills and knowledge included in the unit of competency MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance
- Repair includes:**
- Standard techniques as defined by the qualified person and/or the relevant maintenance manual
- Maintain includes:**
- Removal and installation, cleaning, inspection for wear or damage and consequent replacement of parts, and routine adjustment and lubrication, where applicable, in accordance with enterprise procedures
- Procedures and requirements include:**
- Industry procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA330B Dismantle, inspect, maintain and assemble aircraft non-primary structural removable components or parts and internal fittings

Assessment Requirements for MEA330 Maintain aircraft non-primary structural removable components or parts and internal fittings

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation, specifications and aircraft/component manuals to:
 - for on-aircraft work, correctly remove and install components covered by the Range of Conditions, including emergency equipment
 - recognise state of serviceability and standard/routine repair requirements for the range of components listed in the Range of Conditions
 - identify requirements under the guidance of a supervisor and complete repairs and/or modifications
 - adjust components under expert guidance, as required
 - where load or functional testing is applicable, in the training environment, set up components for testing and perform tests
- correctly tagging, sealing and packaging completed components.

The underlying skills inherent in this unit should be transferable across a range of maintenance and repair applications associated with the aircraft components listed in the Range of Conditions. It is essential that the relevant enterprise procedures are interpreted and applied to ensure quality and safety standards are achieved.

This shall be demonstrated through application across a number of different aircraft components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component construction and/or operation at a basic level
- standard/routine repair procedures and processes
- relevant WHS practices
- how to obtain MSDS

- use of PPE.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that applicable general and special-purpose tools found in most routine situations would be used where appropriate, and that competency would be demonstrated in setting up components for functional or load testing where such routine tests are specified.
- Ability to assess component serviceability and interpret parts requirements will be necessary before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under qualified person guidance on a representative range of components or parts from each of:
 - non-structural removable components of fuselages, fairings, nacelles, empennage, wings and thrust reversers. For non-pressurised aircraft – entry, cargo, access doors and associated seals, windows and transparent panels
 - trim panels, linings, seats, cabin equipment and consoles, floor panels, coverings, emergency equipment, including passenger escape systems and inflatable slides where appropriate (excluding removal and installation of slides fitted to wide-bodied aircraft), and cargo, crew and/or passenger seat restraints
 - stowages for life jackets, rafts, location transmitters and beacons (including the removal and installation of the equipment where applicable).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA331 Maintain aircraft gas turbine engine components or parts

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and use of maintenance documentation to dismantle, inspect, maintain and assemble aircraft gas turbine engine components or parts during scheduled or unscheduled maintenance under the guidance of a qualified person. Work under the guidance of a qualified person may be performed individually or as part of a team.

Applications include gas turbine engine components or parts in a workshop.

The unit is part of a Mechanical Certificate II training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Prepare to dismantle, inspect, maintain and assemble aircraft gas turbine engine components or parts | <p>1.1 Components are removed and/or disassembled in accordance with enterprise procedures, relevant maintenance documentation and qualified person guidance while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)</p> <p>1.2 Maintenance and/or repair requirements as defined by the qualified person, enterprise procedures and the relevant maintenance documentation are understood</p> <p>1.3 Tagging and repair instructions are accurately specified in accordance with enterprise procedures and qualified person directions for parts requiring specialist repair</p> <p>1.4 Appropriate materials, tools, equipment and assembly or fabrication jigs, where applicable, are selected and prepared for the particular maintenance and repair requirements in accordance with enterprise procedures and relevant maintenance documentation</p> |
| 2. Dismantle, inspect, maintain and assemble aircraft gas turbine engine components or parts | <p>2.1 Routine maintenance, repair or modification procedures are carried out, as approved by relevant manufacturers' bulletins or procedures, in accordance with required enterprise procedures and specifications while observing all relevant WHS requirements, including the use of MSDS and items of PPE</p> <p>2.2 Component parts are assembled within specified tolerances and in accordance with enterprise procedures and the appropriate maintenance documents</p> <p>2.3 Where applicable and as required by the qualified person, assistance is provided in the final adjustment and testing of components to confirm serviceability</p> |
| 3. Complete maintenance repair or modification | <p>3.1 Required documentation is completed and processed in accordance with standard enterprise procedures</p> |

activities

- 3.2 Maintained/repaired or modified components are tagged, sealed and packaged within specified procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Routine work:**
 - Is carried out using basic operational knowledge and a defined range of skills ('routine' work is that which follows a customary or regular course of procedure).
- Work outcomes:**
 - Are achieved by applying known solutions chosen from a limited range of pre-determined options consistent with enterprise procedures. This includes accepting responsibility for own work in terms of quality of outcomes using pre-determined specifications of quality.
- Components to be maintained include:**
 - Basic components, such as oil coolers, fuel nozzles, flex drive shafts, fuel manifolds and engine bearings, engine change unit hoses, pipes and ducts, and like components fitted to modular assemblies and sub-assemblies
- Components to be repaired or modified include:**
 - Compressor and turbine blades
- Scope of work:**
 - Note that the scope of any repair or modification and the procedure to be followed will be provided by the qualified person, and be within the scope of the skills and knowledge included in the unit of competency MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance
- Maintain includes:**
 - Removal and installation, cleaning, inspection for wear or damage and consequent replacement of parts, and routine adjustment and lubrication, where applicable, in accordance with enterprise procedures
- Procedures and**
 - Industry procedures specified by manufacturers, regulatory authorities or the enterprise

requirements include:

ME A332 Maintain aircraft mechanical components or parts

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and use of maintenance documentation to dismantle, inspect, maintain and assemble aircraft mechanical components or parts during scheduled or unscheduled maintenance under the guidance of a qualified person. Work under the guidance of a qualified person may be performed individually or as part of a team.

Applications include components or parts either attached to the aircraft or in a workshop. It does not include work on hydraulic and pneumatic components or parts.

The unit is part of a Mechanical Certificate II training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|---|-----|--|
| 1. | Prepare to dismantle, inspect, maintain and assemble basic mechanical components or parts | 1.1 | Components are removed and/or disassembled in accordance with enterprise procedures, relevant maintenance documentation and qualified person guidance while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | | 1.2 | Maintenance and/or repair requirements as defined by the qualified person, enterprise procedures and the relevant maintenance documentation are understood |
| | | 1.3 | Tagging and repair instructions are accurately specified in accordance with enterprise procedures and qualified person directions for parts requiring specialist repair |
| | | 1.4 | Appropriate materials, tools, equipment and assembly or fabrication jigs, where applicable, are selected and prepared for the particular maintenance and repair requirements in accordance with enterprise procedures and relevant maintenance documentation |
| 2. | Maintain and/or repair mechanical components or parts | 2.1 | Routine maintenance, repair or modification procedures are carried out, as approved by relevant manufacturers' bulletins or procedures, in accordance with required enterprise procedures and specifications while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | | 2.2 | Mechanical component parts are assembled within specified tolerances in accordance with enterprise procedures and the appropriate maintenance documents |
| | | 2.3 | Where applicable and as required by the qualified person, assistance is provided in the final adjustment of components to confirm serviceability |
| 3. | Complete maintenance/ | 3.1 | Required documentation is completed and processed |

repair activities in accordance with standard enterprise procedures

- 3.2 Maintained/repaired or modified components are tagged, sealed and packaged within specified procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Routine work:**
- Is carried out using basic operational knowledge and a defined range of skills ('routine' work is that which follows a customary or regular course of procedure)
- Outcomes:**
- Are achieved by applying known solutions chosen from a limited range of pre-determined options consistent with enterprise procedures. This includes accepting responsibility for own work in terms of quality of outcomes using pre-determined specifications of quality
- Basic components to be maintained and/or repaired/modified include:**
- Pulleys
 - Chains
 - Sprockets
 - Gear drives
 - Control rods
 - Bellcranks and links
- Scope of work:**
- Note that the scope of any repair or modification and the procedure to be followed will be provided by the qualified person, and be within the scope of the skills and knowledge included in the unit of competency MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance
- Repair includes:**
- Replacement of parts such as eye-ends, tubes, bearings and bushes
- Maintain includes:**
- Cleaning, inspection for wear or damage and routine adjustment and lubrication where applicable in accordance with enterprise procedures

Procedures and requirements include:

- Industry procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA332 Maintain aircraft mechanical components or parts

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation, specifications and aircraft/component manuals to:
 - recognise state of serviceability and standard/routine repair requirements for the range of mechanical components listed in the Range of Conditions
 - identify requirements under the guidance of a qualified person and complete routine repairs and/or modifications
 - adjust components under qualified person guidance as required
 - where post-assembly testing is applicable, under guidance and in the training environment, set up components for testing and perform tests
- correctly tagging, sealing and packaging completed components.

The underlying skills inherent in this unit should be transferable across a range of maintenance and repair applications associated with aircraft components. It is essential that the relevant enterprise procedures are interpreted and applied to ensure quality and safety standards are achieved.

This shall be demonstrated through application across a number of different aircraft components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component operation at a basic level
- standard/routine repair procedures and processes
- relevant WHS practices
- how to obtain MSDS
- use of PPE.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that general and special-purpose tools found in most routine situations would be used where appropriate.
- Ability to assess component serviceability under qualified person guidance and interpret parts requirements will be necessary before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under qualified person guidance on a representative range of basic components, including:
 - cables
 - pulleys
 - chains
 - sprockets
 - gear drives
 - control rods
 - bellcranks and links.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA333 Maintain aircraft piston engine components or parts

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and use of maintenance documentation to dismantle, inspect, maintain and assemble aircraft piston engine components or parts during scheduled or unscheduled maintenance under the guidance of a qualified person. Work under the guidance of a qualified person may be performed individually or as part of a team.

Applications include piston engine components or parts in a workshop.

The unit is part of a Mechanical Certificate II training pathway. Achievement of this unit will contribute towards the attainment of units MEA392 Disassemble aircraft piston engines, MEA393 Repair and/or overhaul aircraft piston engine cylinder assembly components, MEA394 Repair and/or overhaul aircraft piston engine crankcase assembly components and MEA395 Reassemble aircraft piston engines.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|---|-----|---|
| 1. | Prepare to dismantle inspect, maintain and assemble piston engine components or parts | 1.1 | Maintenance and/or repair requirements as defined by the qualified person, standard enterprise procedures and the relevant maintenance documentation are understood |
| | | 1.2 | Tagging and repair instructions are accurately specified in accordance with standard enterprise procedures and as directed by a qualified person for parts requiring specialist repair |
| | | 1.3 | Appropriate materials, tools, equipment and assembly or fabrication jigs, where applicable, are selected and prepared for the particular maintenance and repair requirements in accordance with standard enterprise procedures and relevant maintenance documentation |
| 2. | Dismantle, inspect, maintain and assemble aircraft piston engine components or parts | 2.1 | Components are removed and/or disassembled in accordance with standard enterprise procedures, relevant maintenance documentation and qualified person guidance while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | | 2.2 | Routine maintenance, repair or modification procedures are carried out, as approved by relevant manufacturers' bulletins or procedures, in accordance with required standard enterprise procedures and specifications while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | | 2.3 | Component parts are assembled within specified tolerances and in accordance with standard enterprise procedures and the appropriate maintenance documents |
| | | 2.4 | Where applicable, and as required by the qualified person, assistance is provided in the final adjustment |

and testing of components to confirm serviceability

- | | | | |
|----|---|-----|--|
| 3. | Complete maintenance, repair or modification activities | 3.1 | Required documentation is completed and processed in accordance with standard enterprise procedures |
| | | 3.2 | Maintained/repaired or modified components are tagged, sealed and packaged within specified procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Routine work:

- Is carried out using basic operational knowledge and a defined range of skills ('routine' work is that which follows a customary or regular course or procedure)

Work outcomes

- Are achieved by applying known solutions chosen from a limited range of pre-determined options consistent with standard enterprise procedures. This includes accepting responsibility for own work in terms of quality of outcomes using pre-determined specifications of quality

Scope of work:

- Note that the scope of any repair or modification and the procedure to be followed will be provided by the qualified person, and will be within the scope of the unit of competency MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Maintain includes:

- Removal and installation, cleaning, inspection for wear or damage and consequent replacement of parts, and routine adjustment and lubrication where applicable, in accordance with standard enterprise procedures

Components to be maintained include:

- Hoses, pipes, ducts and components of:
 - cooling systems
 - engine cylinder assemblies

- engine crankcase assemblies
 - accessory drives
 - lubrication systems
- Procedures and requirements include:**
- Industry procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA333 Maintain aircraft piston engine components or parts

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- using relevant maintenance documentation, specifications and aircraft/component manuals to:
 - recognise state of serviceability and standard/routine maintenance and repair requirements for the range of engine components listed in the Range of Conditions
 - identify requirements under the guidance of a qualified person and complete repairs and/or modifications
- correctly tagging, sealing and packaging completed components.

The underlying skills inherent in this unit should be transferable across a range of maintenance and repair applications associated with engine components. It is essential that the relevant standard enterprise procedures are interpreted and applied to ensure quality and safety standards are achieved.

This shall be demonstrated through application across a number of different aircraft components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- component operation at a basic level
- standard/routine repair procedures and processes
- relevant WHS practices
- how to obtain MSDS
- use of PPE.

For the purpose of this unit, basic knowledge is defined as the level of knowledge required to:

- remove, install and maintain components such as hoses, pipes and ducts etc
- dismantle and maintain engine assemblies and sub-assemblies

- apply unit MEA109 Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance, skills to repair or modify components of sub-assemblies and systems listed in the Range of Conditions.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment, using tools and equipment specified in maintenance documentation. It is also expected that applicable general and special-purpose tools found in most routine situations would be used where appropriate.
- Ability to assess component serviceability under qualified person guidance and interpret parts requirements will be necessary before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under qualified person guidance on a representative range of components or parts, as follows:
 - cooling systems
 - engine cylinder assemblies
 - engine crankcase assemblies
 - accessory drives
 - lubrication systems.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA339 Inspect, repair and maintain aircraft structures

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of procedures and techniques associated with the inspection and maintenance of aircraft structures, and with the performance of a limited range of metal and composite repairs during scheduled or unscheduled maintenance, including special inspections required after events, such as heavy landings, overstress or flight through heavy turbulence. Applications include the individual or team-related performance of structural maintenance activities on fixed or rotary wing aircraft on the flight line or in the hangar.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA304 Remove and install non-pressurised aircraft structural and non-structural components

OR

MEA317 Remove and install pressurised aircraft structural and non-structural components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|--|-----|---|
| 1. | Inspect aircraft structure | 1.1 | Relevant maintenance documentation is used to identify specific inspection requirements |
| | | 1.2 | Appropriate preparation and access to the aircraft structure is undertaken to allow for proper inspection in accordance with maintenance documentation |
| | | 1.3 | Aircraft structure is visually or physically checked for signs of deformation defects or damage in accordance with maintenance documentation and approved procedures while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | | 1.4 | Damage or defects are assessed against damage or wear limits specified by structural repair manual or other approved data to determine if repair or replacement is required |
| | | 1.5 | Maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 2. | Prepare to undertake repair | 2.1 | Extent of damage is correctly assessed to assist in determining repair procedure |
| | | 2.2 | Appropriate repair scheme is identified in accordance with structural repair manual and/or approved data |
| | | 2.3 | Specialist advice is obtained in establishing an approved repair scheme where a standard repair scheme cannot be identified or damage is out of limits |
| | | 2.4 | All materials and equipment required are organised |
| 3. | Repair and maintain aircraft structure | 3.1 | Structural repairs are performed in accordance with approved repair scheme ensuring that aircraft standard practices are used and process requirements are carried out while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | | 3.2 | Preventative maintenance techniques are employed to |

preserve the integrity of aircraft structure

- 3.3 Work area is cleaned of all waste material or contaminants
- 3.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Inspection of aircraft structure includes:

- Non-ferrous and ferrous alloys and composite (FRP) materials used in aircraft construction
- Structural fastening and attachment hardware and/or devices
- Seals and sealants
- Glass and moulded plastics
- Application of non-destructive testing (NDT) techniques
- Doors, hinges and locking mechanisms for damage/misalignment
- Inspections applicable to each of safe life, damage tolerant and fail safe structure relevant to enterprise
- Ageing aircraft inspection programs

Damage or defects include:

- Impact damage
- Fatigue cracking
- Corrosion
- Delamination of composites and bonded structures

Structural repairs include:

- Remove corrosion by chemical and mechanical methods
- Restore protective coatings
- Apply sealants and jointing compounds
- Freehand precision hole generation
- Remove and install structural hardware and fastening devices

- Remove and replace bushes, bearings and bearing surfaces
 - Metal scab patch, flush, splice, lap and formed section repair
 - Composite external patch, scarf, stepped and bolted repairs
- Specialist advice is obtained from:**
- Supervisors
 - Specialist structures personnel
- Relevant maintenance documentation includes:**
- Servicing schedules
 - Maintenance manuals
 - Applicable Defence regulations and instructions
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA339 Inspect, repair and maintain aircraft structures

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying all relevant WHS procedures, including the use of MSDS and selection and use of applicable items of PPE
- demonstrating appropriate cleaning procedures to enable structure inspection
- demonstrating correct inspection procedures, in particular pressurised aircraft, in accordance with aircraft and procedures manuals
- identifying damage to aircraft metallic (ferrous and non-ferrous) structures and/or components by way of impact, fatigue or the various types of corrosion
- inspecting damage and assessing composite components/structures
- identifying various aircraft metals and their basic properties
- identifying composite materials used in aircraft construction, associated safety precautions and hazards
- correctly interpreting repair scheme drawings, including third angle projection, isometric, sectional formats and hand sketches
- using appropriate hand tools and machines, including riveting equipment, drilling equipment, aligning tools and material fasteners (grip pins)
- applying correct removal, installation and repair techniques for:
 - a range of rivets (blind and solid) using hand, squeeze and pneumatic situations
 - a range of close tolerance fasteners (standard and oversize – hillocks and taper locks), including hole preparation
 - threaded devices, including internal and external thread cutting, Helicoil inserts and damaged stud replacement
 - hardware assembled by close tolerance fits using heat, cooling and force methods, including bearings, bushes and inserts
- performing a range of metal structure and composite material repair techniques, including:
 - metal scab patch, flush, splice, lap and formed section repair
 - composite external patch, scarf and stepped repairs
 - bolted repairs to composite skin
 - metal to metal and metal to composite bonding
- applying structural corrosion removal/treatment techniques
- restoring aircraft structure sealing and surface finishes.

It is essential that the procedures take into account all aircraft and personal safety precautions relating to aircraft structure.

Evidence of transferability of skills and knowledge related to inspection, testing and repair of aircraft structure is essential. This shall be demonstrated through application across a number of different aircraft components as listed in the Assessment Conditions.

Ability to interpret inspection and repair procedures and specifications and apply them in practice is critical. The application of the procedures should also clearly indicate knowledge of structural flight loads and aerodynamic requirements.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- applicable WHS procedures, including the use of MSDS and PPE
- construction methods and materials used in:
 - fuselage sections
 - wing sections
 - engine nacelles and mounts
 - windows and window frames
 - doors, locks and access panels in pressurised and non-pressurised aircraft
- definition of structural terms, i.e. safe life, damage tolerant, failsafe, stress, strain, shear and cycles
- inspection requirements for metal and composite structure, including:
 - ageing aircraft inspection requirements
 - safe life structure
 - damage tolerant structure
 - fail safe structure
- potential causes of structural failure
- NDT methods and application of the various techniques
- construction methods of, and assessing common defects in, aircraft plastic transparencies
- basic constructional features of, and assessing common defects in, glass windscreens
- the various forms of structural corrosion, stating the causes and structural effects of corrosion on aircraft
- the terms associated with composite materials
- requirements for handling and storing aircraft metals and composite materials, including sealing agents, to industry standards
- means of identifying aircraft structural assembly fasteners (metal and composite) by interpretation of markings, numbering systems, size, shape and colour
- assessment of structural damage:
 - types and classes of mechanical damage
 - types of corrosion and determining the extent of damage

- relevant documentation and manuals
- damage limits and repair schemes for metallic and non-metallic structure
- procedures for the fabrication and fitment of metal repairs:
 - scab patch
 - flush patch
 - splice
 - lap
 - formed section
- corrosion removal and passivation
- procedures for performing composite repairs:
 - external patch
 - scarf patch
 - stepped repairs
 - bolted repairs
- repair of integral fuel tanks and sealing of faying surfaces, including specific WHS and PPE requirements
- surface finishes and methods of restoration, including specific WHS and PPE requirements
- how to obtain MSDS
- relevant maintenance and structural repair manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision across the variables in the Range of Conditions as follows:
 - inspection and/or testing of at least one (1) item from each of:
 - non-ferrous and ferrous alloys and composite (FRP) materials used in aircraft construction
 - structural fastening and attachment hardware and/or devices
 - seals and sealants
 - glass and moulded plastics
 - application of NDT techniques
 - doors, hinges and locking mechanisms for damage/misalignment

- inspections applicable to each of safe life, damage tolerant and fail safe structure relevant to enterprise
- ageing aircraft inspection programs
- recognition of each type of damage:
 - impact damage
 - fatigue cracking
 - corrosion
- delamination of composites and bonded structures
- one (1) repair task from each of the following groups:
 - remove corrosion by chemical and mechanical methods
 - restore protective coatings
 - apply sealants and jointing compounds
 - freehand precision hole generation
 - remove and install structural hardware and fastening devices
 - remove and replace bushes, bearings and bearing surfaces
 - metal scab patch, flush, splice, lap and formed section repair
 - composite external patch, scarf and stepped repairs.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where applicable, an equivalent industry evidence guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.
- Individuals being assessed who have already attained MEA369 Inspect and maintain structures and related components of non-pressurised small aircraft, MEA370 Repair the structure of non-pressurised small aircraft and MEA371 Perform major repairs and modifications to small aircraft metal structure will have met the requirements of the Performance Criteria and Range of Conditions variables for Elements 1 to 3 for common variables.
- Those who have attained MEA410 Maintain aircraft structure/components will have met the Performance Criteria and Range of Conditions variables requirements for Element 1.
- The Log of Industrial Experience and Achievement records relating to the units listed above may be accepted as also meeting the evidence requirements for this unit in the applicable areas.

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

MEA340 Lay out and set up aircraft systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of basic knowledge of aircraft system design and schematic layout, including the relative advantages of the different types of system.

The unit is part of Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aeronautical engineering

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Select and lay out schematically aircraft mechanical systems	1.1 Mechanical system applications in aircraft design and their relative advantages and disadvantages compared to other system types are identified
---	---

- 1.2 Components of mechanical systems are identified
- 1.3 A mechanical system is selected for an application, the schematic layout is sketched and all components are labelled
- 1.4 Mechanical system maintenance requirements are identified
2. Select and lay out schematically aircraft hydraulic systems
 - 2.1 Hydraulic system applications in aircraft design, their operation and their relative advantages and disadvantages compared to other system types are identified
 - 2.2 Aircraft hydraulic fluids, their characteristics and handling precautions are identified
 - 2.3 Components of hydraulic systems are identified and their operation is described in general terms
 - 2.4 A hydraulic system is selected for an application, the schematic layout is sketched and all components are labelled
 - 2.5 Hydraulic system maintenance requirements are identified
3. Select and lay out schematically aircraft pneumatic systems
 - 3.1 Pneumatic system applications in aircraft design, their operation and their relative advantages and disadvantages compared to other system types are identified
 - 3.2 Components of pneumatic systems are identified and their operation is described in general terms
 - 3.3 A pneumatic system is selected for an application, the schematic layout is sketched and all components are labelled
 - 3.4 Pneumatic system maintenance requirements are identified
4. Select and lay out schematically aircraft fuel storage and distribution systems
 - 4.1 Typical fuel storage and distribution systems used in aircraft design are identified
 - 4.2 Components of fuel storage and distribution systems are identified and their operation is described
 - 4.3 A fuel storage and distribution system is selected for an application, the schematic layout is sketched and all

		components are labelled
	4.4	Types of aircraft fuel, their characteristics and handling precautions are identified
	4.5	Fuel storage and distribution system maintenance requirements are identified
5.	Set up and operate a simple hydraulic system	5.1 The hydraulic system is sketched and all components are labelled
		5.2 Required components are obtained
		5.3 The system is assembled and operated while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Mechanical system applications include:

- Flight controls
- Flap operation
- Nose wheel steering
- Landing gear door operation
- Entrance door mechanisms

Components of mechanical systems include:

- Cables
- Chains
- Sprockets
- Pulleys
- Fairleads
- Cable tensioners
- Gearboxes

Hydraulic system applications include:

- Screwjacks
- Rods
- Universal joints
- Constant velocity joints
- Clutches
- Bearings and bushes
- Flight controls
- Flap and spoiler operation
- Landing gear retraction and extension
- Brakes (including anti-skid)
- Nose wheel steering
- Shimmy damping
- Door operation

Components of hydraulic systems include:

- Pumps
- Plumbing
- Valves (manual and electrically operated)
- Actuators
- Motors
- Check valves
- Pressure gauges (direct reading and electrical)
- Electrical control circuit micro switches
- Reservoirs
- Accumulators
- Filters

Pneumatic system applications include:

- Landing gear retraction and extension
- Pneumatic emergency systems for landing gear extension and brakes
- Engine bleed air
- Engine starting
- Anti-icing
- De-icing
- Pressurisation
- Air cycle air conditioning

Components of pneumatic systems include:

- Precoolers
- Pressure regulator and shutoff valves
- Temperature modulating valve
- Check valves
- Over-pressure valves
- Temperature regulating valves
- Underloading valves
- Shuttle valves
- Back pressure valves

Components of fuel storage and distribution systems include:

- Outflow valves
- Heat exchangers
- Moisture separators
- Chemical driers
- Filters
- Mechanical compressors
- Compressed air bottles
- De-icing boots
- Ducting
- Integral fuel cells
- Rigid and flexible fuel cells
- External fuel tanks
- Rigid and flexible plumbing and couplings
- Manifolds
- Selector valves
- Anti-surge valves
- Anti-gravity valves
- Fuel quantity indication
- Fuel flow indication
- Boost pumps
- Transfer pumps
- Filters
- Strainers
- Fuel heaters

Unit Mapping Information

Assessment Requirements for MEA340 Lay out and set up aircraft systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- laying out a typical aircraft mechanical system
- laying out a typical aircraft hydraulic system
- laying out a typical aircraft pneumatic system
- laying out a typical fuel storage and distribution system
- setting up and operating a basic hydraulic system that includes:
 - hydraulic rig
 - manual selector valve
 - filter
 - accumulator
 - check valve
 - linear actuators
 - rigid and flexible plumbing
- applying relevant WHS precautions, including the use of PPE and MSDS.
-

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- fluid power principles
- plumbing identification marking
- mechanical, hydraulic and pneumatic aircraft systems, their components and maintenance requirements
- the relative advantages and disadvantages of mechanical, hydraulic and pneumatic systems
- hydraulic fluid types, characteristics and handling precautions
- aircraft fuel storage and distribution systems and components thereof
- aircraft fuels, their characteristics and handling precautions
- WHS precautions relating to aircraft systems and their operation.

Assessment Conditions

- This unit may be assessed off the job in a training environment equipped to provide exposure to the range of system types and provide for the layout, set-up and operation of basic hydraulic systems. The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, teacher's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

MEA341 Apply basic aircraft design characteristics

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of basic knowledge of aerodynamic shape and structural methods for aeroplanes and rotary wing aircraft.

The unit is part of Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aeronautical engineering

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1. Research and evaluate aeroplane aerodynamic shape	1.1	Common wing plan forms are identified and relative advantages and disadvantages are evaluated
	1.2	Common wing configurations are identified and

- relative advantages and disadvantages are identified
- 1.3 Aerofoil characteristics are discussed in terms of aircraft performance
 - 1.4 Aeroplane stability and control is discussed in terms of aerodynamic design
 - 1.5 Types of primary and secondary flight control surfaces are identified and control balancing is discussed
 - 1.6 Types of lift augmentation device are identified and compared
 - 1.7 Factors that affect an aircraft in subsonic and high speed flight are identified
2. Research and evaluate rotary wing aerodynamic design
 - 2.1 Common rotor configurations are identified and discuss their aerodynamic characteristics discussed
 - 2.2 Rotary wing aircraft control and stability are discussed
3. Research and evaluate basic aircraft structural design
 - 3.1 The loads acting on an aircraft structure are identified
 - 3.2 The methods of construction of airframes and power plant support structures are identified and compared
 - 3.3 The materials of construction commonly used in aircraft structures are identified and their relative advantages and disadvantages discussed
 - 3.4 Fabrication methods commonly used in aircraft structure are identified and discussed
 - 3.5 Maintenance requirements for aircraft structure are identified
4. Research and evaluate basic landing gear design and construction
 - 4.1 The configurations of landing gear are identified and discussed in terms of relative advantages and disadvantages
 - 4.2 The relative benefits of fixed and retractable landing gear are identified and discussed
 - 4.3 Construction materials used in landing gear components are identified and discussed

5. Apply basic aircraft design characteristics
- 5.1 Given required aircraft use and performance characteristics an appropriate aerodynamic shape is determined
 - 5.2 An appropriate method of construction, materials of construction and fabrication method are proposed
 - 5.3 An appropriate landing gear configuration is proposed

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Common wing plan forms include:

- Straight
- Tapered
- Swept
- Delta
- Variable geometry
- Canard

Common wing configurations include:

- Mid-wing
- Low wing
- High wing

Common rotor configurations include:

- Main rotor and tail rotor
- Two main rotors
- Two blade main rotor
- Multiple blade main rotor
- Hinged main rotor blades
- Rigid rotor

Configurations of landing gear include:

- Tricycle
- Tail wheel
- Tail skid
- Floats
- Skis

- Helicopter skids
- Helicopter wheels and brakes

Unit Mapping Information

Assessment Requirements for MEA341 Apply basic aircraft design characteristics

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- identifying the effects of aerodynamic shape and types of flight controls on aircraft performance, stability and control
- identifying the influence of rotor design on rotary wing aircraft stability and control
- identifying the loads acting on aircraft structure, types of structure and related maintenance requirements
- identifying the types and designs of landing gear and their applications.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- theory of flight, including rotary wing
- loads acting on aircraft structures and structural fatigue, including rotary wing
- aircraft design characteristics, including rotary wing
- types of aircraft structure
- methods of aircraft construction
- materials of construction
- structural maintenance requirements
- use of non-destructive testing (NDT) in structural maintenance
- basic landing gear design characteristics
- use of ultra-high strength steels in landing gear design and related maintenance requirements.

Assessment Conditions

- This unit may be assessed off the job in a training environment equipped to provide exposure to the relevant aircraft design characteristics and to theory of flight.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.

- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, teacher's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

ME A342 Apply basic aircraft power plant design characteristics

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of basic knowledge of propulsion and power plant selection for aeroplanes and rotary wing aircraft, piston engines and propellers/rotors, turbo prop, gas turbines and gas turbine/rotor.

The unit is part of Diploma and Advanced Diploma training pathways. It is used in workplaces that operate under the airworthiness regulatory systems of the Australian Defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

ME A101	Interpret work health and safety practices in aviation maintenance
ME A107	Interpret and use aviation maintenance industry manuals and specifications
ME A109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aeronautical engineering

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.	Research and evaluate the types of aeroplane and rotary wing	1.1	The types of aeroplane and rotary wing aircraft power plant are identified and compared in terms of relative advantages and disadvantages
----	--	-----	---

aircraft power plant and their relative advantages and disadvantages	1.2	Types of propeller are identified and compared in terms of relative advantages and disadvantages
	1.3	Turbojet and turbofan performance is compared in terms of relative advantages and disadvantages
	1.4	Maintenance requirements for aircraft power plants are identified
2. Apply basic power plant and propulsion system selection processes	2.1	Given required aeroplane use and performance characteristics an appropriate type of power plant is determined
	2.2	An appropriate type of propulsion system is selected
	2.3	Given required rotary wing aircraft use and performance characteristics an appropriate type of power plant is determined

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Types of aeroplane and rotary wing aircraft power plant include:

- Piston engine (petrol or diesel)
- Rotary
- Turboprop or gas turbine and rotor
- Turbofan
- Turbojet

Types of propellers include:

- Fixed pitch
- Adjustable pitch
- Constant speed
- Contra-rotating
- Tractor
- Pusher

Unit Mapping Information

Assessment Requirements for MEA342 Apply basic aircraft power plant design characteristics

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- identifying the different types of aircraft power plant and their relative advantages and applications
- identifying power plant maintenance and monitoring requirements
- identifying different types of propellers and their applications
- selecting power plants for aeroplanes and rotary wing aircraft given the applicable performance characteristics.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- basic power plant characteristics
- basic propeller theory and characteristics
- use of non-destructive testing (NDT) in power plant maintenance
- power plant maintenance requirements including the use of engine condition monitoring.

Assessment Conditions

- This unit may be assessed off the job in a training environment equipped to provide exposure to the relevant aircraft design characteristics and to theory of flight.
- The candidate must have access to all tools, equipment, materials and documentation required and must be permitted to refer to any relevant workplace procedures, product and manufacturing specifications, codes, standards, manuals and reference materials. The assessment environment should not disadvantage the candidate.
- Assessors must be satisfied that the candidate can competently and consistently perform all elements of the unit as specified by the criteria, including required knowledge, and be capable of applying the competency in new and different situations and contexts.
- Assessors should gather a range of evidence that is valid, sufficient, current and authentic. Evidence can be gathered through a variety of ways including direct observation, teacher's reports, project work, samples and questioning. Questioning techniques should not require language, literacy and numeracy skills beyond those required in this unit of competency.

- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).

ME A343 Remove and install avionic system components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of maintenance documentation/publications in the removal, installation and task certification of avionic system components of fixed and rotary wing aircraft during the performance of scheduled or unscheduled maintenance where system serviceability can be established by a simple self-test facility, other on-board test systems/equipment or by simple ramp test equipment. Maintenance may be performed individually or as part of a team.

The unit is part of the B1 maintenance certification licensing pathway under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

ME A227 Test and troubleshoot aircraft electrical systems and components

OR

ME A211 Inspect, test and troubleshoot advanced aircraft electrical systems and components

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|-------------------------------------|--|
| 1. Remove avionic system components | 1.1 System is rendered safe and prepared in accordance with the applicable maintenance manual and isolation tags |
|-------------------------------------|--|

- are fitted, where necessary, to ensure personnel safety
- 1.2 Avionic component removal is carried out in accordance with the applicable maintenance manual while observing all relevant work health and safety (WHS) requirements
 - 1.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 1.4 Removed components are tagged and packaged in accordance with specified procedures
2. Install avionic system components and verify system serviceability
 - 2.1 Avionic components to be installed are checked to confirm correct part numbers, modification status, serviceability and shelf life
 - 2.2 Installation of avionic components is performed in accordance with the applicable maintenance manual and regulatory requirements while observing all relevant WHS requirements
 - 2.3 System is reinstated to correct operational condition and is tested for serviceability
 - 2.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures and regulatory requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Procedures and requirements include:

Avionic components

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise.
- Components/line replaceable units (LRUs) from

include:

electronic instrument systems

- Components/LRUs from engine indication systems
- Communication system components
- Navigation system components
- Software updates to avionic systems where serviceability can be determined by a simple test

Tested for serviceability includes:

- Confirming system serviceability through the operation of built-in test equipment or any other on-board system that can confirm correct operation
- Using only off-aircraft test equipment that provides a simple go/no go decision regarding system serviceability

Unit Mapping Information

Release 1 – equivalent to MEA343B Remove and install avionic system components

Links

Companion Volume implementation guides are found in VETNet -
<https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA343 Remove and install avionic system components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- locating and identifying avionic components that are part of instrument and radio systems
- determining that component and system serviceability can be confirmed by a simple self-test facility, other on-board test systems/equipment or by simple ramp test equipment requiring a simple go/no go decision
- applying relevant WHS practices
- applying component attachment methods
- connecting hardware and plugs
- handling precautions for electrostatic sensitive devices
- using approved maintenance documentation and aircraft publications relating to avionic systems
- using built-in test equipment to confirm system serviceability (this may involve the operation of specific built-in test equipment, on-board maintenance systems and Integrated Modular Avionic modules).

It is essential that cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with, as well as work practices associated with electrostatic sensitive devices.

Evidence of transferability of skills and knowledge related to removal and installation is essential. This is to be demonstrated by application across a range of aircraft avionic system components as listed in the Assessment Conditions.

Knowledge Evidence

- Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:
 - electronic fundamentals
 - digital techniques relating to electronic instrument systems
 - engine indication systems
 - the operation of built-in test equipment
 - on-board maintenance systems

- Integrated Modular Avionics and the interface with hydraulic, fuel and pneumatic systems.

Assessment Conditions

- Competency should be assessed in the workplace or simulated workplace using tools and equipment specified in maintenance manuals. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of the attachment methods, connection of hardware, and system test requirements as they relate to the work must be demonstrated before undertaking any action.
- The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a representative range of avionic components, as listed in the Range of Conditions:
 - components/LRUs from electronic instrument systems
 - components/LRUs from engine indication systems
 - communication system components
 - navigation system components
 - software updates to avionic systems where serviceability can be determined by a simple test.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

Links

Companion Volume implementation guides are found in VETNet -

ME A344 Remove and install aircraft components

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and standard trade practices in the removal and installation of fixed and rotary wing aircraft components during scheduled or unscheduled maintenance, including hydro-mechanical and mechanical components, and emergency equipment that is within the privileges of the A Licence.

This is one of the units required for the granting of the chosen maintenance certification A Licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

ME A101	Interpret work health and safety practices in aviation maintenance
ME A103	Plan and organise aviation maintenance work activity
ME A105	Apply quality standards applicable to aviation maintenance processes
ME A107	Interpret and use aviation maintenance industry manuals and specifications
ME A108	Complete aviation maintenance industry documentation
ME A109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Remove landing gear components | 1.1 The aircraft is jacked as specified in the maintenance manual for landing gear component removal |
| | 1.2 Removal of components is carried out in accordance with the applicable maintenance publications while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.3 Required maintenance documentation is accurately completed and correctly processed |
| | 1.4 Removed components are tagged, sealed and packaged in accordance with standard organisational procedures |
| 2. Remove hydro-mechanical components | 2.1 Hydro-mechanical system is rendered safe and prepared in accordance with the applicable maintenance publication, including fitment of isolation tags, where necessary, to ensure personal safety |
| | 2.2 Removal of hydro-mechanical components is carried out in accordance with the applicable maintenance publications while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 2.3 Required maintenance documentation is accurately completed and correctly processed |
| | 2.4 Removed components are tagged, sealed and packaged in accordance with standard organisational procedures |
| 3. Remove mechanical components/emergency equipment | 3.1 Applicable safety precautions are identified and observed for the removal and handling of components |

- 3.2 Removal of mechanical components/emergency equipment is carried out in accordance with the applicable maintenance publications while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 3.3 Required maintenance documentation is accurately completed and correctly processed
 - 3.4 Removed components and/or items of emergency equipment are tagged, sealed and packaged in accordance with standard organisational procedures
4. Install landing gear components
 - 4.1 Components to be installed are checked to confirm correct part numbers, serviceability and modification status
 - 4.2 Component installation is carried out in accordance with applicable maintenance publications while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 4.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
5. Install hydro-mechanical components
 - 5.1 Components to be installed are checked to confirm correct part numbers, serviceability and modification status
 - 5.2 Component installation is carried out in accordance with applicable maintenance publications while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 5.3 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
6. Install mechanical components/emergency equipment
 - 6.1 Components to be installed are checked to confirm correct part numbers, serviceability and modification status
 - 6.2 Component installation is carried out in accordance with applicable maintenance publications while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 6.3 Required maintenance documentation is completed

and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Landing gear components include:

- Main and nose wheel assemblies
- Brake units

Hydro-mechanical components include:

- Toilet system components (excluding gate valves)
- Windscreen wiper blades

Mechanical components/emergency equipment includes:

- Passenger and crew seats, seat belts and harnesses
- Internal doors (excluding any doors that form part of the pressure hull)
- Trim panels, linings, cabin equipment and consoles
- Applicable emergency equipment, such as life jackets, rafts, location transmitters/beacons

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA344A Remove and install aircraft components

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA344 Remove and install aircraft components

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS practices, including the use of MSDS and PPE
- jacking of aircraft for landing gear component removal
- using hand skills and tools to perform component removal and installation tasks
- correctly installing and securing of aircraft hardware
- inspecting and correctly installing of bearings
- safe handling of heavy components
- using maintenance publications to prepare the aircraft for component removal and installation and correct interpretation of removal and installation instructions
- applying standard procedures.

The underlying skills inherent in this unit should be transferable into other units that require similar techniques. It is essential that system cleanliness requirements and safety precautions applicable to the system being maintained are fully observed, understood and complied with.

This shall be demonstrated through application across a number of aircraft systems or aircraft types, but must cover a sufficient range of tasks to demonstrate familiarity with attachment methods, connection hardware and couplings peculiar to each type of system, and of safe handling of heavy components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- how to locate and correctly remove and install components
- how to locate and correctly remove and install items of emergency equipment
- WHS procedures relating to component removal and installation and handling of heavy components
- How to obtain PPE
- How to obtain MSDS

- relevant maintenance publications
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using procedures, tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- An understanding of system operation as it relates to the work must be demonstrated before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of CASA and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under supervision without intervention on at least one (1) component from each of the following groups:
 - main and nose wheel assemblies
 - brake units
 - toilet system components (excluding gate valves)
 - windscreen wiper blades
 - passenger and crew seats, seat belts and harnesses
 - internal doors (excluding any doors that form part of the pressure hull)
 - trim panels, linings, cabin equipment and consoles
 - applicable emergency equipment, such as life jackets, rafts, location transmitters/beacons.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA345 Perform scheduled line maintenance activities on gas turbine engine fixed wing aircraft

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and standard trade practices in the performance of scheduled servicings up to the Weekly Check or equivalent, pre and post-flight servicing activities and the application of aircraft ground handling procedures on gas turbine engine fixed wing aircraft.

The unit is one of those required for the granting of the chosen maintenance certification A1 Licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Prepare for flight | 1.1 Aircraft is positioned as required |
| | 1.2 Ground locks, aircraft support and safety devices and covers are removed and stowed in accordance with maintenance documentation |
| | 1.3 Aircraft tie-down devices are removed and stowed/stored |
| 2. Inspect aircraft and systems | 2.1 Preparation of the aircraft and systems is appropriate to allow for proper inspection |
| | 2.2 Aircraft and systems are visually or physically checked for external signs of defects in accordance with applicable maintenance documentation while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| 3. Replenish aircraft systems | 3.1 Fluid level checks and replenishments are carried out in accordance with maintenance documentation requirements |
| | 3.2 Maintenance of gaseous levels (oxygen, nitrogen and compressed air) is carried out in accordance with maintenance documentation requirements while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 3.3 Role equipment/components requiring pre-flight replacement are changed as required by maintenance documentation |
| | 3.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 4. Perform scheduled line maintenance checks | 4.1 Inspection requirements are determined from maintenance documentation |
| | 4.2 Aircraft structure and systems are visually inspected for |

external signs of defects in accordance with applicable maintenance documentation while observing all relevant WHS requirements, including the use of MSDS and items of PPE

- 4.3 Defects are recorded and reported in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Maintenance activities include, as applicable to the enterprise operating and maintenance system:

- Preparation for flight following maintenance
- Before flight servicing
- After flight servicing
- Turn around servicing
- Scheduled line maintenance activities up to the level of a Weekly Check or specified equivalent

Maintenance documentation includes:

- Maintenance manuals
- Servicing schedules
- Applicable airworthiness regulations
- Aircraft maintenance program

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA345A Perform scheduled line maintenance activities on gas turbine engine fixed wing aircraft

Assessment Requirements for MEA345 Perform scheduled line maintenance activities on gas turbine engine fixed wing aircraft

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- ground handling of aircraft
- using hand skills and tools to perform flight servicing activities
- correctly installing and securing of aircraft hardware
- locating, using and correctly stowing of aircraft safety and security equipment, including ground locks, covers, support and safety devices and tie-down devices
- applying ground power (where applicable)
- inspecting structure for damage and deterioration
- recognising external signs of component damage, leakage and security in aircraft systems
- recognising visual signs of damage, leakage and security with regard to engines and propellers (where applicable)
- refuelling the aircraft with the correct type, quantity and distribution of fuel
- checking and replenishing fluid level using the correct fluids
- recharging of gaseous levels using the correct support equipment and procedures
- lubricating components
- checking fire protection systems (where applicable) for correct gas charge levels
- replacing role equipment requiring pre-flight replacement
- using maintenance data and manuals to determine flight servicing requirements and procedures
- applying standard procedures
- observing all relevant WHS procedures, including the use of PPE and MSDS.

It is essential that the specific aspects of the aircraft flight servicing or scheduled line maintenance task are checked to ensure quality and safety standards are fully observed, understood and complied with. Safety precautions applicable to the system being maintained are to be fully observed. An understanding of system operation as it relates to the work must be demonstrated before undertaking any action.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- aircraft structural concepts and structure to the extent required to be able to recognise typical types of structural damage and deterioration during flight servicing activities and scheduled inspections up to the level of a Weekly Check or equivalent
- system layout, operation and typical external signs of faults to the extent required to perform flight servicing and scheduled inspections up to the level of a Weekly Check or equivalent
- types and characteristics of fuels and fuel additives
- types and characteristics of lubricants
- types and characteristics of hydraulic fluids
- WHS procedures relating to flight servicing activities, including how to obtain PPE and MSDS
- basic theory of flight relating to fixed wing aircraft, including stability and control
- the function of on-board maintenance systems
- gas turbine engine and propeller basic theory, installation and operation
- relevant principles of mathematics and physics.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using procedures, tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- Evidence of knowledge of system operation, recognition of defects and completion of documentation, the relationship of individual components and the links with other systems will be necessary to the extent required for completion of flight servicing and scheduled line maintenance task before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under supervision but without intervention on the following flight servicings and scheduled line maintenance tasks that are applicable to the enterprise operating and maintenance system:
 - preparation for flight following maintenance
 - before flight servicing
 - after flight servicing
 - turn around servicing

- scheduled line maintenance activities up to the level of a Weekly Check or specified equivalent.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA346 Perform scheduled line maintenance activities on gas turbine engine rotary wing aircraft

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and standard trade practices in the performance of scheduled servicings up to the Weekly Check or equivalent, pre and post-flight servicing activities and the application of aircraft ground handling procedures on gas turbine engine rotary wing aircraft.

The unit is one of those required for the grant of the chosen maintenance certification A3 Licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation

MEA348 Perform scheduled line maintenance activities on piston engine rotary wing aircraft

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and standard trade practices in the performance of scheduled servicings up to the Weekly Check or equivalent, pre and post-flight servicing activities and the application of aircraft ground handling procedures on piston engine rotary wing aircraft.

The unit is one of those required for the grant of the chosen maintenance certification A4 Licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |

| | | 2.2 | Aircraft and systems are visually or physically checked for external signs of defects in accordance with applicable maintenance documentation while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| 3. | Replenish aircraft systems | 3.1 | Fluid level checks and replenishments are carried out in accordance with maintenance documentation requirements |
| | | 3.2 | Maintenance of gaseous levels (oxygen, nitrogen and compressed air) is carried out in accordance with maintenance documentation requirements while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | | 3.3 | Role equipment/components requiring pre-flight replacement are changed as required by maintenance documentation |
| | | 3.4 | Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 4. | Perform scheduled line maintenance checks | 4.1 | Inspection requirements are determined from maintenance documentation |
| | | 4.2 | Aircraft structure and systems are visually inspected for external signs of defects in accordance with applicable |

maintenance documentation while observing all relevant WHS requirements, including the use of MSDS and items of PPE

- 4.3 Defects are recorded and reported in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Maintenance activities include, as applicable to the enterprise operating and maintenance system:**
- Preparation for flight following maintenance
 - Before flight servicing
 - After flight servicing
 - Turn around servicing
 - Scheduled line maintenance activities up to the level of a Weekly Check or specified equivalent
- Maintenance documentation includes:**
- Maintenance manuals
 - Servicing schedules
 - Applicable airworthiness regulations
 - Aircraft maintenance program
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA348A Perform scheduled line maintenance activities on piston engine rotary wing aircraft

Assessment Requirements for MEA348 Perform scheduled line maintenance activities on piston engine rotary wing aircraft

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- ground handling of aircraft
- using hand skills and tools to perform flight servicing activities
- correctly installing and securing of aircraft hardware
- locating, using and correctly stowing of aircraft safety and security equipment (includes ground locks, covers, support and safety devices and tie-down devices)
- applying ground power (where applicable)
- inspecting structure for damage and deterioration
- recognising of external signs of component damage, leakage and security in aircraft systems
- recognising of visual signs of damage, leakage and security with regard to engines, transmissions and rotors
- refuelling the aircraft with the correct type, quantity and distribution of fuel
- checking and replenishing fluid level using the correct fluids
- recharging of gaseous levels using the correct support equipment and procedures
- lubricating components
- checking fire protection systems (where applicable) for correct gas charge levels
- replacing role equipment requiring pre-flight replacement
- using maintenance data and manuals to determine flight servicing requirements and procedures
- applying standard procedures
- observing all relevant WHS procedures including the use of PPE and MSDS.

It is essential that the specific aspects of the aircraft flight servicing or scheduled line maintenance task are checked to ensure quality and safety standards are fully observed, understood and complied with. Safety precautions applicable to the system being maintained are to be fully observed. An understanding of system operation as it relates to the work must be demonstrated before undertaking any action.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- standard trade practices relating to tool usage and installation/securing of aircraft hardware
- aircraft structural concepts and structure to the extent required to be able to recognise typical types of structural damage and deterioration during flight servicing activities and scheduled inspections up to the level of a Weekly Check or equivalent
- system layout, operation and typical external signs of faults to the extent required to perform flight servicing and scheduled inspections up to the level of a Weekly Check or equivalent
- the function of on-board maintenance systems
- types and characteristics of fuels and fuel additives
- types and characteristics of lubricants
- types and characteristics of hydraulic fluids
- WHS procedures relating to flight servicing activities, including how to obtain PPE and MSDS
- basic theory of flight relating to rotary wing aircraft, including stability and control
- piston engine basic theory, installation and operation
- factors influencing piston engine performance
- engine transmission and rotor basic theory, installation and operation
- relevant principles of mathematics and physics.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using procedures, tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools, test and ground support equipment found in most routine situations would be used where appropriate.
- Evidence of knowledge of system operation, recognition of defects and completion of documentation, the relationship of individual components and the links with other systems will be necessary to the extent required for completion of flight servicing and scheduled line maintenance task before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of CASA and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under supervision but without intervention on the following flight servicings and scheduled line maintenance tasks that are applicable to the enterprise operating and maintenance system:
 - preparation for flight following maintenance
 - before flight servicing

- after flight servicing
- turn around servicing
- scheduled line maintenance activities up to the level of a Weekly Check or specified equivalent.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA351 Maintain airframe systems of basic light fixed wing aircraft

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot, and replace components of airframe systems of fixed wing aircraft that have fixed undercarriage and a normally aspirated engine driving a fixed pitch propeller, or a small gas turbine engine. This may be done during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activities
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|--|-----|---|
| 1. | Inspect basic light fixed wing airframe systems | 1.1 | Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | | 1.2 | Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | | 1.3 | Airframe system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | | 1.4 | Defects are correctly identified and reported |
| 2. | Test/adjust basic light fixed wing airframe systems and components | 2.1 | Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | | 2.2 | Airframe system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | | 2.3 | System adjustment/rigging is performed in accordance with maintenance manual |
| 3. | Troubleshoot basic light fixed wing airframe systems | 3.1 | Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | | 3.2 | Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | | 3.3 | Specialist advice is obtained, where required, to assist |

- with the troubleshooting process
- 3.4 Airframe system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures
 - 3.5 Rectification requirements are determined
4. Remove and install basic light fixed wing airframe system components
- 4.1 System is rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
 - 4.2 Airframe system component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 4.3 Required maintenance documentation is accurately completed and correctly processed
 - 4.4 Removed components are tagged, sealed and packaged in accordance with specified procedures
 - 4.5 Components to be installed are checked to confirm correct part numbers, serviceability and modification status
 - 4.6 Mass balance of control surfaces to be installed is checked in accordance with the applicable maintenance manual, if required
 - 4.7 Installation is carried out in accordance with the applicable maintenance manual
 - 4.8 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Maintenance documentation includes:**
- Servicing schedules
 - Maintenance manuals
- Airframe systems include:**
- Flight control systems
 - Fixed undercarriage shock absorbers
 - Master/slave cylinder brake systems
 - Fuel systems
 - Cabin heating systems
- Airframe system components include:**
- Ailerons, elevators, rudders, trim tabs, flaps and slats
 - Flight control wheels or sticks, cables, pulleys, guides, fairleads, bellcranks, rods, torque tubes, chains, sprockets, trim wheels or handles and rudder pedals or bars
 - Fixed undercarriage hydraulic and rubber shock absorbers
 - Wheels and brake units
 - Brake master cylinders and rigid or flexible plumbing
 - Rigid or flexible fuel tanks, selector/shutoff valves and rigid or flexible plumbing
 - Cabin heater ducting and control valves
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA351A Maintain airframe systems of basic light fixed wing aircraft

Links

Companion Volume implementation guides are found in VETNet - <https://vetnet.education.gov.au/Pages/TrainingDocs.aspx?q=ce216c9c-04d5-4b3b-9bcf-4e81d0950371>

Assessment Requirements for MEA351 Maintain airframe systems of basic light fixed wing aircraft

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills, tools and test equipment in the testing, adjustment and troubleshooting of airframe systems and components, including airframe system component removal and installation
- recognising system and component defects/external damage, correct installation and security for the range of airframe systems listed in the Range of Conditions
- removing, installing and rigging of flight controls
- checking flight control mass balance
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process and for component removal and installation
- applying standard procedures
- observing all relevant WHS procedures, including the use of PPE and MSDS.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with airframe systems and components of basic light fixed wing aircraft. It is essential that relevant procedures, cleanliness requirements and safety precautions are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This shall be demonstrated through application across a range of airframe systems and components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS precautions relevant to airframe system maintenance, including the use of PPE and MSDS
- standard trade practices relating to tool and test/rigging equipment usage and installation/securing of system components

- flight control system layout and operation
- theory of flight:
 - airflow
 - conditions of flight
 - lift and forces
 - drag
 - wings, tailplane and vertical stabiliser
 - lift augmentation (flaps, slats and slots)
 - aircraft control surfaces and their function (elevator, ailerons, rudder, elevons and trim tabs)
 - flight control balancing and flutter
 - stability and control and flight control rigging
- system layout and operation:
 - cockpit controls
 - cables and cable tensioning
 - pulleys and fairleads
 - bellcranks
 - levers
 - control surface horns
 - screwjacks
 - push/pull rods
- mechanical flight control system maintenance procedures and troubleshooting
- fixed undercarriage and shock absorber systems:
 - undercarriage configurations and types (tail wheel, tricycle and bicycle)
 - relative advantages of undercarriage configurations
 - steering systems
 - types of shock absorber (springs, leaf, coil, spring tube, rubber disc, bungee and oleo)
 - wheels and tyres
 - axles and wheel bearings
 - wheel spats
 - fixed undercarriage maintenance procedures and troubleshooting
- small aircraft brake systems:
 - types of brake system (mechanical and hydraulic)
 - master/slave cylinder hydraulic brake system operation
 - hydraulic fluids and seals
 - rigid and flexible plumbing
 - brake pads and shoes
 - brake discs and drums/linings
 - brake system maintenance procedures and troubleshooting
- cabin heater system layout and operation:

- heat source (muff heaters)
- ducting for heating and demisting
- valves and linkages
- fan
- cabin heating system maintenance procedures and troubleshooting
- fuel system layout and operation:
 - fuel tank types and location
 - selector valves and linkages
 - drain valves
 - rigid and flexible plumbing
 - fuel filters
 - boost pumps
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision as follows:
 - at least one (1) of each system:
 - flight control systems
 - fixed undercarriage shock absorbers
 - master/slave cylinder brake systems
 - fuel systems
 - cabin heating systems
 - a representative range of components from each of the following groups:
 - ailerons, elevators, rudders, trim tabs, flaps and slats
 - flight control wheels or sticks, cables, pulleys, guides, fairleads, bellcranks, rods, torque tubes, chains, sprockets, trim wheels or handles and rudder pedals or bars
 - fixed undercarriage hydraulic and rubber shock absorbers
 - wheels and brake units

- brake master cylinders and rigid or flexible plumbing
- rigid or flexible fuel tanks, selector/shutoff valves and rigid or flexible plumbing
- cabin heater ducting and control valves.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA352 Maintain basic rotary wing aircraft systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test and troubleshoot, and replace components of rotor, rotor control systems and airframe systems of basic rotary wing aircraft during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include rotary wing aircraft that have mechanical control systems, either skids or floats and a normally aspirated engine.

This unit of competency is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activities
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|--|-----|--|
| 1. | Inspect rotor and rotor control systems and components | 1.1 | Isolation and warning signs are fitted/installed to the system or related systems and the aircraft configured for safe system inspection and operation in accordance with relevant aircraft publications/maintenance regulations orders and standards and practices |
| | | 1.2 | Rotor and rotor control system is visually or physically checked/inspected for external signs of defects in accordance with relevant aircraft publications maintenance regulations/orders and standards and practices while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | | 1.3 | Defects are identified and recorded in accordance with standard enterprise procedures |
| 2. | Inspect basic rotary wing airframe systems | 2.1 | Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | | 2.2 | Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | | 2.3 | Airframe system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | | 2.4 | Defects are correctly identified and reported |
| 3. | Ground test rotor and rotor control systems | 3.1 | Aircraft and system are prepared in accordance with relevant aircraft publications/maintenance regulations orders and standards and practices for the operation of |

- engine and rotor system
- 3.2 Rotor and rotor control system are functionally tested in accordance with relevant aircraft publications maintenance regulations/orders and standards and practices for evidence of malfunction
 - 3.3 System calibration or adjustments are performed in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
4. Test/adjust basic rotary wing airframe systems and components
 - 4.1 Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation
 - 4.2 Airframe system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction
 - 4.3 System adjustment is performed in accordance with maintenance manual
5. Troubleshoot rotor and rotor control systems
 - 5.1 Available information from aircraft maintenance documentation, inspection and test results is used to assist in fault determination
 - 5.2 Relevant aircraft publication fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level
 - 5.3 Specialist advice is obtained to assist with the troubleshooting process
 - 5.4 Rotor and rotor control system faults are located and the causes of the faults are clearly identified and recorded in aircraft maintenance documentation in accordance with standard enterprise procedures
 - 5.5 Fault rectification requirements are determined
6. Troubleshoot basic rotary wing airframe systems
 - 6.1 Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination
 - 6.2 Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting

- 6.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
 - 6.4 Airframe system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures
 - 6.5 Rectification requirements are determined
7. Remove and install rotary wing rotor and rotor system components
- 7.1 System is rendered safe and prepared in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices, and isolation and warning signs are installed/fitted to ensure personnel safety
 - 7.2 Rotor and rotor system component removal is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 7.3 Required aircraft maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 7.4 Removed components are labelled, sealed and packaged in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 - 7.5 Rotor or rotor system component to be installed is checked to confirm correct part or model numbers, modification status and serviceability
 - 7.6 Mass balance of rotor blades/head is checked in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 - 7.7 Installation is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 - 7.8 Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage

8. Remove and install rotor control system components
- 8.1 System is rendered safe and prepared in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices, and isolation and warning signs are installed/fitted to ensure personnel safety
 - 8.2 Rotary wing flight control system component removal is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 8.3 Required aircraft maintenance documentation is completed and processed in accordance with standard enterprise procedures
 - 8.4 Removed components are labelled, sealed and packaged in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 - 8.5 Rotary wing flight control system components to be installed are checked to confirm correct part or model numbers, modification status and serviceability
 - 8.6 Installation is carried out in accordance with relevant aircraft publications/maintenance regulations/orders and standards and practices
 - 8.7 Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage
 - 8.8 Required aircraft maintenance documentation is completed and processed in accordance with standard enterprise procedures
9. Remove and install basic rotary wing airframe system components
- 9.1 System is rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
 - 9.2 Airframe system component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 9.3 Required maintenance documentation is accurately

- completed and correctly processed
- 9.4 Removed components are tagged, sealed and packaged in accordance with specified procedures
 - 9.5 Components to be installed are checked to confirm correct part numbers, serviceability and modification status
 - 9.6 Mass balance of control surfaces to be installed is checked in accordance with the applicable maintenance manual, if required
 - 9.7 Installation is carried out in accordance with the applicable maintenance manual
 - 9.8 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Rotor and rotor control system components include:

- Main rotor blades and tail rotor blades
- Rotor heads, swash plates and tail rotor pitch control assemblies
- Mechanical flight control components (collective and cyclic pitch levers, rudder pedals, cables, pulleys, guides, fairleads, bellcranks, rods, torque tubes, chains and sprockets)
- Main rotor, intermediate or tail rotor gearboxes
- Drive shafts and couplings
- Must be performed by a qualified pilot

Engine and rotor system operation:

Airframe systems include:

- Fuel systems

Airframe system components include:

- Cabin heating systems
- Rigid or flexible fuel tanks, selector/shutoff valves and rigid or flexible plumbing
- Cabin heater ducting and control valves

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA352 Maintain basic rotary wing aircraft systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills, tools and test equipment in the testing, adjustment and troubleshooting of:
 - rotary wing mechanical control systems
 - helicopter airframe systems and components, including rotors and rotor system
- recognising system and component defects/external damage, correct installation and security for the range of airframe systems listed in the Range of Conditions
- removing, installing and rigging of rotor systems and rotor/flight controls
- removing and installing the range of airframe components listed in the Range of Conditions
- checking rotor mass balance
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process and for component removal and installation
- applying standard procedures
- observing all relevant WHS procedures, including the use of PPE and MSDS.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with the, rotors, rotor control systems, airframe systems and components of basic rotary wing aircraft. It is essential that relevant procedures, cleanliness requirements and safety precautions are fully observed, understood and complied with.

Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This shall be demonstrated through application across a range of rotors, rotor control systems, airframe systems and components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS precautions relevant to airframe system maintenance, including the lifting and handling of heavy components and how to obtain PPE and MSDS
- standard trade practices relating to tool and test/rigging equipment usage and installation/securing of system components
- theory of flight:
 - airflow
 - conditions of flight
 - lift and forces
 - drag
- rotary flight principles:
 - terminology relating to:
 - aerofoils
 - main rotor blades
 - rotor discs
 - rotors (main and tail)
 - aerodynamic characteristics:
 - aerofoil design
 - forces
 - rotor thrust and power requirements
 - vortex ring
 - autorotation
 - helicopter stability
- helicopter dynamic components:
 - main rotors:
 - blades
 - heads
 - linkages
 - tail rotors
 - swash plates
 - transmissions and drive shafts
- helicopter structure and airframe systems:
 - structure and layout
 - engine and transmission
 - flight control system layout and operation
 - cabin heater system layout and operation
 - fuel system layout and operation
- helicopter maintenance procedures and troubleshooting

- relevant maintenance manuals
- relevant regulatory requirements and standard procedures, including requirements for engine and rotor system operation.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on groups listed in the Range of Conditions, as follows:
 - at least one (1) component from each of:
 - main rotor blades and tail rotor blades
 - rotor heads, swash plates and tail rotor pitch control assemblies
 - mechanical flight control components (collective and cyclic pitch levers, rudder pedals, cables, pulleys, guides, fairleads, bellcranks, rods, torque tubes, chains and sprockets)
 - main rotor, intermediate or tail rotor gearboxes
 - drive shafts and couplings
 - fuel systems
 - cabin heating systems
 - a representative range of components from:
 - rigid or flexible fuel tanks, selector/shutoff valves and rigid or flexible plumbing
 - cabin heater ducting and control valves.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified

MEA353 Maintain basic light aircraft engines and propellers

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, the use of maintenance publications, and knowledge of piston engine and system theory to inspect, test and troubleshoot, remove and install normally aspirated piston engines and engine system components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include normally aspirated piston engines of basic light fixed wing aircraft and basic rotary wing aircraft, and fixed pitch propellers.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activities
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|---|-----|--|
| 1. | Inspect piston engine system and components | 1.1 | Isolation tags already attached to the system or related systems are checked and aircraft/engine configured for safe system inspection and operation in accordance with applicable maintenance manual |
| | | 1.2 | Piston engine and components/systems are visually or physically checked for external and internal signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| 2. | Test piston engine | 2.1 | Aircraft and engine are correctly prepared in accordance with applicable maintenance manual |
| | | 2.2 | Assistance is provided with engine and/or system operation during prescribed test procedures to establish serviceability and correct function in accordance with applicable maintenance manual |
| 3. | Troubleshoot piston engine | 3.1 | Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | | 3.2 | Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | | 3.3 | Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | | 3.4 | Piston engine faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required |
| | | 3.5 | Fault rectification requirements are determined to assist |

- in planning the repair
4. Remove piston engine and engine system components
 - 4.1 Aircraft is prepared and supported and rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure the safety of personnel and freedom from damage during engine removal
 - 4.2 Removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 4.3 Engine is tagged and prepared for transport or storage in accordance with the specified procedures
 - 4.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
 5. Install piston engine and engine system components
 - 5.1 Engine to be installed is checked to confirm correct part or model numbers, modification status and serviceability
 - 5.2 Installation is carried out in accordance with the applicable maintenance manual
 - 5.3 Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage
 - 5.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
 6. Inspect and maintain fixed pitch propeller
 - 6.1 Engine is rendered safe for propeller inspection in accordance with maintenance manual or enterprise procedures
 - 6.2 Fixed pitch propeller is inspected for security, damage and deterioration in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 6.3 Metal propeller nicks and dents within damage limits are blended out in accordance with maintenance manual procedures

- | | |
|----------------------------------|---|
| 7. Remove fixed pitch propeller | 7.1 Engine is rendered safe and the aircraft is prepared for propeller removal in accordance with maintenance manual or enterprise procedures |
| | 7.2 Propeller is removed in accordance with maintenance manual procedures while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 7.3 Removed propeller is tagged and prepared for transport or storage in accordance with specified procedures |
| | 7.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 8. Install fixed pitch propeller | 8.1 Engine is rendered safe and the aircraft is prepared for propeller installation in accordance with maintenance manual or enterprise procedures |
| | 8.2 Propeller to be installed is checked to confirm correct part or number, modification status and serviceability |
| | 8.3 Installation is carried out in accordance with the applicable maintenance manual |
| | 8.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Piston engines and components/systems include:

- Normally aspirated engine (all types), main components and accessories/drives
- Control system

- Starter system
 - Fuel and air systems
 - Exhaust system
 - Oil system (if dry sump) (where applicable to the enterprise)
- Engine and/or system operation includes:**
- Testing of engines fitted to helicopters (where auxiliary drive is not available) shall be carried out through the applicant directing a pilot qualified on type
- Fixed pitch propellers:**
- Fixed pitch propeller may include a spinner and the propeller will be made from:
- metal
 - composite
 - wood
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA353A Maintain basic light aircraft engines and propellers

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA353 Maintain basic light aircraft engines and propellers

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the use of MSDS and PPE
- using relevant maintenance documentation and aircraft manuals
- recognising external and internal signs of defects in piston engines, components and system components visual/physical inspection
- assisting with testing of piston engine and engine system operation, be able to operate systems, monitor indications, record parameters and recognise correct function
- compiling engine condition monitoring records
- rigging and adjusting engine controls and systems
- using fault diagnosis guides and equivalent data to accurately and efficiently troubleshoot the causes of unserviceabilities in piston engines and engine systems, clearly record details and identify the required rectification actions
- correctly removing and installing piston engine, engine components and fixed pitch propellers, including spinners
- inspecting propellers for security, damage and deterioration
- blending out metal propeller nicks and dents that are within maintenance manual limits.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing, troubleshooting and removal and installation tasks (including the timely involvement of supervisor or other trades) associated with engines, engine systems and fixed pitch propellers. It is essential that system testing procedures take into account all safety precautions associated with piston engine system operation, and that awareness be demonstrated of dual inspection requirements associated with work on engine controls.

This shall be demonstrated through application across a number of engine systems or types and propellers made from different materials. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical. The application of testing procedures and functional rigging checks should also indicate knowledge of system operation.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS procedures associated with engine and propeller maintenance, including lifting and handling of heavy objects
- how to obtain MSDS
- use of PPE
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures
- fault diagnosis techniques
- piston engine and engine system layout and operation:
 - four stroke engine theory of operation and performance
 - cylinder configurations
 - construction (components and materials)
 - carburettors and air induction systems
 - fuel injection systems
 - fuels and their characteristics
 - ignition systems
 - lubricating systems and lubricants
 - cooling systems
 - exhaust systems
 - accessory drives and mounts
 - normally aspirated piston engine maintenance requirements and troubleshooting procedures
- system component operation, including electrical and instrument system interfaces:
 - magnetos and ignition harnesses
 - spark plugs
 - fuel pumps
 - fuel filters
 - oil pumps
 - oil filters
 - oil tanks
 - vacuum pumps
 - generators
 - starter motors
 - oil pressure gauges (direct reading)
 - temperature gauges (direct reading)
 - tachometers
 - manifold pressure gauges
 - maintenance requirements and troubleshooting procedures

- removal and installation procedures for piston engines and engine components:
 - removal procedures and handling
 - control linkages
 - electrical wiring
 - engine instrument connections
 - installation and rigging
 - ground running
 - system component removal, installation and system testing
- propellers, materials and damage and deterioration criteria:
 - fixed pitch propeller types, terminology and theory:
 - tractor/pusher
 - matching to engine and aircraft
 - leading edge/trailing edge
 - blade stations
 - forces acting on a propeller
 - propeller balance
 - materials and construction methods:
 - metal propeller metals, construction and surface protection
 - wooden propeller materials, construction and surface protection
 - composite propeller materials, construction and surface protection
 - damage and deterioration
 - methods of blending out of minor damage to metal propellers
- propeller removal and installation procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- Engine system operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to carry out rigging checks and troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of:
 - normally aspirated engine (all types), main components and accessories/drives

- control system
- starter system
- fuel and air systems
- exhaust system
- oil system (if dry sump) (may be omitted where not applicable to the enterprise)
- and on at least one (1) type of fixed pitch propeller.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA354 Maintain light aircraft pneumatic systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test, troubleshoot and replace components of light aircraft pneumatic systems during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include light aircraft that have pneumatic systems where the air source is other than gas turbine engine bleed air. Bleed-air supplied pneumatic systems are covered by units MEA303 Remove and install aircraft pneumatic system components and MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activities
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|---|-----|--|
| 1. | Inspect light aircraft pneumatic systems | 1.1 | Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | | 1.2 | Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | | 1.3 | Components of pneumatic systems are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | | 1.4 | Defects are correctly identified and reported |
| 2. | Test/adjust light aircraft pneumatic systems and components | 2.1 | Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | | 2.2 | Pneumatic system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | | 2.3 | System adjustment is performed in accordance with maintenance manual |
| 3. | Troubleshoot light aircraft pneumatic systems | 3.1 | Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | | 3.2 | Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate |

- troubleshooting to line replacement level
- 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process
 - 3.4 Pneumatic system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required, in accordance with standard enterprise procedures
 - 3.5 Rectification requirements are determined
4. Remove and install light aircraft pneumatic system components
- 4.1 System is rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
 - 4.2 Pneumatic system component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 4.3 Required maintenance documentation is accurately completed and correctly processed
 - 4.4 Removed components are tagged, sealed and packaged in accordance with specified procedures
 - 4.5 Components to be installed are checked to confirm correct part numbers, serviceability and modification status
 - 4.6 Installation is carried out in accordance with the applicable maintenance manual
 - 4.7 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect

performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- Pneumatic systems include:**
- De-icing systems, including de-icer boots on wings and tailplanes
- Pneumatic system components include:**
- Filters, valves, pumps, regulators and timers
 - Gauges (direct reading)
 - De-icer boots
 - Rigid and flexible pipelines, hoses and fittings
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA354 Maintain light aircraft pneumatic systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills, tools and test equipment in the testing, adjustment and troubleshooting of light aircraft pneumatic systems and components, including pneumatic system component removal and installation
- recognising pneumatic system and component defects/external damage, correct installation and security for the types of systems listed in the Range of Conditions
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process and for component removal and installation
- applying standard procedures
- observing of all relevant WHS procedures including the use of PPE and MSDS.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with light aircraft pneumatic systems and components. It is essential that relevant procedures, cleanliness requirements and safety precautions are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This shall be demonstrated through application across pneumatic systems and components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS precautions relevant to light aircraft pneumatic system maintenance and how to obtain PPE and MSDS
- standard trade practices relating to tool and test equipment usage and installation/securing of system components
- types of light aircraft pneumatic system and components thereof:

- vacuum
- positive pressure
- high pressure
- pneumatic system layout, operation and characteristics and system component operation and construction, including electrical and instrument system interfaces
- how to configure the aircraft for inspection, testing and troubleshooting of pneumatic systems and components
- pneumatic system maintenance requirements and troubleshooting
- component attachment methods
- connection hardware and couplings
- electrical circuit isolation and plug removal and installation
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

MEA355 Maintain light aircraft air cycle air conditioning systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test, troubleshoot and replace components of light aircraft air cycle air conditioning systems during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include unpressurised gas turbine engine-powered fixed and rotary wing light aircraft that have air cycle air conditioning systems. Where the aircraft has a pressurisation system the air conditioning and pressurisation systems are covered by MEA303 Remove and install aircraft pneumatic system components and MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA201	Remove and install miscellaneous aircraft electrical hardware and components
MEA246	Fabricate and/or repair aircraft electrical hardware or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|---|
| 1. Inspect light aircraft air cycle air conditioning system | <p>1.1 Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements</p> <p>1.2 Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual</p> <p>1.3 Air cycle air conditioning system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)</p> <p>1.4 Defects are correctly identified and reported</p> |

Assessment Requirements for MEA355 Maintain light aircraft air cycle air conditioning systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- using hand skills, tools and test equipment in the testing, adjustment and troubleshooting of light aircraft air cycle air conditioning systems and components, including system component removal and installation
- recognising air cycle air conditioning system and component defects/external damage, correct installation and security for the types of system components listed in the Range of Conditions
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process and for component removal and installation
- applying standard procedures
- observing all relevant WHS procedures including the use of PPE and MSDS.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with light aircraft air cycle air conditioning systems and components. It is essential that relevant procedures, cleanliness requirements and safety precautions are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This shall be demonstrated through application across air cycle air conditioning systems and components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS precautions relevant to light aircraft air cycle air conditioning system maintenance and how to obtain PPE and MSDS
- standard trade practices relating to tool and test equipment usage and installation/securing of system components
- air cycle air conditioning system:

- terminology
- layout
- operation, including component operation and construction
- electrical temperature control system components
- how to configure the aircraft for inspection, testing and troubleshooting of air cycle air conditioning systems and components
- air cycle air conditioning maintenance requirements and troubleshooting
- component attachment methods
- connection hardware and couplings
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures
- maintenance requirements and troubleshooting procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on an air cycle air conditioning system and on a representative range of the following components:
 - valves and regulators
 - heat exchangers, water separators and humidifiers
 - expansion turbines
 - rigid and flexible pipelines, hoses and fittings
 - ducting
 - temperature sensors, temperature controllers, and electrical control circuit wiring/components.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA356 Maintain light piston engine aircraft pressurisation systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of system/component knowledge and applicable maintenance publications and test equipment to inspect, test, troubleshoot and replace components of light piston engine aircraft pressurisation systems during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include all types of light fixed wing piston engine aircraft that have cabin pressurisation systems. Where aircraft types have pressurisation and air cycle air conditioning systems the applicable units are MEA208 Remove and install aircraft pressurisation control system components, MEA219 Inspect, test and troubleshoot aircraft pressurisation control systems and components, MEA303 Remove and install aircraft pneumatic system components and MEA310 Inspect, test and troubleshoot aircraft pneumatic systems and components.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA201	Remove and install miscellaneous aircraft electrical hardware and components
MEA246	Fabricate and/or repair aircraft electrical hardware or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | |
|---|-----|---|
| 1. Inspect light piston engine aircraft pressurisation system | 1.1 | Relevant maintenance documentation and modification status, including system defect reports, where relevant, are used to identify specific inspection requirements |
| | 1.2 | Isolation tags are checked and aircraft configured for safe system inspection and operation in accordance with the applicable maintenance manual |
| | 1.3 | Pressurisation system components are visually or physically checked for external signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.4 | Defects are correctly identified and reported |
| 2. Test/adjust light piston engine aircraft pressurisation systems and components | 2.1 | Aircraft and system are prepared in accordance with applicable maintenance manual for the application of power/system operation |
| | 2.2 | Pressurisation system is functionally tested in accordance with maintenance manual for evidence of serviceability or malfunction |
| | 2.3 | System adjustment is performed in accordance with maintenance manual |
| 3. Troubleshoot light piston engine aircraft pressurisation systems | 3.1 | Available information from maintenance documentation, inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 | Maintenance manual fault diagnosis guides and logic processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 | Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 | Pressurisation system faults are located and the causes of the faults are clearly identified and correctly recorded |

- in maintenance documentation, where required, in accordance with standard enterprise procedures
- 3.5 Rectification requirements are determined
4. Remove and install light piston engine aircraft pressurisation system components
- 4.1 System is rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure personnel safety
- 4.2 Pressurisation system component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
- 4.3 Required maintenance documentation is accurately completed and correctly processed
- 4.4 Removed components are tagged, sealed and packaged in accordance with specified procedures
- 4.5 Components to be installed are checked to confirm correct part numbers, serviceability and modification status
- 4.6 Installation is carried out in accordance with the applicable maintenance manual
- 4.7 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Pressurisation system components include:

- Pressure controllers
- Outflow valves
- Safety valves

Procedures and requirements include:

- Negative pressure relief valves
- Ducting
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Assessment Requirements for MEA356 Maintain light piston engine aircraft pressurisation systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- using hand skills, tools and test equipment in the testing, adjustment and troubleshooting of light piston engine aircraft pressurisation systems and components, including system component removal and installation
- recognising pressurisation system and component defects/external damage, correct installation and security for the types of system components listed in the Range of Conditions
- performing system functional tests and checks to isolate system faults and assess post-maintenance serviceability
- effectively using maintenance documentation and relevant fault diagnosis guides in the troubleshooting process and for component removal and installation
- applying standard procedures
- observing all relevant WHS procedures including the use of PPE and MSDS.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and troubleshooting applications (including the timely involvement of supervisors or other trades) associated with light piston engine aircraft pressurisation systems and components. It is essential that relevant procedures, cleanliness requirements and safety precautions are fully observed, understood and complied with. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This shall be demonstrated through application across pressurisation systems and components as listed in the Assessment Conditions.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS precautions relevant to light piston engine aircraft pressurisation system maintenance and how to obtain PPE and MSDS
- physiological aspects relating to high altitude flight:
 - human oxygen requirements and hypoxia

- human temperature requirements and hypothermia
- standard trade practices relating to tool and test equipment usage and installation/securing of system components
- sources of pressurised air (cabin supercharger, air pump or engine turbocharger)
- the relationship between cabin altitude and pressure differential and related structural limitations
- pressurisation system:
 - layout
 - operation and characteristics
 - system component operation and construction:
 - outflow valves
 - pressure controllers
 - safety valves
 - negative pressure relief valves
 - dump valves
 - ducting and outlets
 - electrical and instrument interfaces, including warning and cabin pressure indication systems
- interface with heating and air conditioning systems
- how to configure the aircraft for inspection, testing and troubleshooting of pressurisation systems and components
- pressurisation system maintenance requirements and troubleshooting
- component attachment methods
- connection hardware and couplings
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures
- maintenance requirements and troubleshooting procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures should clearly indicate knowledge of system operation, the relationship of individual components and the links with other systems (if applicable) within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of this unit of competency are being achieved under routine supervision on a pressurisation system and on a representative range of the following components:
 - pressure controllers
 - outflow valves
 - safety valves
 - negative pressure relief valves
 - ducting.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

ME A357 Inspect, test and repair aircraft fabric surfaces

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, knowledge of fabric covering systems and maintenance publications to inspect, test and repair aircraft fabric surfaces during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include aircraft and aircraft components that are covered with fabric.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

ME A101	Interpret work health and safety practices in aviation maintenance
ME A103	Plan and organise aviation maintenance work activities
ME A105	Apply quality standards applicable to aviation maintenance processes
ME A107	Interpret and use aviation maintenance industry manuals and specifications
ME A108	Complete aviation maintenance industry documentation
ME A109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Inspect/test aircraft fabric surfaces | 1.1 Relevant maintenance documentation and modification status, including defect reports, where relevant, are used to identify specific inspection/testing requirements |
| | 1.2 Appropriate preparation and access to the aircraft structure is undertaken to allow for proper inspection in accordance with maintenance documentation |
| | 1.3 Aircraft fabric-covered surfaces are inspected/tested for signs of damage, deterioration or loss of tensile strength in accordance with maintenance documentation and approved procedures while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.4 Damage or deterioration is assessed against limits specified by maintenance manual or other approved data to determine if repair, restoration or replacement is required |
| 2. Repair aircraft fabric surfaces | 2.1 Extent of damage is correctly assessed to assist in determining repair procedure |
| | 2.2 Structure is supported and prepared in accordance with the applicable maintenance manual to ensure personal safety and freedom from damage |
| | 2.3 Appropriate repair scheme is identified in accordance with maintenance manual and/or approved data |
| | 2.4 All materials and equipment required are organised |
| | 2.5 Fabric repairs are performed in accordance with approved repair scheme ensuring that aircraft standard practices are used and process requirements are carried out while observing all relevant WHS requirements, |

- including the use of MSDS and items of PPE
- 2.6 Work area is cleaned of all waste material or contaminants
 - 2.7 Components are adjusted and/or re-balanced, where necessary, to operate within prescribed specifications
 - 2.8 Required maintenance/repair documentation is completed and processed in accordance with standard enterprise procedures
 - 2.9 Where required repaired components or assemblies are tagged, sealed and packaged or cradled in accordance with specified procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Fabric surfaces to be inspected and tested for:

- Blockage of drainage and water and dirt collection points
- Deterioration of finishing scheme
- Deterioration of fabric tensile strength
- Damage to inspection panels and zips

Repair of fabric surface includes:

- Surface rejuvenation
- Stitching
- Unsewed doped-on repair
- Correct application of finishing scheme
- Recognition of requirement to re-balance fabric-covered control surfaces after rejuvenation or repair of fabric covering

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA357A Inspect, test and repair aircraft fabric surfaces

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA357 Inspect, test and repair aircraft fabric surfaces

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the selection and use of PPE and MSDS
- using approved maintenance documentation and aircraft publications relating to aircraft fabric surfaces
- testing the soundness of fabric surfaces
- recognising and assessing fabric surface damage and deterioration
- recognising defective doping
- identifying and applying applicable repair and surface rejuvenation schemes.

The underlying skills inherent in this unit should be transferable across a range of inspection and testing applications associated with maintenance of aircraft fabric surfaces. It is essential that the procedures take into account all aircraft and personal safety precautions, especially with regard to the use of finishing scheme materials.

This shall be demonstrated through application across a range of aircraft fabric surfaces. Ability to interpret inspection, testing and repair procedures and specifications (allowable limits) and apply them in practice is critical.

The application of the procedures should also clearly indicate knowledge of structural flight loads.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS hazards associated with fabric covering processes and how to obtain relevant MSDS and use PPE
- regulatory requirements relating to the repair of fabric surfaces
- industry publications relating to the repair of fabric surfaces
- aircraft fabric surface covering and finishing materials and principles
- fabric-covered component attachment methods
- types of fabric and related characteristics
- types of tape, cord and thread and their relative advantages and disadvantages

- cements and finishing scheme materials, their characteristics, uses, storage requirements and related safety precautions
- inspection and testing requirements for existing fabric coverings and new fabric prior to use
- the criteria for fabric rejuvenation, repairs and repair methods, including the need for re-balancing of flight control surfaces after fabric rejuvenation or repair
- the application of flight loads to fabric-covered surfaces, and related failure mechanisms.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on all of the following:
 - inspection/testing for:
 - blockage of drainage and water and dirt collection points
 - deterioration of finishing scheme
 - deterioration of fabric tensile strength
 - damage to inspection panels and zips
 - repair of fabric surface:
 - by surface rejuvenation
 - by stitching
 - by unsewed doped-on repair
 - correct application of finishing scheme
 - recognition of requirement to re-balance fabric-covered control surfaces after rejuvenation or repair of fabric covering.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA358 Re-cover aircraft fabric surfaces

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, knowledge of fabric surfaces and maintenance publications to re-cover aircraft fabric surfaces and apply correct finishing schemes during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include aircraft and aircraft components that are covered with fabric.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | |
|--------------------------------------|-----|---|
| 1. Re-cover aircraft fabric surfaces | 1.1 | Required covering materials and methods are determined from maintenance manual and/or approved data |
| | 1.2 | Required finishing scheme is determined from |

- maintenance manual and/or approved data
- 1.3 Materials and equipment required are organised
 - 1.4 Necessary structure and system inspection and preparation prior to covering is correctly performed while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE)
 - 1.5 Fabric covering is correctly fabricated and attached to the structure
 - 1.6 Drainage holes are correctly created
 - 1.7 Applicable finishing scheme is correctly applied while observing all relevant WHS requirements, including the use of MSDS and items of PPE
 - 1.8 Components are adjusted and/or re-balanced, where necessary, to operate within prescribed specifications
 - 1.9 Required maintenance/repair documentation is completed and processed in accordance with standard enterprise procedures
 - 1.10 Where required repaired components or assemblies are tagged, sealed and packaged or cradled in accordance with specified procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA358A Re-cover aircraft fabric surfaces

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA358 Re-cover aircraft fabric surfaces

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the correct selection and use of PPE and MSDS
- using approved maintenance documentation and aircraft publications relating to aircraft fabric surfaces
- inspecting structural members, wiring, grommets and system components and initiation of any necessary repair or rectification action
- fabricating and fitting fabric covering with appropriately placed inspection panels, zips and drainage holes
- applying fabric finishing scheme ready for paint
- recognising defective doping.

The underlying skills inherent in this unit should be transferable across a range re-covering applications associated with aircraft fabric surfaces. It is essential that the procedures take into account all aircraft and personal safety precautions, especially with regard to the use of finishing scheme materials.

This shall be demonstrated through application across a range of aircraft fabric surfaces. Ability to interpret re-covering procedures and specifications and apply them in practice is critical.

The application of the procedures should also clearly indicate knowledge of structural flight loads.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS hazards and how to obtain and use relevant MSDS and PPE
- regulatory requirements and industry publications relating to fabric covering of aircraft surfaces
- aircraft fabric surface covering and finishing materials and principles
- fabric-covered component attachment methods

- types of fabric and related characteristics
- types of tape, cord and thread and their relative advantages and disadvantages
- cements and finishing scheme materials, their characteristics, uses, storage requirements and related safety precautions
- fabric sewing techniques
- application techniques for cements and finishing schemes
- inspection and testing requirements for new fabric prior to use
- the need for re-balancing of flight control surfaces after re-covering, finishing scheme application and painting
- aircraft structure and system inspection requirements prior to re-covering with fabric
- the application of flight loads to fabric-covered surfaces, and related failure mechanisms
- the methods and procedures used (including doping and finishing) in re-covering components, such as wings, fuselages and control surfaces
- the requirements for the placement of inspection panels and zips, and for the creation of drainage holes.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least two (2) fabric surface re-covering tasks.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA359 Inspect and repair aircraft wooden structures

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of woodworking hand skills and knowledge and the use of maintenance publications to inspect and repair aircraft wooden structure and wooden components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activities
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|-----------------------------------|-----|---|
| 1. | Inspect aircraft wooden structure | 1.1 | Relevant maintenance documentation and modification status, including defect reports, where relevant, are used to identify specific inspection requirements |
| | | 1.2 | Appropriate preparation and access to the aircraft structure is undertaken to allow for proper inspection and testing in accordance with maintenance documentation |
| | | 1.3 | Aircraft wooden structure is visually or physically checked for signs of deterioration, deformation defects or damage in accordance with maintenance documentation and approved procedures while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | | 1.4 | Damage or defects are assessed against damage or wear limits specified by structural repair manual or other approved data to determine if repair or replacement is required |
| 2. | Repair aircraft wooden structure | 2.1 | Extent of deterioration or damage is correctly assessed to assist in determining repair procedure |
| | | 2.2 | Structure is supported and prepared in accordance with the applicable maintenance manual to ensure personal safety and freedom from damage |
| | | 2.3 | Appropriate repair scheme is identified in accordance with structural repair manual and/or approved data |
| | | 2.4 | Specialist advice is obtained in establishing an approved repair scheme where a standard repair scheme cannot be identified or damage is beyond limits |
| | | 2.5 | All materials and equipment required are organised |
| | | 2.6 | Structural repairs are performed in accordance with approved repair scheme ensuring that aircraft standard practices are used and process requirements are carried |

- out while observing all relevant WHS requirements, including the use of MSDS and items of PPE
- 2.7 Finishing scheme is restored while observing all relevant WHS requirements, including the use of MSDS and items of PPE
- 2.8 Work area is cleaned of all waste material or contaminants
- 2.9 Components are adjusted, where necessary, to operate within prescribed specifications
- 2.10 Required maintenance/repair documentation is completed and processed in accordance with standard enterprise procedures
- 2.11 Where required, repaired components or assemblies are tagged, sealed and packaged or cradled in accordance with specified procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Inspection and testing requirements include:

- Drainage and water and dirt collection points
- Fabric covered plywood surfaces
- Single and double plywood skin
- Structural timbers and bolt holes
- Glued joint strength
- Glue lines

Inspection techniques include:

- Visual inspection
- Physical checks
- Mensuration and alignment

Components to be repaired include:

- Load carrying structural timbers
- Plywood skin

- Spars and ribs.
- Finishing scheme includes:**
- Refinishing of structure after repair using approved finishing scheme
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA359A Inspect and repair aircraft wooden structures

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA359 Inspect and repair aircraft wooden structures

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the correct selection and use of PPE and MSDS
- using approved maintenance documentation and aircraft publications relating to aircraft wooden structure
- identifying and using woodworking tools
- identifying aircraft structural timbers and their characteristics
- identifying potential causes of deterioration in wooden structural components
- identifying wooden structure defects and damage
- identifying the condition of glue lines
- fabricating and fitting repair members
- gluing of wooden structure
- restoring surface finish after repair.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing and repair applications associated with maintenance of aircraft wooden structures. It is essential that the procedures take into account all aircraft and personal safety precautions relating to aircraft structure.

This shall be demonstrated through application across a range of aircraft wooden structures. Ability to interpret inspection and repair procedures and specifications (allowable limits) and apply them in practice is critical.

The application of the procedures should also clearly indicate knowledge of structural flight loads.

Knowledge Evidence

- Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:
- WHS hazards relating to wooden structure repair materials and how to obtain relevant MSDS and PPE

- aircraft wooden construction principles and inspection techniques
- wooden structural component attachment methods
- the effects of environmental factors on aircraft wooden structures
- wooden structure glues and application methods
- wooden component assembly methods and testing of joints
- wooden structure finishing schemes for exterior and interior surfaces
- the application of flight loads to aircraft wooden structural components and joints, and related failure mechanisms
- wooden component fabrication and repair techniques.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on all of the following:
 - inspection and/or testing of:
 - drainage and water and dirt collection points
 - fabric covered plywood surfaces
 - single and double plywood skin
 - structural timbers and bolt holes
 - glued joint strength
 - glue lines
 - inspection techniques must include visual inspection, physical checks, mensuration and alignment
 - repair of:
 - load carrying structural timbers
 - plywood skin
 - spars and ribs.
 - refinishing of structure after repair using approved finishing scheme.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA360 Maintain aircraft diesel engines

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, the use of maintenance publications and knowledge of diesel engine and system theory to inspect, test and troubleshoot, remove and install aircraft diesel engines and engine system components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include diesel engines fitted to light aircraft and driving fixed pitch propellers. Where the engine is driving a constant speed propeller, MEA307 Remove and install propeller systems and components and MEA315 Inspect, test and troubleshoot propeller systems and components, will also be required.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA353 Maintain basic light aircraft engines and propellers

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Inspect diesel engine and components/systems | 1.1 Isolation tags already attached to the system or related systems are checked and aircraft/engine configured for safe system inspection and operation in accordance with applicable maintenance manual |
| | 1.2 Diesel engine and components/systems are visually or physically checked for external and internal signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| 2. Test diesel engine | 2.1 Aircraft and engine are correctly prepared in accordance with applicable maintenance manual |
| | 2.2 Built-in system test functions and status displays are activated, where applicable, outputs recorded and interpreted |
| | 2.3 Assistance is provided with engine and/or system operation during prescribed test procedures to establish serviceability and correct function in accordance with applicable maintenance manual |
| 3. Troubleshoot diesel engine | 3.1 Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | 3.2 Maintenance manual fault diagnosis guide, downloaded maintenance data (where applicable) and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | 3.3 Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | 3.4 Diesel engine faults are located and the causes of the faults are clearly identified and correctly recorded in |

- maintenance documentation, where required
- 3.5 Fault rectification requirements are determined to assist in planning the repair
4. Remove diesel engine and engine system components
- 4.1 Aircraft is prepared and supported and rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure the safety of personnel and freedom from damage during engine removal
- 4.2 Removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
- 4.3 Engine is tagged and prepared for transport or storage in accordance with the specified procedures
- 4.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures
5. Install diesel engine and engine system components
- 5.1 Engine to be installed is checked to confirm correct part or model numbers, modification status and serviceability
- 5.2 Installation is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE
- 5.3 Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage
- 5.4 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Diesel engines and components/systems include:

- Two and four stroke diesel aircraft engines, main components and accessories/drives
- Super/turbo charging systems

Control system, including full authority digital engine control (FADEC)

- Starter system
- Fuel and air systems
- Cooling system (liquid or air as applicable to enterprise)
- Exhaust system
- Oil system (if dry sump) (where applicable to the enterprise)

Engine testing includes:

- Testing of engines fitted to helicopters (where auxiliary drive is not available) shall be carried out through the individual directing a pilot qualified on type

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA360A Maintain aircraft diesel engines

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA360 Maintain aircraft diesel engines

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the use of PPE and MSDS
- using relevant maintenance documentation and aircraft manuals
- recognising external and internal signs of defects in aircraft diesel engines, components and system components through visual/physical inspection
- assisting with testing of diesel engine and engine system operation, be able to operate systems, monitor indications, record parameters and recognise correct function
- compiling engine condition monitoring records
- rigging and adjusting engine controls and systems, including FADEC systems
- using fault diagnosis guides and equivalent data to accurately and efficiently troubleshoot the causes of unserviceabilities in diesel engines and engine systems, clearly record details and identify the required rectification actions
- correctly removing and installing diesel engines and engine components.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing, troubleshooting and removal and installation tasks (including the timely involvement of supervisor or other trades) associated with diesel aircraft engines and engine systems. It is essential that system testing procedures take into account all safety precautions associated with diesel engine system operation (including interfaces with FADEC systems) and that awareness be demonstrated of dual inspection requirements associated with work on engine controls. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This shall be demonstrated through application across a number of engine systems or types.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS procedures associated with engine and propeller maintenance, including lifting and handling of heavy objects and how to obtain PPE and MSDS
- fault diagnosis techniques

- two and four stroke diesel aircraft engines and engine system layout and operation:
 - principles of operation of two and four stroke diesel engines
 - component function, construction and materials
 - engine operation
 - engine power, efficiency and performance
- diesel aircraft engine super/turbo charging systems
- diesel aircraft engine fuels and lubricating oils
- diesel fuel injection systems
- FADEC operation
- diesel aircraft engine induction systems
- diesel aircraft engine cooling systems (liquid and air)
- diesel aircraft engine exhaust systems
- system component operation, including electrical and instrument system interfaces
- dry sump lubrication systems
- removal and installation procedures for diesel aircraft engines and engine components
- diesel aircraft engine maintenance requirements and troubleshooting
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures and functional checks should indicate knowledge of system operation. Engine system operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to carry out engine control system checks and troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - two and four stroke diesel aircraft engines, main components and accessories/drives
 - super/turbo charging systems
 - control system, including FADEC (where applicable to enterprise)
 - starter system
 - fuel and air systems
 - cooling system (liquid or air as applicable to enterprise)

- exhaust system
- oil system (if dry sump) (may be omitted where not applicable to the enterprise).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA361 Maintain aircraft two stroke petrol engines

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, the use of maintenance publications and knowledge of two stroke petrol engine and system theory to inspect, test and troubleshoot, remove and install aircraft two stroke petrol engines and engine system components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include aircraft two stroke petrol engines driving fixed pitch propellers. Where the engine is driving a constant speed propeller, MEA307 Remove and install propeller systems and components and MEA315 Inspect, test and troubleshoot propeller systems and components, will also be required.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA353 Maintain basic light aircraft engines and propellers

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|---|-----|---|
| 1. | Inspect two stroke petrol engine and components/systems | 1.1 | Isolation tags already attached to the system or related systems are checked and aircraft/engine configured for safe system inspection and operation in accordance with applicable maintenance manual |
| | | 1.2 | Two stroke petrol engine and components/systems are visually or physically checked for external and internal signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| 2. | Test two stroke petrol engines | 2.1 | Aircraft and engine are correctly prepared in accordance with applicable maintenance manual |
| | | 2.2 | Assistance is provided with engine and/or system operation during prescribed test procedures to establish serviceability and correct function in accordance with applicable maintenance manual |
| 3. | Troubleshoot two stroke petrol engines | 3.1 | Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | | 3.2 | Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | | 3.3 | Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | | 3.4 | Two stroke petrol engine faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required |
| | | 3.5 | Fault rectification requirements are determined to assist in planning the repair |

- | | | |
|--|-----|---|
| 4. Remove two stroke petrol engine and engine system components | 4.1 | Aircraft is prepared and supported and rendered safe in accordance with the applicable maintenance manual and isolation tags are fitted, where necessary, to ensure the safety of personnel and freedom from damage during engine removal |
| | 4.2 | Removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 4.3 | Engine is tagged and prepared for transport or storage in accordance with the specified procedures |
| | 4.4 | Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 5. Install two stroke petrol engine and engine system components | 5.1 | Engine to be installed is checked to confirm correct part or model numbers, modification status and serviceability |
| | 5.2 | Installation is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 5.3 | Support/safety equipment is removed at the appropriate time to ensure personnel safety and freedom from structural damage |
| | 5.4 | Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional

contexts) are included.

Two stroke engines and components/systems include:

- Two stroke petrol aircraft engines, main components, including reduction gearboxes and accessories/drives
- Ignition systems
- Control systems
- Starter systems
- Fuel and air systems
- Cooling systems (liquid or air as applicable to enterprise)
- Exhaust systems

Testing of engines includes:

- Testing of engines fitted to helicopters (where auxiliary drive is not available) shall be carried out through the applicant directing a pilot qualified on type

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA361A Maintain aircraft two stroke petrol engines

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA361 Maintain aircraft two stroke petrol engines

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the use of PPE and MSDS
- using relevant maintenance documentation and aircraft manuals
- recognising external and internal signs of defects in two stroke petrol aircraft engines, components and system components through visual/physical inspection
- assisting with testing of two stroke petrol engine and engine system operation, be able to operate systems, monitor indications, record parameters and recognise correct function
- compiling engine condition monitoring records
- rigging and adjusting engine controls and systems
- using fault diagnosis guides and equivalent data to accurately and efficiently troubleshoot the causes of unserviceabilities in two stroke petrol engines and engine systems, clearly record details and identify the required rectification actions
- correctly removing and installing two stroke petrol engine and engine components.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing, troubleshooting and removal and installation tasks (including the timely involvement of supervisor or other trades) associated with two stroke petrol aircraft engines and engine. It is essential that system testing procedures take into account all safety precautions associated with two stroke petrol engine system operation and that awareness be demonstrated of dual inspection requirements associated with work on engine controls. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This shall be demonstrated through application across a number of engine systems or types.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS procedures associated with engine maintenance, including lifting and handling of heavy objects and how to obtain PPE and MSDS
- fault diagnosis techniques

- two stroke petrol aircraft engine layout and operation:
 - principles of operation of two stroke engines
 - component function, construction and materials
 - engine operation
 - engine power, efficiency and performance
- two stroke aircraft engine fuels, oils and fuel/oil mixing
- components, layout and operation of two stroke petrol aircraft engine:
 - fuel systems
 - ignition systems:
 - magneto
 - coil
 - spark plugs
 - ignition harnesses
 - switches
 - starting systems
 - induction systems
 - cooling systems (liquid and air)
 - exhaust systems
 - electrical and instrument system interfaces:
 - battery charging system
 - tachometer
- removal and installation procedures for two stroke petrol aircraft engines and engine components
- petrol two stroke aircraft engine maintenance requirements and troubleshooting
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- The application of testing procedures and functional checks should indicate knowledge of system operation. Engine system operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to carry out engine control system checks and troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.

- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on at least one (1) item from each of the following groups:
 - two stroke petrol aircraft engines, main components, including reduction gearboxes and accessories/drives
 - ignition systems
 - control systems
 - starter systems
 - fuel and air systems
 - cooling systems (liquid or air as applicable to enterprise)
 - exhaust systems.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA362 Maintain aircraft vapour cycle air conditioning systems

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills, the use of maintenance publications and knowledge of vapour cycle air conditioning systems to inspect, test and troubleshoot systems, and to remove and install mechanical and electrical system components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Compliance with applicable regulations is required where refrigerant evacuation and recharging is performed.

Applications include all aircraft vapour cycle air conditioning systems and components.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a Civil Aviation Safety Authority (CASA) licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA201	Remove and install miscellaneous aircraft electrical hardware/components
MEA246	Fabricate and/or repair aircraft electrical components or parts

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | | | |
|----|--|-----|---|
| 1. | Inspect vapour cycle air conditioning systems | 1.1 | Isolation tags already attached to the system or related systems are checked and aircraft/engine configured for safe system inspection and operation in accordance with applicable maintenance manual |
| | | 1.2 | Vapour cycle air conditioning systems are visually or physically checked for external and internal signs of defects in accordance with applicable maintenance manual while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| 2. | Test vapour cycle air conditioning systems | 2.1 | Aircraft and system are correctly prepared in accordance with applicable maintenance manual |
| | | 2.2 | Vapour cycle air conditioning system is tested in accordance with prescribed test procedures to establish serviceability and correct function in accordance with applicable maintenance manual |
| 3. | Troubleshoot vapour cycle air conditioning systems | 3.1 | Available information from maintenance documentation and inspection and test results is used, where necessary, to assist in fault determination |
| | | 3.2 | Maintenance manual fault diagnosis guide and logical processes are used to ensure efficient and accurate troubleshooting to line replacement level |
| | | 3.3 | Specialist advice is obtained, where required, to assist with the troubleshooting process |
| | | 3.4 | Vapour cycle air conditioning system faults are located and the causes of the faults are clearly identified and correctly recorded in maintenance documentation, where required |
| | | 3.5 | Fault rectification requirements are determined to assist in planning the repair |
| 4. | Remove vapour cycle air | 4.1 | Aircraft and vapour cycle air conditioning system is rendered safe in accordance with the applicable |

- | | |
|--|---|
| conditioning system components | maintenance manual and isolation tags are fitted, where necessary, to ensure the safety of personnel and freedom from damage during component removal |
| | 4.2 Where refrigerant evacuation is necessary, evacuation is performed in accordance with regulatory requirements and maintenance manual procedures |
| | 4.3 Component removal is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 4.4 Component is tagged and prepared for transport or storage in accordance with the specified procedures |
| | 4.5 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |
| 5. Install vapour cycle air conditioning system components | 5.1 Component to be installed is checked to confirm correct part or model numbers, modification status and serviceability |
| | 5.2 Installation is carried out in accordance with the applicable maintenance manual while observing all relevant WHS requirements, including the use of MSDS and items of PPE |
| | 5.3 Vapour cycle air conditioning system is recharged with refrigerant, where necessary, in accordance with maintenance manual procedures and regulatory requirements |
| | 5.4 Vapour cycle air conditioning system is tested for correct function and freedom from refrigerant leaks if system recharging has been performed |
| | 5.5 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Vapour cycle air conditioning systems include:

- Refrigeration system compressor, condenser, receiver dryer, thermal expansion valve and evaporator
 - Magnetic clutch and drive system (belt, power take-off, electric motor, hydraulic motor or pneumatic as applicable)
 - Condenser extension and retraction system
 - Blower
 - Throttle system shutoff
 - Temperature control system
- Procedures and requirements include:**
- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA362A Maintain aircraft vapour cycle air conditioning systems

Links

Companion Volume implementation guides are found in VETNet -

Assessment Requirements for MEA362 Maintain aircraft vapour cycle air conditioning systems

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- applying relevant WHS procedures, including the selection and use of applicable PPE and MSDS
- complying with regulatory requirements regarding the de-gassing of vapour cycle air conditioning systems
- using relevant maintenance documentation and aircraft manuals
- recognising external and internal signs of defects in vapour cycle air conditioning systems and system components through visual/physical inspection
- testing of vapour cycle air conditioning system operation, be able to operate systems and leak testing equipment, monitor indications and recognise correct function
- using specialist equipment to evacuate and recharge refrigerant
- using fault diagnosis guides and equivalent data to accurately and efficiently troubleshoot the causes of unserviceabilities in vapour cycle air conditioning systems, clearly recording details and identifying the required rectification actions
- correctly removing and installing vapour cycle air conditioning system electrical and mechanical components.

The underlying skills inherent in this unit should be transferable across a range of inspection, testing, troubleshooting and removal and installation tasks (including the timely involvement of supervisor or other trades) associated with vapour cycle air conditioning systems and components. It is essential that system testing procedures take into account all safety precautions associated with vapour cycle air conditioning system operation and testing, and that regulations relating to the evacuation and recharging of refrigerant be strictly observed. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

This shall be demonstrated through application across a number of aircraft vapour cycle air conditioning systems.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- WHS procedures associated with vapour cycle air conditioning system maintenance, including the selection and use of PPE
- how to obtain applicable MSDS
- regulations applying to the evacuation and recharging of refrigerant
- fault diagnosis techniques
- vapour cycle air conditioning system layout and operation
- vapour cycle air conditioning system electrical and mechanical component operation:
 - compressor
 - condenser
 - receiver dryer
 - thermal expansion valve
 - evaporator
 - magnetic clutch and drive system:
 - belt
 - power takeoff
 - electric motor
 - hydraulic motor
 - pneumatic
 - condenser extension and retraction system
 - blower
 - throttle system shutoff
 - temperature control system
- refrigerant used in aircraft vapour cycle air conditioning systems
- lubricants used in compressors
- equipment used to test systems and evacuate and recharge refrigerant
- procedures for evacuating and recharging system refrigerant
- refrigerant leak testing techniques and equipment
- removal and installation procedures for vapour cycle air conditioning system components
- vapour cycle air conditioning system maintenance requirements
- relevant maintenance manuals
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.

- The application of testing procedures and functional checks should indicate knowledge of system operation and regulations relating to refrigerant. Vapour cycle air conditioning system operation knowledge, the relationship of individual components and the links with other systems will be necessary to supplement evidence of ability to carry out engine control system checks and troubleshoot the system within the limits of the aircraft/system fault-finding guide before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on a system and at least one (1) component in each of the following groups:
 - refrigeration system compressor, condenser, receiver dryer, thermal expansion valve and evaporator
 - magnetic clutch and drive system (belt, power takeoff, electric motor, hydraulic motor or pneumatic as applicable)
 - condenser extension and retraction system
 - blower
 - throttle system shutoff
 - temperature control system.
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA364 Maintain and/or repair small aircraft mechanical components or parts

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires application of hand skills and the use of relevant maintenance publications to maintain and repair a range of aircraft mechanical components during the performance of scheduled or unscheduled maintenance. Maintenance may be performed individually or as part of a team.

Applications include fixed and rotary wing aircraft classified by the Civil Aviation Safety Authority (CASA) as small aircraft and components in workshops.

The unit is part of the Mechanical Certificate IV (Aircraft Maintenance Stream) training pathway.

Where a CASA licensing outcome is sought this unit forms part of the CASA requirement for the granting of the chosen maintenance certification licence under Civil Aviation safety regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

Pre-requisite Unit

MEA101	Interpret work health and safety practices in aviation maintenance
MEA103	Plan and organise aviation maintenance work activity
MEA105	Apply quality standards applicable to aviation maintenance processes
MEA107	Interpret and use aviation maintenance industry manuals and specifications
MEA108	Complete aviation maintenance industry documentation
MEA109	Perform basic hand skills, standard trade practices and fundamentals in aviation maintenance

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|--|--|
| 1. Maintain and/or repair mechanical components or parts | 1.1 Maintenance and/or repair requirements are determined, following disassembly and assessment of component parts for serviceability, in accordance with the relevant maintenance documentation |
| | 1.2 Tagging and repair instructions are accurately specified for parts requiring specialist repair |
| | 1.3 Appropriate materials, tools, equipment and assembly or fabrication jigs are selected and prepared for the particular specification requirements |
| | 1.4 Components or parts are maintained, repaired or modified as approved by relevant manufacturers' bulletins or procedures in accordance with required specifications |
| | 1.5 Mechanical component parts are assembled within specified tolerances and in accordance with the appropriate maintenance documents while observing all relevant work health and safety (WHS) requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 1.6 Mechanical components are adjusted, as required, to operate within prescribed specifications |
| | 1.7 Test equipment and rigs are used, where applicable, to confirm serviceability |
| | 1.8 Maintained/repaired or modified components are tagged, sealed and packaged within specified procedures |
| | 1.9 Required maintenance documentation is completed and processed in accordance with standard enterprise procedures |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

- | | |
|--|---|
| Components or parts to be maintained and/or repaired, if applicable to the enterprise, include: | <ul style="list-style-type: none"> • Hoses • Pipes • Cables, pulleys, chains, sprockets and gear drives • Control rods, bellcranks, links and screwjacks • Trim panels; linings; seats; cabin equipment and consoles; coverings; and emergency equipment stowage, including passenger escape systems, life jackets, rafts, location transmitters, cargo, crew and/or passenger seat restraints |
| Maintain includes: | <ul style="list-style-type: none"> • Cleaning, inspection for wear or damage and adjustment and lubrication, where applicable |
| Repair includes: | <ul style="list-style-type: none"> • Standard techniques for pipes and replacement of eye-ends, tubes or bearings for control rods/pulleys/sprockets and bushes or bearings for bellcranks and links • The use of adhesives and appropriate patch materials for trim and upholstery repairs (more extensive repairs involving sewing are covered by MEA509 Manufacture, repair and alter aircraft-related fabric components) • Replacement of restraint system components where sewing is not required (more extensive repairs are covered by MEA508 Maintain, install and remove restraint systems) |
| Procedures and requirements include: | <ul style="list-style-type: none"> • Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise |

Assessment Requirements for MEA364 Maintain and/or repair small aircraft mechanical components or parts

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and include:

- applying relevant WHS practices including the selection and use of PPE and MSDS
- using relevant maintenance documentation, specifications and aircraft/component manuals to:
 - recognise state of serviceability and repair requirements for the range of components listed in the Range of Conditions that are applicable to the enterprise
 - identify requirements and complete repairs and/or modifications
 - test and/or adjust components as required
- correctly tagging, sealing and packaging completed components that are not being immediately refitted.

The underlying skills inherent in this unit should be transferable across a range of maintenance and repair applications associated with aircraft components. It is essential that the relevant procedures are interpreted and applied to ensure quality and safety standards are achieved.

This shall be demonstrated through application across a number of different aircraft components.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- mechanical component operation and repair procedures and processes:
 - hoses
 - pipes
 - cables, turnbuckles and tensioning devices
 - pulleys
 - chains and sprockets
 - gear drives
 - screwjacks

- control rods
- bellcranks
- links
- internal fittings and emergency equipment operation, construction, installation and maintenance/repair:
 - trim panels
 - linings and coverings
 - seats and crew/passenger restraints
 - cargo restraints
 - cabin equipment and consoles
- emergency equipment inspection and stowage requirements:
 - passenger escape systems
 - life jackets
 - rafts
 - emergency location transmitters
- applicable WHS procedures, including the selection and use of items of PPE
- how to obtain relevant MSDS
- how to identify suitable adhesives and patching materials for upholstery and trim
- inspection and test requirements for restraint system components
- safe stowage requirements for items of emergency equipment
- how to determine serviceability of items of emergency equipment
- relevant maintenance manuals, standards and specifications
- relevant regulatory requirements and standard procedures.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that applicable general and special-purpose tools and test equipment found in most routine situations would be used where appropriate.
- Ability to assess component serviceability and interpret parts requirements will be necessary before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of the Regulators (ADF and CASA) and maintenance stakeholders and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the relevant elements and performance criteria of the unit of competency are being achieved under routine supervision on the components or parts that are applicable to the enterprise, from each of the following groups:
 - hoses
 - pipes
 - cables, pulleys, chains, sprockets and gear drives
 - control rods, bellcranks, links and screwjacks

- trim panels; linings; seats; cabin equipment and consoles; coverings; and emergency equipment stowage, including passenger escape systems, life jackets, rafts, location transmitters, cargo, crew and/or passenger seat restraints).
- This shall be established via the records in the Log of Industrial Experience and Achievement or, where appropriate, an equivalent Industry Evidence Guide (for details refer to the Companion Volume Assessment Guidelines).
- Assessors must satisfy the requirements of the National Vocational Education and Training Regulator (Australian Skills Quality Authority, or its successors).
- Where the unit is to be used for CASA licensing purposes the Assessor must also meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA365 Assess structural repair/modification requirements and evaluate structural repairs and modifications

Modification History

Release 1 - New unit of competency

Application

This unit of competency requires interpretation of structural repair and modification data to determine required action and to determine the compliance with airworthiness requirements of completed structural repairs or modifications. In addition, the performance of colour contrast dye penetrant non-destructive testing (NDT) on applicable components is included.

Applications include both fixed and rotary wing aircraft.

The unit covers some of the competencies required to progress from an Aircraft Maintenance Engineer (AME) at Certificate IV to the granting of a chosen maintenance certification licence under Civil Aviation Safety Regulation (CASR) Part 66, in accordance with the licensing provisions in the Companion Volume Implementation Guide.

The skills and knowledge covered by the units of competency listed in the MEA Aeroskills Training Package for Aircraft Maintenance Engineer at Certificate IV are prerequisite to the attainment of the elements of competency specified in this unit. This includes full coverage of the CASR Part 66 Syllabus subjects/topics listed in the Companion Volume CASA Interface.

Pre-requisite Unit

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

- | | |
|---|--|
| 1. Assess structural repair or modification | 1.1 Structural repair requirements are determined from |
|---|--|

- | | |
|--|--|
| requirements | maintenance manuals or approved repair schemes |
| | 1.2 Damage beyond repair scheme limits is referred to relevant personnel/authorities |
| | 1.3 Modification requirements are determined from approved drawings and specifications/ instructions or requirements are referred to relevant personnel/authorities |
| | 1.4 Completed work is evaluated for compliance with airworthiness requirements |
| 2. Perform colour contrast dye penetrant NDT | 2.1 Inspection requirements are identified from relevant maintenance data or to confirm a visually identified defect |
| | 2.2 Surfaces to be inspected are prepared for the dye penetrant process |
| | 2.3 Dye penetrant materials are selected in accordance with standard operating procedures |
| | 2.4 Penetrant test is performed in accordance with standard operating procedures and while observing all relevant work health and safety (WHS) precautions |
| | 2.5 Defect indications are checked and identified in accordance with standard operating procedures |
| | 2.6 Penetrant testing equipment is correctly maintained and stored while observing all relevant WHS requirements, including the use of material safety data sheets (MSDS) and items of personal protective equipment (PPE) |
| | 2.7 Results are recorded in accordance with standard enterprise and regulatory requirements |

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect

performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Range of tasks and practices includes:

- Standard practices for structural repair and modification, including damage measurement and assessment against approved repair schemes
- The process for referral of damage details and modification requirements to relevant personnel/authorities
- Supervision of repair scheme and modification incorporation, including evaluation of work against drawings and specifications
- Scheduled or unscheduled maintenance
- Individual activities or supervision of other personnel performing maintenance tasks classified in CASR part 145 as specialist maintenance, including:
 - non-destructive inspection
 - welding
 - surface plating
 - surface finishing
 - preparing structural repair components
 - machining

Surface preparation for dye penetrant NDT includes:

- Removal of surface finishes where applicable
- Thorough cleaning of the surface
- Drying of the surface
- Processes included in standard procedures

Dye penetrant materials include:

- Appropriate surface cleaning materials
- Emulsifiers
- Developers
- Materials for surface cleaning after testing

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Assessment Requirements for MEA365 Assess structural repair/modification requirements and evaluate structural repairs and modifications

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- interpreting damage limits and identifying applicable repair schemes
- interpreting all requirements of modification drawings and assessing work against them
- evaluating completed repairs and modifications for compliance with the applicable data and with airworthiness requirements
- recognising weld defects
- performing colour contrast dye penetrant NDT to confirm defects in applicable aircraft components
- application of relevant WHS practices, including the use of MSDS and PPE.

The underlying skills inherent in this unit should be transferable across a range of repair and modification applications related to the structure of aircraft. It is essential that the repair and modification procedures take into account all applicable safety precautions. The ability to interpret repair scheme and modification requirements, including applicable specifications (allowable limits) and ensure that they are applied in practice is critical.

This must be demonstrated through the correct determination of repair requirements and the determination of compliance with repair schemes and modification drawings.

The ability to assess sound weld repairs must also be demonstrated.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge at a post-trade level of:

- application of regulatory requirements and of manufacturer's requirements in the determination of structural maintenance needs
- assessment of the extent of damage and an understanding of the need for a professional engineer to develop or extend a repair scheme where damage is beyond the limits of maintenance manual repair schemes, including the identification of relevant personnel and authorities

- assessment of new equipment or component mounting requirements and an understanding of the need to have drawings and specifications developed by a professional engineer, including the identification of relevant personnel and authorities
- the need for shoring and support to maintain aerodynamic shape and for safe performance of structural maintenance
- the need for mensuration checks and the techniques used to perform them
- how to determine welding requirements and the recognition of sound welds
- the correct application of colour contrast dye penetrant NDT and the limitations of the testing method
- dye penetrant test procedures:
 - relevant WHS precautions and how to obtain PPE and MSDS
 - cleaning and preparation processes and materials
 - consequences of incorrect preparation
 - basic concepts and principles of NDT and appropriate use of the colour contrast dye penetrant technique
 - general properties of penetrants (penetrability, removability and visibility)
 - types of emulsifiers and developers
 - established procedures and techniques
 - defect types and their consequences
 - post-test cleaning methods
- aircraft welding regulations
- aircraft welding processes and relevant parent metal groups
- defects applicable to each welding process and parent metal group.

Assessment Conditions

- Competency will be assessed in the training environment using a combination of practical exercises and scenarios. Applicable work plans should take account of applicable safety (including safe handling of heavy components) and quality requirements in accordance with the industry and regulatory standards.
- The following conditions of assessment represent the requirements of CASA and must be rigorously observed.
- A person cannot be assessed as competent until it can be demonstrated to the satisfaction of the workplace assessor that the elements and performance criteria of the unit of competency are being achieved across the tasks and practices listed in the Range of Conditions under supervision without intervention.
- This shall be established via simulated activities at the CASR Part 147 Maintenance Training Organisation and performance during observed workplace activities.
- The Assessor must meet the criteria specified in the CASR Part 147 Manual of Standards.

MEA366 Perform borescope inspections

Modification History

Release 1 - New unit of competency

Application

This unit of competency is applied in conjunction with units relating to the inspection, testing and troubleshooting of piston engines and gas turbine engines (either installed in aircraft or in workshops), to perform and assess the results of remote visual inspections using borescopes.

The unit is required for the grant of approval for Aircraft Maintenance Engineers to perform borescope inspections on aircraft system components and engines during scheduled or unscheduled maintenance.

The unit is used in workplaces that operate under the airworthiness regulatory systems of the Australian defence Force (ADF) and the Civil Aviation Safety Authority (CASA).

Pre-requisite Unit

MEA313 Inspect, test and troubleshoot piston engine systems and components

OR

MEA314 Inspect, test and troubleshoot gas turbine engine systems and components

OR

MEA322 Test and troubleshoot gas turbine engine systems and components

OR

MEA387 Test gas turbine engines and engine modules after overhaul or repair

OR

MEA388 Repair and/or overhaul piston engines

Competency Field

Aviation maintenance

Unit Sector

Elements and Performance Criteria

Elements describe the essential outcomes.

Performance criteria describe the performance needed to demonstrate achievement of the element.

1.	Set up borescope equipment	1.1	Applicable borescope equipment is obtained and assembled for use
		1.2	Assembled borescope equipment is tested for correct operation
2.	Perform borescope inspection	2.1	Component or engine is prepared for safe borescope inspection in accordance with applicable maintenance data
		2.2	Borecope inspections are performed in accordance with applicable maintenance data or standard operating procedures
3.	Record and assess borescope inspection results	3.1	Borecope inspection results are recorded and processed in accordance with standard enterprise procedures for the applicable borescope equipment
		3.2	Identified defects are recorded and reported in accordance with standard enterprise procedures
4.	Maintain and re-pack borescope equipment for storage	4.1	Borecope equipment is disassembled, maintained and cleaned in accordance with manufacturer's instructions
		4.2	Borecope equipment is replaced in transport or storage containers and stored in accordance with standard enterprise procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

This field allows for different work environments and conditions that may affect performance. Essential operating conditions that may be present (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) are included.

Borescope equipment includes:

- Rigid optical borescopes
- Flexible optical borescopes
- Video borescopes
- Camera attachments for optical borescopes
- Remote engine rotation equipment

Applicable maintenance data includes:

- Borecope user manuals
- Engine maintenance manuals
- Servicing schedules
- Regulatory requirements, such as Airworthiness Directives or Special Technical Instructions

Procedures and requirements include:

- Industry standard procedures specified by manufacturers, regulatory authorities or the enterprise

Unit Mapping Information

Release 1 – equivalent to MEA366A Perform borescope inspections

Assessment Requirements for MEA366 Perform borescope inspections

Modification History

Release 1 - New unit of competency

Performance Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria under the specified conditions of assessment, and must include:

- selecting applicable borescope equipment and assembling it for use
- identifying required borescope inspections and required techniques using applicable maintenance data
- setting up the applicable system component or engine in accordance with applicable maintenance data for safe borescope inspection
- applying borescope inspection techniques to safely perform required inspections without damage to engine components
- identifying and correctly assessing and reporting/recording defect indications
- maintaining and correctly storing borescope equipment after use.

The underlying skills inherent in this unit should be transferable across a range of remote visual inspection applications associated with internal engine components. It is essential that inspection procedures take into account all safety precautions associated with borescope inspection techniques and the applicable engine.

This shall be demonstrated through application across a representative range of borescope inspection tasks that are performed within the enterprise. Ability to interpret inspection procedures and specifications (allowable limits) and apply them in practice is critical.

Knowledge Evidence

Evidence required to demonstrate competency in this unit must be relevant to and satisfy all of the requirements of the elements and performance criteria and include knowledge of:

- types of borescope and their applications
- how to assemble borescope equipment and prepare it for use
- use of associated imaging and recording equipment, such as video and digital camera
- use of maintenance data to identify borescope inspection requirements
- borescope inspection techniques and safety
- remote engine rotation equipment
- defect assessment techniques
- borescope inspection reporting and recording requirements

- borescope maintenance and storage requirements.

Assessment Conditions

- Competency should be assessed in the work environment or simulated work environment using tools and equipment specified in maintenance documentation. It is also expected that general-purpose tools and test equipment found in most routine situations would be used where appropriate.
- Demonstrated knowledge of both borescope inspection techniques and of the subject engine will be necessary before undertaking any action. The work plan should take account of applicable safety and quality requirements in accordance with the industry and regulatory standards.
