T5 Single phase motors – capacitor and shaded pole types encompassing:

- identification of single phase induction motors including capacitor start, capacitor start/capacitor run, permanent split capacitor (PSC) and shaded pole
- principles of operation of each motor type listed above.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- operating characteristics and typical applications of each motor type listed above.
- connection and running each type of motor listed.
- reversing the direction of rotation of each of the capacitor type motors.

T6 Single phase motors – universal encompassing:

- principles of operation of a series universal motor.
- identification and functions of each of the basic parts of a series universal motor.
- operating characteristics and typical uses for a series universal motor.
- connecting, running and reversing a series universal motor.

T7 Motor protection encompassing:

- reasons why motor protection is required.
- requirements of the AS/NZS3000 Wiring rules with regards to motor protection.
- types of motor overload protection.
- operating principles of microtherm devices, thermal and magnetic motor protection devices.
- electrical features of motor protection HRC fuses.
- effects of under voltage and over voltage on motors and motor circuits.
- effects of repetitive starting and/or reversing on motors.
- special requirements for motor protection, in high humidity or moist environments, high temperature areas and corrosive atmospheres.
- operating principles of phase failure protection.
- selecting suitable protective devices for a given motor and starter combination.

T8 Three phase synchronous machines- operation principles and construction encompassing:

- power transfer diagram of an a.c. synchronous machine.
- need for the generation of a sinusoidal waveform.
- principles of operation of a synchronous alternator.
- principles of operation of a synchronous motor.
- principles of operation of an asynchronous generator (induction generator).
- identification of main parts of a synchronous alternator/motor.
- methods used to provide the excitation of a synchronous alternator/motor.
- block diagram of an alternator voltage regulator.
- advantages gained by the parallel operation of alternators.
- starting methods of synchronous motors.

T9 Alternators and generators encompassing:

- effects on the generated voltage of variations in excitation.
- effects on generated voltage of variations in load.
- identification of characteristic curves of an alternator.
- types of prime movers used with single and three phase portable/standby alternators.
- manual operation of single and three phase portable/standby alternators.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- ratings of single and three phase portable/standby alternators.
- applications of single and three phase portable/standby alternators.
- construction details of single and three phase portable/standby alternators.
- common faults found in portable/standby alternators.

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.1)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines - UEE07'. Evidence shall also comprise:

- A representative body of performance criteria demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Solve problems in single and three phase low voltage machines as described as described in 8) and including:

    A Determining the operating parameters of existing machines.

    B Altering an existing machine to comply with specified operating parameters.

    C Developing machines/circuits to comply with a

EVIDENCE GUIDE

specified function and operating parameters.

D Determining the cause of low efficiency in an existing machine.

E Determining conditions causing an existing circuit to be unsafe.

F Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to solving problems in single and three phase low voltage machines.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note: Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

There are no concurrent assessment recommendations for this unit.

The critical aspects of occupational health and safety covered in unit UEENEEE001B and other discipline specific occupational health

EVIDENCE GUIDE

and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

8) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to any four of the following problems in single and three-phase low voltage machine and circuits.

- Determining the operating parameters of existing machines
- Altering an existing machine circuit to comply with specified operating parameters
- Developing machine circuits to comply with a specified function and operating parameters

Note:
Operating parameters include voltage, current, torque, efficiency, power, energy and power factor

- Determining the cause of low efficiency in an existing machine.
- Determining problems in existing machines to malfunction

Note:
Problems include bearing noise/faults, vibration, undervoltage, unbalanced windings

- Determining conditions causing an existing machine/circuit to be unsafe.

Note:
Examples of unsafe circuits includes electric shock hazard from indirect contract with conductive parts, insufficiently low impedance of a fault current path and inadequate fault protection

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1**)

1.1) **Descriptor**

This unit covers ascertaining correct operation of single and three phase low voltage electrical apparatus and circuits and solving circuit problems as they apply to servicing, fault finding, installation and compliance work functions. It encompasses safe working practices, apparatus circuit arrangements, issues related to operation, characteristics and protection and solutions to apparatus/circuit problems derived from calculated and measured parameters.

Application of the Unit

Not Applicable

Licensing/Regulatory Information

1.2) **License to practice**

During Training: Competency development activities are subject to regulations directly related to licencing, occupational health and safety and where applicable contracts of training such as apprenticeships.

In the workplace: The application of the skills and knowledge described in this unit require a license to practice in the workplace where work is carried out on electrical equipment or installations which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

Other conditions may apply under State and Territory legislative and regulatory requirements.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Pre-Requisites

Prerequisite Unit(s) **2)**

2.1) Competencies

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle, assemble of electrotechnology components
UEENEEE104A	Solve problems in d.c circuits
UEENEEE105A	Fix and secure electrotechnology equipment
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEG101A	Solve problems in electromagnetic devices and related circuits
UEENEEG102A	Solve problems in low voltage a.c. circuit
UEENEEG106A	Terminate cables, cords and accessories for low voltage circuits

Employability Skills Information

Employability Skills **3)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged

will assist in identifying Employability Skill requirements.

Application of the Unit

4)

4.1) **General Application**

This unit applies to all qualifications, competencies and/or Skill Sets which require an electrical licence.

4.2) **Importation**

RTOs wishing to import this unit into any qualification under the flexibility provisions of NQC Training Package Policy

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a unit of competency

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to solve single and three phase low voltage electrical apparatus/ circuit problems.	1.1 OHS procedures for a given work area are identified, obtained and understood.
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed.
	1.3 Safety hazards, which have not previously been identified, are noted and established risk control measures are implemented.
	1.4 The nature of the apparatus/circuit(s) problem is obtained from documentation or from work supervisor to establish the scope of work to be undertaken.
	1.5 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.6	Sources of materials that may be required for the work are established in accordance with established procedures.
	1.7	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2 Solve single and three phase low voltage electrical apparatus/circuit problems.	2.1	OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Apparatus/circuits/plant is checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Established methods are used to solve apparatus/circuit problems from measure and calculated values as they apply to single and three-phase low voltage apparatus/circuit.
	2.5	Established methods for dealing with unexpected situations are discussed with appropriate person or persons and documented.
	2.6	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.7	Problems are solved without damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practices.
3 Complete work and document problem solving activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Justification for solutions used to solve apparatus/circuit problems is documented.
	3.4	Work completion is documented and an appropriate person or persons notified in accordance with

ELEMENT **PERFORMANCE CRITERIA**

established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

7) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and solving problems in single and three phase low voltage electrical apparatus and circuits.

The knowledge and skills shall be contextualised to current industry standards, technologies and practices.

KS01-EG033A **Electrical apparatus and circuits**

Evidence shall show an understanding of electrical apparatus and circuits to an extent indicated by the following aspects:

T1 Lighting circuits – looping at the light/switch encompassing:

- the “loop at the light” method of wiring lighting circuits.
- the “loop at the switch” method of wiring lighting circuits
- wiring diagrams for the lighting circuit of an installation that incorporates one-way, two-way and two-way and intermediate switching of light points using the loop at the light/switch methods of TPS wiring.
- TPS cabling requirement for the loop at the light/switch circuit.
- installation methods of accessories and wiring for a lighting circuit incorporating one-way, two-way and two-way and intermediate switching of lighting points using the loop at the light/switch method of TPS wiring.
- correct operation of the install circuits including testing for correct compliance with Australian Standards.

T2 Circuits for socket outlets encompassing:

- the purpose of socket outlets.
- requirements concerning the polarity of switched socket outlets.
- correct cable size to supply 10 A, 15 A and 20 A socket outlets (single and three phase), for given installation conditions.
- number of socket outlets connected to a 16 A and 20 A circuit breaker.
- installation methods of a single phase socket outlet circuits.
- correct operation of the installed circuits including testing (dead testing only) for correct compliance with Australian Standards.

T3 Final sub-circuits and segregation encompassing:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- purpose of mixed circuits.
- circuit loading for a mixed circuit.
- purpose of segregation of circuits and the AS/NZS3000 requirements.
- Installation methods a single phase mixed circuits.
- correct operation of the installed circuits including testing for correct compliance with Australian Standards.

T4 Electrical heating control devices encompassing:

- methods of manual heat control.
- methods of automatic heat control.
- types and application for common thermostats.
- operation of common thermostats.
- sensitivity and differential of thermostats.
- testing of a thermostat (including differential and correct operation)
- applications of simmerstats (infinite controls).
- operation of a simmerstat.
- electronic heat control (phase control and zero voltage switching).

T5 Fixed electrical heating appliances encompassing:

- Terms: heat energy, temperature, specific heat capacity, thermal conductivity and thermal stability.
- determining the heat energy in joules and kWh in a simple heating process.
- methods of heat transfer.
- Determining the heat energy input and output of a heating process.
- connections to a two phase stove.
- operation of reverse cycle air conditioning.

T6 Electrical water heater operation encompassing:

- types of water heaters (instantaneous and storage) and their methods of control.
- intrinsic safety (pressure relief and thermal cut-out).
- testing of over temperature cut-out point of a thermostat.
- switchboard requirements to supply a controlled load water heater.
- internal circuit of a twin element water heater, and supply connections.
- tariffs employed by local supply authorities.
- solar heating system and its integration into an installation.

T7 Alternative supplies encompassing:

- reasons for the installation of alternative supplies.
- types of alternative supply systems.
- characteristics and operation of UPSs.
- Australian Standards and local requirements for safety services supply systems.

T8 Installation of batteries encompassing:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- common types of primary cells and secondary batteries and typical applications.
- terminal voltage of common primary cells and secondary cells.
- correct storage, handling and disposal techniques for cells and batteries.
- charge/discharge cycle for a secondary cell.
- effect of internal resistance on a secondary cell.
- state of charge of a secondary cell.
- installation of batteries as per AS/NZS3011
- commissioning procedures for various secondary batteries.
- safe working procedures when working with secondary cells and batteries.

T9 Fire protection – residential fire and smoke alarms encompassing:

- types of fire and smoke alarms.
- regulations and standards requirements regarding residential fire and smoke alarms.
- locations for residential fire and smoke alarms.
- wiring methods for residential fire and smoke alarms.
- operation of typical residential fire and smoke alarms

T10 Emergency and evacuation lighting and lighting control encompassing:

- factors and requirements of emergency and evacuation lighting concerning illumination levels, luminaire positioning and operating period.
- characteristics of maintained, non maintained and sustained emergency lighting systems.
- arrangement of batteries in point and central bank emergency lighting supply systems.
- lighting control methods

T11 Lighting concepts and incandescent lighting encompassing:

- basic concepts of lighting.
- terminology, principles and standards relevant to lighting (energy efficiency as per BCA new lamp types and permitted replacements and their efficacy)..
- basic types of luminaries.
- operation of an incandescent lamp.
- types of incandescent lamps.
- expected lamp life, colour rendering and efficacy for typical incandescent lamps.
- lighting layout in terms of visual comfort and relevant Australian standards

T12 Fluorescent low intensity discharge lighting encompassing:

- types of low intensity discharge lamps.
- expected lamp life, colour rendering and efficacy for typical types of low intensity discharge lamps.
- operation of low intensity discharge luminaires including their control equipment.
- Australian Standard and local requirements for low intensity discharge lighting.
- methods for satisfying Australian Standards and local supply authority requirements

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

regarding low intensity discharge lighting.

T13 High intensity discharge lighting encompassing:

- types of high intensity discharge lamps.
- expected lamp life, colour rendering and efficacy for typical types of high intensity discharge lamps.
- operation of high intensity discharge luminaires including their control equipment.
- Australian Standard and local requirements for high intensity discharge lighting.
- methods for satisfying Australian Standards and local supply authority requirements regarding high intensity discharge lighting.
- LED lighting and its applications.
- Neon, Argon and Xenon lighting and their applications.
- comparison of incandescent, low intensity discharge, high intensity discharge, LED and other types of lighting

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.1)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the

EVIDENCE GUIDE

- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Solve problems in single and three phase low voltage electrical apparatus and circuits as described as described in 8) and including:

A Determining the operating parameters of existing apparatus/circuits.

B Altering an existing apparatus/circuit to comply with specified operating parameters.

C Developing apparatus/circuits to comply with a specified function and operating parameters.

D Determining the cause of low efficiency in an existing apparatus/circuit.

E Determining conditions causing an existing apparatus/circuit to be unsafe.

F Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to solving problems in electromagnetic circuits.

Licensing/Regulatory Information

1.2) License to practice

The application of the skills and knowledge described in this unit require a license to practice in the workplace where work is carried out on electrical equipment or installations which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

© Commonwealth of Australia, 2025 Powering Skills Organisation

1.2) License to practice

Practice in workplace and during training is also subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

Note:
1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.
2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting and risk safety measures.

Pre-Requisites

Prerequisite Unit(s) **2)**

2.1) Competencies

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle, assemble of electrotechnology components
UEENEEE104A	Solve problems in d.c circuits
UEENEEE105A	Fix and secure electrotechnolgy equipment

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to arrange electrical installations circuits, control and protection	1.1 The extent and nature of the electrical installation is determined from job specifications.
	1.2 Safety and other regulatory requirements to which the electrical installation shall comply are identified, obtained and understood.
	1.3 Load requirements for individual current-using equipment is determined from job specifications or from consultation with appropriate persons.
2 Arrange electrical installations circuits, control and protection	2.1 Circuits, control and protective devices are arranged to ensure safe and functional operation of the installation and to comply with technical standards and job specifications and requirements.
	2.2 Earthing is arranged and terminated to comply with the MEN system requirements.
	2.3 Protective devices are selected to meet the required switching and tripping currents, co-ordination and discrimination for overload and short-circuit protection.
	2.4 Residual current devices are selected to meet the required circuit, switching and tripping currents required.
	2.5 Switchgear/control gear is selected to meet current, voltage and IP ratings and functional requirements.
	2.6 Switchboards are arranged to accommodate control and protective devices, links, safety services, and other distributor equipment in accordance with requirements.
3 Document electrical installation circuits, control and protection arrangements	3.1 Evidence is obtained from manufacturers/suppliers that electrical equipment selected complies with safety requirements.
	3.2 Reasons for selections made, including calculations, are documented in accordance with established procedures.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA
	3.3 Electrical installation arrangement and specifications for all selected items are documented in accordance with established procedures and forwarded to appropriate person(s).

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

7) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of arranging electrical installations circuits, control and protection.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG063A Electrical installations — arrangement, control and protection

Evidence shall show an understanding of circuit arrangements, control and protection of electrical installations that comply with the Wiring Rules and Service Rules to an extent indicated by the following aspects:

T1 Safety principles to which electrical systems in building and premises shall comply.

- Safety principles are given in Part1 (Section 1) of the Wiring Rules AS/NZS 3000 with deemed-to-comply requirements given in Sections 2 to 8.
- Compliant methods for providing protection - include those for providing protection against direct and indirect contact; thermal effects; unwanted voltages; overcurrent; fault currents; overload; overvoltage; injury from mechanical movement.
- Requirements for installation design and selection of equipment - includes compliant protection arrangements; correct functioning; compatibility with supply; estimation of maximum demands; voltage drop considerations; arrangement of circuits and the like

T2 Circuit and control arrangements encompassing:

- reason for dividing electrical installations into circuits
- factors that shall be considered in determining the number and type of circuits required for an installation.
- daily and seasonal demand for lighting power, heating and other loads in a given installation.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- number and types of circuits required for a particular installation.
- diagrams/schedules of circuits for given installations.
- application and arrangements of SELV and PELV circuits
- application and arrangement of an isolated supply

T3 Hazards and risks in an electrical installation encompassing:

- effects on the human body of various levels of a.c. and d.c. current and duration of current flow for various current paths.
- risk of ignition of flammable materials due the thermal effects of current or electric arcs in normal service of an electrical installation.
- risk of injury from mechanical movement of electrically actuated equipment.
- Protection against direct contact (basic protection)
- acceptable methods
- use of extra-low voltage

T4 Protection against indirect contact encompassing:

- indirect contact with live parts of an electrical installation may occur.
- methods and devices that comply with the Wiring Rules for providing protection against indirect contact.
- components of the 'automatic disconnection of supply' method of protection against indirect contact.
- the terms ‘touch voltage’ and ‘touch current’.
- the current path when a short circuit fault to exposed conductive parts of an appliance occurs.
- protection against indirect contact is by the use of Class II equipment and by electrical separation.
- additional protection by use of Residual Current Devices (RCDs)
- protection against indirect contact by use of extra-low voltage and electrical separation.
- Protection requirements for damp situations.

T5 Earthing encompassing:

- the terms: earthed, earthed situation, earth electrode, equipotential bonding, multiple earthed neutral (MEN) system, protective earth-neutral (PEN) conductor, main earthing conductor, protective earthing (PE) conductor, functional earthing, MEN link.
- selection of minimum size-earthing conductor for a range of active conductor sizes and materials.
- parts of an earthing system and the purpose of each.
- typical arrangement for a MEN earthing system.
- arrangements of protective earthing conductors that comply with the Wiring Rules.
- requirements for equipotential bonding in a range of installation situations.
- Installation of a MEN earthing system for a single phase installation

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T6 Protection against overload and short circuit current encompassing:

- overload current or fault currents in an electrical installation.
- equivalent circuit of an earth fault-loop
- level of fault current possible at a given point in an installation from the fault-loop impedance and data from the electricity distributor.
- methods and devices that comply with the Wiring Rules AS/NZS 3000 for providing protection against the damaging effects of overload and fault current
- requirements for co-ordination between protective devices and conductors
- requirements for co-ordination of protection devices for discrimination and back-up protection.

T7 Devices for automatic disconnection of supply encompassing:

- operating principles of thermal/magnet circuit breakers.
- operating principles of common types of fuses.
- operating principles of residual current devices (RCD).
- time/current curves tripping characteristics of various types of circuit breakers that comply with the requirements of the Wiring Rules.
- time/current curves fusing characteristics of various types of fuses that comply with the requirements of the Wiring Rules.
- time/current curves tripping characteristics of various types of RCDs that comply with the requirements of the Wiring Rules.
- factors in a fault loop that will affect the impedance of the circuit.
- maximum impedance of an earth fault-loop to ensure operating of a protection device.
- selecting a fuse for fault current limiting protection.
- drawing switchboard wiring arrangements of 2-pole RCDs, 4-pole RCDs, combination RCD/MCBs.

T8 Protection against over voltage and under voltage encompassing:

- causes of over voltage and how this may affect the electrical system.
- methods for protection against over voltage.
- causes of under voltage and how this may affect the electrical system.
- methods for protection against under voltage.

T9 Control of an electrical installation and circuits encompassing:

- switch types, current and voltage ratings and IP rating and where these apply.
- switching requirements for isolation, emergency, mechanical maintenance and functional control.
- control arrangement for complete installations with and without safety services and an alternative supply.

T10 Switchboards / distribution boards encompassing:

- Purpose, types and applications.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Physical and circuit arrangements for whole current and CT metering.
- Physical and circuit arrangements of main switches, circuit protection devices, fault-current limiters and metering equipment and other distributor equipment.
- compliance requirements (includes location and access, arc fault protection, identification, construction suitability, equipment marking, wiring, fire protection and arc-fault protection).

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.1)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines - UEE07'. Evidence shall also comprise:

- A representative body of performance criteria demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - arranging electrical installations circuits, control and protection as described as described in 8) and including:

    A Determining the extent and nature of the installation for

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

job specifications

B Obtaining and understand the safety and other regulatory requirements to which the electrical installation shall comply

C Determining individual load requirements.

D Arranging and terminate circuits, control and protective devices to comply with all requirements

E Selecting circuit protective devices residual current device that comply with all requirements.

F Selecting switchgear and control gear that meet current, voltage and IP ratings and functional requirements.

G Obtaining evidence of compliance for the equipment selected

H Documenting installation arrangement, specification for items selected and reasons for the selections made.

I Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to arranging circuits, control and protection for general electrical installations.

Method of

9.4)

EVIDENCE GUIDE

assessment	This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'. Note: Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.
Concurrent assessment and relationship with other units	**9.5**) For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit: UEENEEG107A Select wiring systems and cables for low voltage general electrical installations

Range Statement

RANGE STATEMENT

8) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to arranging of circuits, control and protection for at least two general electrical installations comprising a main switchboard, supplying more than one circuit each for, lighting, socket outlets, and fixed appliances. One of the installations shall include a distribution board separate from the main switchboard and at least one circuit supplying a three-phase load and a fire pump.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1**)

1.1) **Descriptor**

This unit covers determining correct operation of electromagnetic devices and related circuits and providing solutions as they apply to electrical installations and equipment. It encompasses working safely, power circuit problems solving processes, including the use of voltage, current and resistance measuring devices, providing solutions derived from measurements and calculations to predictable problems in electromagnetic devices and related circuits.

Application of the Unit

Not Applicable

Licensing/Regulatory Information

1.2) **License to practice**

During Training: Competency development activities are subject to regulations directly related to licencing, occupational health and safety and where applicable contracts of training such as apprenticeships.

In the workplace: The application of the skills and knowledge described in this unit require a license to practice in the workplace where work is carried out on electrical equipment or installations which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

Other conditions may apply under State and Territory legislative and regulatory requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe
the essential outcomes
of a unit of competency

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Prepare to work on electromagnetic devices and circuits.	1.1	OHS procedures for a given work area are identified, obtained and understood.
		1.2	OHS risk control work preparation measures and procedures are followed.
		1.3	The nature of the device(s)/circuit(s) problem is obtained from documentation or from work supervisor to establish the scope of work to be undertaken.
		1.4	Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
		1.5	Sources of materials that may be required for the work are established in accordance with established procedures.
		1.6	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2	Solve electromagnetic devices/circuit problems.	2.1	OHS risk control work measures and procedures are followed.
		2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
		2.3	Circuits are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
		2.4	Established methods are used to solving circuit problems from measure and calculated values as they apply to electromagnetic devices/circuits.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	2.5	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.6	Problems are solved without damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practices.
3 Complete work and document problem solving activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Justification for solutions used to solve circuit problems is documented.
	3.4	Work completion is documented and an appropriate person or persons notified in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

7) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and solving problems in electromagnetic devices and related circuits.

The knowledge and skills shall be contextualised to current industry standards, technologies and practices.

KS01-EG101A Electromagnetic devices and circuits

Evidence shall show an understanding of electromagnetic devices and circuits to an extent indicated by the following aspects:

T1 Magnetism encompassing:

- magnetic field pattern of bar and horse-shoe magnets.
- magnets attraction and repulsion when brought in contact with each other.
- common magnetic and non-magnetic materials and groupings (diamagnetic, paramagnetic and ferromagnetic materials).
- principle of magnetic screening (shielding) and its applications.
- practical applications of magnets

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- construction, operation and applications of reed switches.

T2 Electromagnetism encompassing:

- conventions representing direction of current flow in a conductor.
- magnetic field pattern around a single conductor and two adjacent conductors carrying current.
- Using the “right hand rule” to determine the direction of magnetic field around a current carrying conductor.
- direction of force between adjacent current carrying conductors.
- effect of current, length and distance apart on the force between conductors (including forces on bus bars during fault conditions).
- magnetic field around an electromagnet.
- Using the “right hand rule” to determine the direction of magnetic field around a current carrying coil.
- magnetomotive force (m.m.f.) and its relationship to the number of turns in a coil and the current flowing in the coil.
- practical applications of electromagnets.

T3 Magnetic circuits encompassing:

- magnetic characteristic curve for various materials and identify the various regions.
- Identify the various conditions of a magnetic material from its Hysteresis loop.
- factors which determine losses in magnetic material.
- methods used to reduce electrical losses in a magnetic circuit.
- magnetic flux (definition, unit and symbol).
- reluctance as the opposition to the establishment of magnetic flux.
- permeability (definition, symbol and unit).
- difference for magnetic and non-magnetic materials in regards to reluctance and permeability.
- calculation of m.m.f., flux or reluctance given any two values.
- flux density (definition, symbol, unit and calculation).
- magnetising force (definition, symbol, unit and calculation).
- common magnetic circuit types.
- effect of an air gap in a magnetic circuit.
- terms “magnetic leakage” and “magnetic fringing”.

T4 Electromagnetic induction encompassing:

- principle of electromagnetic induction (Faraday’s law of electromagnetic induction).
- applying “Fleming’s right hand rule” to a current a carrying conductor under the influence of a magnetic field.
- calculation of induced e.m.f. in a conductor given the conductor length, flux density and velocity of the conductor.
- calculation of induced e.m.f. in a coil given the number of turns in a coil and the rate of change of flux.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- calculation of force on a conductor given the flux density of the magnetic field, length of the conductor and the current being carried by the conductor.
- Lenz's law
- applications of electromagnetic induction

T5 Inductance encompassing:

- construction of an inductor, including a bifilar winding inductor.
- Australian Standard circuit diagram symbol for the four types of inductor.
- effect of physical parameters on the inductance of an inductor.
- common types of inductor cores.
- applications of the different types of inductors.
- definition of terms self induction, inductance and mutual inductance.
- calculation of value of self induced e.m.f. in a coil.
- mutual induction occurs between two coils.
- graphical relationship between load voltage, current and self induced e.m.f. in a single d.c. circuit having inductance.
- practical applications for the effects of self and mutual induction.
- undesirable effects of self and mutual induction.
- definition of term "time constant" and draw the characteristic curve as applied to a series circuit containing an inductor and a resistor. (LR circuit)Calculation of value of the time constant for an LR circuit given the values of the components.
- time constants required for the current in an LR circuit to reach its final value.
- determining of instantaneous values of voltage and current in an LR circuit using a universal time constant chart.

T6 Measurement Instruments encompassing:

- moving coil, moving iron, dynamometer meter movements and clamp testers.
- practical applications for moving coil, moving iron and dynamometer meter movements.
- Calculation of resistance of shunts and multipliers to extend the range of ammeters and voltmeters.
- factors to be considered in selecting meters for a particular application.
- safety category of meters and their associated applications.
- steps and procedures for the safe use, care and storage of electrical instruments.

T7 Magnetic devices encompassing:

- construction, operation and applications of relays.
- construction, operation and applications of contactors.
- magnetic methods used to extinguish the arc between opening contacts.
- construction, operation and applications of Hall Effect devices.
- operation and applications of magnetostriction equipment.
- construction, operation and application of magnetic sensing devices.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T8 Machine principles encompassing:

- basic operating principle of a generator.
- applying Fleming's right hand rule for generators.
- basic operating principle of a motor.
- applying Fleming's left hand rule for motors.
- calculation of force and torque developed by a motor.

T9 Rotating machine construction, testing and maintenance encompassing:

- components of a d.c. machine.
- difference between a generator and a motor in terms of energy conversion.
- nameplate of a machine.
- using electrical equipment to make electrical measurements and comparison of readings with nameplate ratings.
- Identification of faults in a machine from electrical measurements.
- care and maintenance processes for rotating machines
- safety risks associated with using rotating machinery.

T10 Generators encompassing:

- basic operation of a d.c generator.
- calculation of generated and terminal voltage of a d.c. shunt generator
- prime movers, energy sources and energy flow used to generate electricity.
- types of d.c. generators and their applications.
- methods of excitation used for d.c generators.
- equivalent circuit for a d.c. generator.
- importance of residual magnetism for a self excited generator.
- open circuit characteristics of d.c. generators.
- load characteristics of a d.c generator.
- reversing the polarity of a d.c. generator
- Connect and test a d.c generator on no-load and load
- Identify safety risks associated with using generators.

T11 Motors encompassing:

- operation of a motor and its energy flow.
- effect of back e.m.f. in d.c. motors
- torque as the product of the force on the conductors and the radius of the armature/rotor.
- types of d.c. motors and their applications.
- circuit diagrams for the types of d.c. motors.
- equivalent circuit for the types of d.c. motors.
- calculation of power output of a motor.
- characteristics of the different types of d.c. motors.
- connection and testing a d.c. shunt motor on no-load and load

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- reversing the direction of rotation of a d.c. motor.
- safety risks associated with using motors (include risks of series d.c. motors).

T12 Machine efficiency encompassing:

- losses that occur in a d.c machine.
- methods used to determine the losses in a d.c. machine.
- calculation of losses and efficiency of a d.c machine.
- efficiency characteristic of a d.c. machine and the conditions for maximum efficiency.
- application of Minimum Energy Performance standards (MEPS).
- methods used to maintain high efficiency.

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.1)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

EVIDENCE GUIDE

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines - UEE07'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

- Solve problems in electromagnetic circuits as described as described in 8) and including:

A Using methodological techniques to solve problems in circuits with an electromagnetic device from measure and calculated values

B Determining the operating parameters of an existing circuit with an electromagnetic device.

C Alternating an existing circuit with an electromagnetic device to comply with specified operating parameters.

D Developing circuits with electromagnetic devices to comply with a specified function and operating parameters.

E Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to solving problems in electromagnetic devices and related circuits.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires

ELEMENT	PERFORMANCE CRITERIA	
	2.4	Established methods are used to solve circuit problems from measure and calculated values as they apply to single and three-phase low voltage circuit.
	2.5	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.6	Problems are solved without damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practices.
3 Complete work and document problem solving activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Justification for solutions used to solve circuit problems is documented.
	3.4	Work completion is documented and an appropriate person or persons notified in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

7) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and Solving single and three phase low voltage circuit problems.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG102A Alternating current power circuits

Evidence shall show an understanding of alternating currents power circuits to an extent indicated by the following aspects:

T1 Alternating Current Quantities encompassing:

- sine, cosine and tangent ratios of a right angle triangle
- Pythagoras Theorem to a right angle triangle.
- use of the CRO to measure d.c. and a.c. voltage levels

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- sinusoidal voltage generated by a single turn coil rotated in a uniform magnetic fields
- terms 'period', 'maximum value', 'peak-to-peak value', 'instantaneous value', 'average value', 'root-mean-square (r.m.s.) value', in relation to a sinusoidal waveform.
- calculation of the instantaneous value of induced voltage of a generated sinusoidal waveform.
- measurement of instantaneous, peak, peak-to-peak values and the period of a sinusoidal waveform.
- calculation of root-mean-square (r.m.s.) value and frequency of a sinusoidal waveform from values of peak voltage and period.

T2 Phasors Diagrams encompassing:

- purpose of phasor diagrams
- 'in-phase', 'out-of-phase', 'phase angle'' lead' and 'lag'.
- phase angle between two or more alternating quantities from a given sinusoidal waveform diagram.
- convention for representing voltage, current and the reference quantity in a phasor diagram.
- drawing phasor diagrams to show the relationship between two or more a.c. values of voltage and/or current.
- determination of phase relationship between two or more sinusoidal waveforms from a given diagram and measurements.

T3 Single Element a.c. circuits encompassing:

- setting up and connect a single-source resistive a.c. circuit and take voltage and current measurements to determine the resistance
- determining the voltage, current resistances from measure of given values of any tow of these qualities.
- relationship between voltage drops and current in resistive a.c. circuit
- applications of resistive a.c. circuits
- defining ‘inductive reactance’.
- calculation of inductive reactance for a given inductor and the relationship between inductive reactance and frequency.
- applying Ohm’s Law to determine voltage, current of inductive reactance in a purely inductive a.c. circuit given any two to these quantities.
- applications of inductive a.c circuits.
- calculation of capacitive reactance
- applying Ohm’s Law to determine voltage, current or capacitive reactance in a purely capacitive a.c circuit given any two of the quantities.
- applications of capacitive a.c circuits

T4 RC and RL Series a.c. circuits encompassing:

- impedance and impedance triangle.
- determining the impedance, current and voltages for a series RC circuit given the resistance, capacitance and supply voltage.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- drawing and labelling the impedance triangle for a series RC circuit
- drawing phasor diagrams for a series RC circuit
- AS/NZS 3000 requirements for the installation of capacitors.
- examples of capacitive components in power circuits and systems and the effect on the phase relationship between voltage and current.
- determining the impedance, current and voltages for a series RL circuit given the resistance, inductance and supply voltage.
- drawing and labelling the impedance triangle for a series RL circuit
- drawing the equivalent circuit of a practical inductor
- Draw phasor diagrams for a series RL circuit.
- examples of inductive components in power circuits and systems and describe their effect on the phase relationship between voltage and current

T5 RLC Series a.c. circuits encompassing:

- measuring component voltages in a series RLC circuit and using a phasor diagram to determine the supply voltage and phase angle between circuit voltage and circuit current.
- determining the impedance, current and voltages for a series RLC circuit given resistance, inductance, capacitance and supply voltage.
- drawing and labelling the impedance triangle for a series RLC circuit.
- calculation of total impedance for a series RLC circuit.
- calculation of voltage drop for cables using the values for reactance and a.c. resistance from AS/NZS 3008.
- comparison of current limiting characteristics of inductors and resistors.
- practical examples of RLC series circuits

T6 Parallel a.c. Circuits encompassing:

- determining the branch currents of a parallel circuit that contain RL, RC or LC in two branches.
- using a phasor diagram to determine the total circuit current and phase angle in parallel RL, RC or LC circuits.
- determining the total circuit impedance of parallel RL, RC or LC circuits.
- measuring the branch currents in a parallel RLC circuit and use a phasor diagram to determine the total current and phase angle between circuit voltage and circuit current.
- determining the branch impedances, branch currents and phase angles voltages for a parallel RLC circuit given resistance, inductance, capacitance and supply voltage.
- calculation of impedance for a parallel RLC circuit.
- practical examples of parallel circuits.

T7 Power in an a.c. circuit encompassing:

- difference between true power, apparent power and reactive power and the units in which these quantities are measured.
- drawing the power triangle to show the relationships between true power, apparent

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

power and reactive power
- defining the term "power factor" and phase angle.
- methods used to measure single phase power, energy and demand.

T8 Power Factor Improvement encompassing:

- effects of low power factor.
- requirements for power factor improvement.
- methods used to improve low power factor of an installation.
- local supply authority and AS/NZS 3000 wiring rules requirements regarding the power factor of an installation and power factor improvement equipment.
- methods used to measure single phase power factor.
- using manufacturers catalogues to select power factor equipment for a particular installation

T9 Harmonics and Resonance Effect in a.c. Systems encompassing:

- term "harmonic" in relation to the sinusoidal waveform of an a.c. power system.
- sources in a.c. systems that produce harmonics.
- problems that may arise in a.c. circuits as a result of harmonics and how these are overcome.
- methods and test equipment used to test for harmonics
- methods used to reduce harmonics in a.c. power system
- conditions in a series a.c. circuit that produce resonance.
- dangers of series resonance circuits
- conditions in a parallel a.c. circuit that produce resonance.
- dangers of parallel resonance circuits
- AS/NZS3000 and the local supply authority requirements concerning harmonics and resonance effect in a.c. power systems.

T10 Three Phase Systems encompassing:

- features of a multiphase system.
- comparison of voltages generated by single and multiphase alternators.
- reasons for the adoption of three phases for power systems.
- how three phases is generated in a single alternator.
- Calculation of r.m.s. value of voltage generated in each phase given the maximum value.
- relationship between the phase voltages generated in a three phase alternator and the conventions for identifying each.
- term "phase sequence" (also, referred to as "phase rotation").
- determining the phase sequence of a three phase supply

T11 Three phase star-connections encompassing:

- connecting a three phase star-connection load.
- phase relationship between line and phase voltages and line and phase currents of a

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

star-connected system.
- determining the r.m.s. value of line and phase voltage given any one of these quantities.
- determining the r.m.s. value of line and phase current given any one of these quantities.
- terms "balanced load" and "unbalanced load".
- effect of a reversed phase winding of a star connected alternator.
- example of balanced and unbalanced loads in typical power systems.

T12 Three phase four wire systems encompassing:

- purpose of the neutral conductor in a three phase four wire systems.
- determining the effects of an high impedance in the neutral conductor of a three phase four wire system supplying an unbalanced load where MEN earthing is employed.
- determining the value and phase relationship of neutral current in an unbalanced three phase four wire systems given line currents and power factors.
- AS/NZS 3000 requirements regarding neutral conductors.
- AS/NZS 3008.1.1 method for determining voltage drop in unbalanced three phase circuits

T13 Three phase delta-connections and Interconnected systems encompassing:

- connecting three phase delta loads.
- phase relationship between line and phase voltages and line and phase currents of a delta-connected system.
- determining the r.m.s. value of line and phase voltage given any one of these quantities.
- determining the r.m.s. value of line and phase current given any one of these quantities.
- limitations and uses of open delta connections
- effect of a reversed phase winding of a delta connected transformer
- example of loads in typical power systems.
- drawing the typical combinations of three phase interconnected systems using star-connections and a delta-connection.
- relationship between line and phase voltages and line and phase currents in the typical interconnected systems using star-connections and delta-connections.

T14 Energy and power requirements of a.c. systems encompassing:

- purposes for measuring power, energy, power factor and maximum demand of a.c. power systems and loads.
- difference between true power, apparent power and reactive power and the units in which these quantities are measured in a three phase system.
- drawing the power triangle to show the relationships between true power, apparent power and reactive power in a three phase system.
- methods used to measure three phase power , energy, power factor and demand.
- determining how the power factor of a three phase installation can be improved.
- using manufacturers catalogues to select measurement equipment for a particular installation

T15 Fault Loop Impedance encompassing:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- term fault loop impedance of a a.c. power system
- determining fault loop impedance using resistance and reactance values from AS/NZS 3008.1.1
- measuring fault loop impedance of typical circuits
- procedures for testing fault loop impedance

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.1)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines - UEE07'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Solve problems in single and three phase circuits as described as described in 8) and including:

    A Using methodological techniques to solve problems in circuits in a.c. circuits from measure and calculated values

    B Determining the operating parameters of existing circuits

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

C Altering an existing circuit to comply with specified operating parameters.

D Developing circuits to comply with a specified function and operating parameters.

E Determining the cause of low power factor in an existing circuit.

F Determining conditions causing an existing circuit to be unsafe.

G Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to solving single and three phase low voltage circuit problems.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note: Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent

9.5)

EVIDENCE GUIDE

assessment and relationship with other units	For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

Range Statement

RANGE STATEMENT

8) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to solving problems in a.c. circuit by:

- Determining the operating parameters of existing circuits
- Altering an existing circuit to comply with specified operating parameters
- Developing circuits to comply with a specified function and operating parameters of voltage, current, impedance, power and power factor
- Determining the cause of low power factor in an existing circuit.
- Determining conditions causing an existing circuit to be unsafe includes electric shock hazard from indirect contract with conductive parts, insufficiently low impedance of a fault current path and inadequate fault protection.

In relation to the following on more than one occasions:

Single phase circuits

- Connecting single-phase circuits
- Choosing correct instruments
- Taking measurements correctly and accurately.

Three-phase circuits

- Connecting three-phase circuits
- Choosing correct instruments
- Taking measurements correctly and accurately.

AND

At least four of the following applications

- Series a.c. circuits
- Parallel a.c. circuits

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

- Series / parallel a.c. circuits
- Single phase motors / controls
- Three phase motors / controls
- Synchronous machines
- Transformers / Auxiliary components
- Star connected circuits
- Delta connected circuits
- Star-Delta interconnected circuits
- Open Delta circuits

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1**)

1.1) **Descriptor**

This unit covers the termination of cables and cords and their conductors at accessories and current-using devices designed to operate at voltages up to 1,000 V a.c. or 1,500 V d.c. It encompasses working safely and to standards, understanding wiring system and cable types and applications, selecting appropriate termination accessories, preparing and terminating cables and cords, terminating cables/cord conductors and ensuring completed termination complies with requirements.

Application of the Unit

Not Applicable

Licensing/Regulatory Information

1.2) License to practice

During Training: Competency development activities are subject to regulations directly related to licensing, occupational health and safety and where applicable contracts of training such as apprenticeships.

In the workplace: The application of the skills and knowledge described in this unit require a license to practice in the workplace where work is carried out on electrical equipment or installations which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

Other conditions may apply under State and Territory legislative and regulatory requirements.

Pre-Requisites

Prerequisite Unit(s) **2)**

2.1) Competencies

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, assemble and dismantle utilities industry components
UEENEEE105A	Fix and secure electrotechnology equipment
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications

Employability Skills Information

Employability Skills **3)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Application of the Unit **4)**

4.1) General Application

This unit applies to competency development entry-level employment based programs incorporated in approved contracts of training.

4.2) Importation

RTOs wishing to import this unit into any qualification under the flexibility provisions of NQC Training Package Policy

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a unit of competency

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to terminate cables, cords and conductors	1.1 OHS procedures for a given work area are identified, obtained and understood.
	1.2 Health and safety risks are identified and established risk control measures and procedures in preparation for the work are followed.
	1.3 Safety hazards that have not previously been identified are noted and established risk control measures are implemented.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT		PERFORMANCE CRITERIA	
		1.4	The junction box/ terminal enclosures and terminal types are inspected to select the type and size of cable and conductor termination devices needed.
		1.5	Tools, materials and testing devices needed to for terminating cables and cords are obtained in accordance with established procedures and checked for correct operation and safety.
2	Terminate cables, cords and conductors	2.1	OHS risk control measures and procedures for carrying out the work are followed.
		2.2	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
		2.3	Cable/cord ends are cut and sheath/insulation stripped with sufficient length to prevent stain on terminations and without undue waste.
		2.4	Cable glands/retaining devices are fitted and secured to ensure cable/cord cannot be pulled out of entry into junction box/ terminal enclosure
.		2.5	Conductors are prepared to suit the type of terminal at which there are to be connected.
		2.6	Conductors are terminated to ensure continuity across the terminal.
		2.7	Established methods for dealing with unexpected situations are discussed with appropriate person or persons and documented.
		2.8	Unexpected situations are dealt with safely and with the approval of an authorised person.
3	Test terminated cables and cords	3.1	OHS work completion risk control measures and procedures are followed.
		3.2	Terminated cables are tested to ensure continuity and insulation resistance comply with requirements.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

7) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and terminating cables, cords and accessories for low voltage circuits.

The knowledge and skills shall be contextualised to current industry standards, technologies and practices.

KS01-EG106A Wiring systems types, application and terminations

Evidence shall show an understanding of wiring systems types, application and terminations to an extent indicated by the following aspects:

T1 Cable types and terminations encompassing:

- cable variates (single cables, flexible cables, flexible cords, shielded cables, armoured cables, ribbon cables, other similar and like cables)
- structural components of cables and their purpose (conductor material, stranding, insulation type, voltage rating, screening, sheathing, armour and serving)
- Australian and International colour standards for cords and cables
- construction of common cables
- identification of cords and cables by conductor size, type and rating
- application of various cords and cables types
- identification of hardware used in terminating cords and cables
- preparation and termination of cords and cables
- termination of cords and cables using crimp lugs, tunnel connectors, soldering and solderless lugs
- requirements to protect and support cables adequately (protection against mechanical damage, protection from adverse temperatures and corrosion and protection from magnetic field that may affect the performance of the cable).

T2 Cords, cables and plugs encompassing:

- selection of flexible cords for given applications
- preparation of cord ends for connection
- fitting standard three pin plug tops to a flexible cords
- fitting standard three pin extension sockets to a flexible cords
- connecting variety of plugs to different flexible cord types
- requirements of AS/NZS 3000 for flexible cords, cables and plugs
- using test equipment to test and locate various faults in flexible cords and cables.

T3 Flat TPS wiring systems encompassing:

- Australian Standards requirements for the termination and protection of flat TPS cable

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Installation of flat TPS cable in trunking and duct for the supply of socket outlets
- using flat TPS cable for lighting looms
- testing circuits to ensure they are safe and operate as intended

T4 Circular TPS wiring systems encompassing:

- Australian Standards requirements for the installation of circular TPS cable
- installation of circular TPS cables on cable ladder/tray
- installation of circular TPS cable
- testing circuits to ensure they are safe and operate as intended

T5 Thermoplastic insulated cables in non-metallic enclosures encompassing:

- Australian Standards requirements for the installation of non-metallic enclosures
- cutting and setting rigid non-metallic ducting, trunking and conduit and accessories
- installation of circuits using TPI cables in non-metallic enclosures
- testing circuits to ensure they are safe and operate as intended

T6 Thermoplastic insulated cables in metallic enclosures encompassing:

- Australian Standards requirements for the installation of metallic enclosures
- fitting metallic conduit to metallic trunking and accessories
- cutting, threading and setting metallic conduit
- installation of circuits using thermoplastic insulated cables in metallic conduit, ducting and trunking
- testing circuits to ensure they are safe and operate as intended

T7 Fire protection cabling and systems encompassing:

- Australian Standards requirements for the installation of fire protection cable and mineral insulated metal sheathed cables
- requirements when passing a wiring system through a fire rated wall or floor
- recognising different fire protection cable types including Pyrolex, Radox and MIMS
- termination of fire protection cable.
- installation of circuits using fire protection cable.
- testing circuits to ensure they are safe and operate as intended

T8 Steel wire armoured (SWA) cables encompassing:

- Australian Standards requirements for the installation of SWA cables
- identifying accessories used with SWA cables
- installation of circuits using SWA cables
- testing circuits to ensure they are safe and operate as intended

T9 Trailing cables and catenary systems encompassing:

- Australian Standards requirements for the installation of trailing cables and catenary wiring

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- identifying equipment used with trailing cable and catenary systems
- installation of catenary wiring systems
- installation of trailing cable systems supplying pendant sockets
- testing the installation to ensure it is safe and operates as intended

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.**1**)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines - UEE07'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

- Install wiring and accessories for low voltage circuits as described as described in 8) and including:

A Selecting appropriate cable/cord and conductor devices

B Cutting cable ends and stripping sheath/insulation to a sufficient length

C Fitting and securing cable glands/retaining devices correctly

D Preparing and terminating conducts to suit the type of terminal at which there are to be connected.

E Testing completed cables to ensure compliant continuity and insulation resistance

F Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to installing wiring and accessories for low voltage circuits.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Range Statement

RANGE STATEMENT

8) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated by terminating at least five different types of cables each at a junction box and a device terminal enclosure.

Cable types with copper conductors:

- Thermoplastic insulated cable (TPI)
- Flat thermoplastic sheathed (TPS)
- Circular thermoplastic sheathed (TPS)
- Steel wire armoured (SWA)
- Mineral insulated metal sheathed (MIMS)
- Flexible cables
- Flexible cords
- Aluminium conductor/cable

Unit Descriptor

Unit Descriptor **1**)

1.1) Descriptor

This unit covers trouble-shooting and repairing faults in electrical apparatus and interconnecting circuits and equipment operating at voltages up to 1,000 V a.c. or 1,500 V d.c. It encompasses working safely, reading circuit diagrams, sketching diagrams from traced wiring, logically applying fault finding procedures, conducting repairs and completing the necessary service documentation.

Application of the Unit

Not Applicable

Licensing/Regulatory Information

1.2) License to practice

During Training: Competency development activities are subject to regulations directly related to licensing, occupational health and safety and where applicable contracts of training such as apprenticeships.

In the workplace: The application of the skills and knowledge described in this unit require a license to practice in the workplace where work is carried out on electrical equipment or installations which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

Other conditions may apply under State and Territory legislative and regulatory requirements.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting of competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

Unit Code	Unit Title
UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle, assemble of utilities components
UEENEEE104A	Solve problems in d.c. Circuits
UEENEEE105A	Fix and secure electrotechnology equipment
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEG006A	Solve problems in single and three phase low voltage machines
UEENEEG033A	Solve problems in single and three phase electrical apparatus and circuits
UEENEEG063A	Arrange circuits, control and protection for general electrical installations
UEENEEG101A	Solve problems in electromagnetic devices and related circuits
UEENEEG102A	Solve problems in low voltage a.c. circuits
UEENEEG106A	Terminate cables, cords and accessories for low voltage circuits

2.2) Literacy and numeracy skills

© Commonwealth of Australia, 2025 Powering Skills Organisation

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 'Literacy and Numeracy'

Reading	4	Writing	4	Numeracy	4

Employability Skills Information

Employability Skills **3**)

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Application of the Unit **4**)

4.1) **General Application**

This unit applies to all qualifications, competencies and/or Skill Sets which require an electrical license.

4.2) **Importation**

RTOs wishing to import this unit into any qualification under the flexibility provisions of NQC Training Package Policy

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a unit of competency

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA	
1 Prepare to trouble-shoot and	1.1	The extent and nature of the electrical installation is determined from job

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
rectify faults.		specifications.
	1.2	Safety and other regulatory requirements to which the electrical installation shall comply area are identified, obtained and understood.
	1.3	OHS procedures for a given work area are identified, obtained and understood.
	1.4	OHS risk control measures and procedures in preparation for the work are followed.
	1.5	The likely extent of work to be undertaken is envisaged from fault/breakdown reports and/or discussions with appropriate person(s).
	1.6	Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
2 Trouble-shoot and repair faults.	2.1	OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Safety hazards resulting from the fault or breakdown are documented and risk control measures devised and implemented in consultation with appropriate personnel.
	2.5	Trouble-shooting is approached methodically drawing on knowledge of electrical circuits and apparatus using measured and calculated values of circuit/apparatus parameters.
	2.6	Circuit/apparatus components are dismantled where necessary and parts stored to protect them against loss or damage.
	2.7	Faulty circuits/components are rechecked and

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		their fault status and acquired.
	2.8	Materials/replacement parts required to rectify faults are sourced and obtained in accordance with established procedures.
	2.9	Effectiveness of the repair is tested in accordance with established procedures.
	2.10	Apparatus is reassembled, finally tested and prepared for return to service.
	2.11	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.12	Trouble-shooting and repair activities are carried out without damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practices.
3 Completion and report trouble-shoot and repair activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work area is cleaned and made safe in accordance with established procedures.
	3.3	Written justification is made for repairs to apparatus.
	3.4	Work completion is documented and an appropriate person or persons notified in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

7) This describes the essential skills and knowledge and their level, required for this unit.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

Evidence shall show that knowledge has been acquired of safe working practices and trouble-shooting and repairing faults in electrical apparatus and circuits.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG108A Electrical circuit and equipment faults and fault finding techniques

Evidence shall show an understanding of electrical circuit and equipment faults and fault finding techniques to an extent indicated by the following aspects:

T1 Troubleshooting concepts encompassing:

- need to understand the correct operation of a circuit or equipment, switching and control circuit arrangements.
- common faults with circuits and equipment including operator faults, incorrect connections, open-circuits, short-circuits, device faults (mechanical), supply faults.
- typical faults symptoms and their causes: operation of circuit protective device, appliance does not operate, single phase motor does not develop enough torque to drive the load, three phase motor does not develop enough torque to drive the load, motor overload trips
- factors to consider in clarifying the nature of a fault: initial fault report, confirmation of symptoms of the fault, comparison of symptoms with normal operation
- effect to cause reasoning — assumptions of possible causes
- methods for testing assumptions: visual inspection, component isolation, test equipment, sectional testing, split-half tests
- repairing the fault and the steps needed to ensure fault doesn’t re-occur
- dealing with intermittent faults (typical causes of intermittent faults are vibration, shock, changes in temperature and electromagnetic interference).
- final testing and re commissioning

T2 Troubleshooting water heater and appliance circuits/equipment encompassing:

- circuit diagrams of common single phase and three phase hot water systems
- single phase and three phase element resistance values (determined from measurement and calculation from power and voltage ratings)
- testing single and three phase elements for correct insulation resistance and continuity
- element replacement techniques
- operation of thermostats, thermal cut-outs and pressure relief valves, flow switches and checking sacrificial anodes
- locating faults in common single and three phase hot water systems
- repairing faulty water heating systems

T3 Troubleshooting electrical appliance circuits/equipment encompassing:

- circuit diagrams of common single phase and three phase appliances
- methods to determine the cause of an RCD operation

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- identification of appliances that is causing an RCD to trip
- testing single and three phase appliances for correct insulation resistance and continuity
- operation of appliances controls
- locating faults in common single and three phase appliances
- repairing faulty appliances

T4 Troubleshooting lighting circuits encompassing:

- circuit and wiring diagrams of common lighting circuits including single light controlled by a single switch, multiple lights controlled by a single switch, two and three way switching using the loop at the light method and the loop at the switch method.
- causes of wiring faults from supplied symptoms and circuit and/or wiring diagrams
- causes of faults in ELV lighting devices, include transformer (iron core or electronic), voltage drop, heat, over-voltage, poor connections, incompatible dimmers
- diagrams of a basic fluorescent light circuit including lamp, ballast and starter
- locating faults in fluorescent light circuits
- operation of a range of lighting control including passive infra-red (PIR), dimmers, photo electric or day-light switches and time clocks
- locating faults in lighting control circuits

T5 Troubleshooting single phase motor and control circuits encompassing:

- circuit diagrams of split phase, capacitor start, capacitor start capacitor run, universal and shaded pole single phase motors
- causes of single phase motor faults from supplied symptoms and circuit diagrams
- causes of electrical faults in single phase motors, include open and partially open circuit winding, short and partially short circuit winding, open circuit rotor, burnt out winding, coil shorted to frame.
- reasons for a thermal overload trip and how often they are to be reset before investigating a cause
- internal mechanical faults and their consequences, include bearings, fans, bent shaft, locked rotor, blocked air vents, centrifugal switches, environmental factors
- faults on driven loads and couplings and their consequences, include slipping belts, poorly aligned coupling (shims), vibration, loads bearing failing, load stalling.
- locating faults in single phase motors and their controls

T6 Troubleshooting three phase induction motor encompassing:

- circuit diagrams of three phase induction motors
- causes of three phase motor faults from supplied symptoms and circuit diagrams
- causes of electrical faults in three phase motors, include open and partially open circuit phase winding, short and partially short circuit phase winding, open circuit rotor, burnt out phase winding, coil shorted to frame.
- reasons for a thermal overload trip and how often they are to be reset before investigating a cause
- internal mechanical faults and their consequences, include bearings, fans, bent shaft, locked rotor, blocked air vents, environmental factors.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- faults on driven loads and couplings and their consequences, include slipping belts, poorly aligned coupling (shims), vibration, loads bearing failing, load stalling.
- locating faults in three phase induction motors and their controls

T7 Troubleshooting electrical installations encompassing:

- circuit diagrams, wiring diagrams, cable schedules and specifications of electrical installations
- causes of electrical installation faults from supplied symptoms and circuit diagrams include open and partially open circuit wiring, short and partially short circuit wiring, low insulation resistance, incorrect polarity, transposition of conductors, RCD tripping.
- locating faults in electrical installations
- repairing faulty electrical installation circuits components and wiring.

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.1)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines - UEE07'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
    - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
    - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
    - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit . It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
    - Demonstrate an appropriate level of skills enabling employment
    - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

- Find and repair faults in electrical apparatus and circuits as described as described in 8) and including:

  A Envisaging the likely extent of the fault and the work from fault/breakdown reports and/or discussion to elicit information on the fault/breakdown with appropriate person(s).

  B Using appropriate tools and resources, and methodical fault finding techniques.

  C Locating and trouble-shooting faults efficiently.

  D Conducting tests or measurements in strict accordance with OHS and electrical safe working requirements.

  E Rectifying faults effectively.

  F Reporting cause of the fault and justifying the repairs undertaken.

  G Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to trouble-shooting and repairing faults in electrical apparatus and circuits.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.**5**)

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEG109A	Develop and connect electrical control circuits t

Range Statement

RANGE STATEMENT

8) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in trouble-shooting and repairing faults in electrical apparatus and circuits designed for voltages up to 1000 V a.c. or 1500 V d.c in at least:

Four of the following **equipment and associated circuit**

- Switchboards
- Protective devices
- Lighting
- Heating
- Socket outlets
- Control devices

and

Three of the following **machines and associated control circuits**

- Single phase motors
- Single phase motor controls
- Three phase motors

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

- Three phase motor controls
- Synchronous machines
- DC machines
- DC machines controls
- Transformers and auxiliary components

Notes.

1. The different types of faults include; Open-circuit; Short-circuit; Incorrect connections; Insulation failure; Unsafe condition; Apparatus/component failure; Related mechanical failure; Other electrical apparatus and circuit faults

2. Examples of apparatus are Control devices; Fixed appliances/accessories; Lighting; Single phase motors and their controls; Socket outlets Three phase motors and their controls, synchronous machines and their controls, transformers and their controls, switchboards and/or distribution boards and their controls, protection and/or metering devices, a.c./d.c. machines and their controls other like equipment/accessories.

3. Examples of circuits include those supplying fixed appliances; lighting; single-phase motors; socket outlets; three phase motors and controls circuits; machines and transformers; electronic or computer based equipment other like equipment/accessories.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Application of the Unit **4**)

4.1) **General Application**

This unit applies to all qualifications, competencies and/or Skill Sets which require an electrical license.

4.2) **Importation**

RTOs wishing to import this unit into any qualification under the flexibility provisions of NQC Training Package Policy

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a unit of competency

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Develop and prepare to connect electrical control circuits.	1.1 OHS procedures for a given work area are identified, obtained and understood.
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed.
	1.3 Safety hazards, which have not previously been identified, are noted and established risk control measures are implemented.
	1.4 Control scenarios are determined from discussions with appropriate person(s) and documented in accordance with established procedures.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.5	Agreement for the control scenarios is sought from appropriate person(s) and documented in accordance with established procedures.
	1.6	Schematic arrangement of control circuits that complies with agreed scenarios is documented in accordance with established procedures.
	1.7	Materials needed to connect control circuits are obtained in accordance with established procedures and checked against job requirements.
	1.8	Tools, equipment and testing devices needed to connect control circuits are obtained in accordance with established procedures and checked for correct operation and safety.
	1.9	Preparatory work is checked to ensure no damage has occurred and complies with requirements.
2 Connect and test electrical control circuits.	2.1	OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Control circuit components are connected to comply with the agreed control scenario.
	2.5	Control circuit operation is tested for agreed functionality and in strict accordance with OHS requirements and established safety procedures.
	2.6	Non-compliant control functions are rectified to comply with the agreed control scenario.
	2.7	Unexpected situations are dealt with safely and with the approval of an authorised person.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	2.8	Control circuits are connected and tested efficiently without unnecessary waste of materials or damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practice.
3 Completion and document circuit development activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	'As-connected' control circuits are documented using standard drawing conventions and an appropriate person or persons notified in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

7) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and developing and connecting control circuits.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG109A Electrical control devices and circuits

Evidence shall show an understanding of electrical control devices and circuits to an extent indicated by the following aspects:

T1 Basic relay circuits encompassing:

- Identification of given circuit diagrams (schematic) symbols and explain the operation of the components represented
- labelling wires and terminal (numbering systems)
- control relay - operating principles, basic contact configurations and identification and common applications
- push button - switching configurations and common applications
- selecting pushbuttons/pilot lamps from manufacturer’s catalogues for specific

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

applications

- development of simple stop-start relay circuit that incorporates pilot lights and latching circuit.
- connection and testing of control circuits

T2 Relay circuits and drawing conventions encompassing:

- circuit diagram drawing conventions
- selecting relays from manufacturers' catalogue for specified applications
- circuit development of electrical control circuit in accordance with a written description (specification) and list the sequence of operation of the circuit
- connecting simple electrical control circuit from circuit diagrams
- applying safe working practices when testing an electrical control circuit

T3 Remote STOP-START control and electrical interlocking encompassing:

- operation of local and remote start-stop control of relays
- operation of an electrically interlocked relay circuit
- development of a relay circuit incorporating local and remote start and stop buttons and electrical interlocking.
- connecting electrical circuits with local and remote start-stop control and with electrical interlocking.
- applying circuit checking and testing techniques to an electrical control circuit.

T4 Time delay relays encompassing:

- timers - operating principles, basic contact configurations and identification and common applications
- selecting timers for specified functions from manufactures' catalogues
- development of timer controlled circuits from a written description and list the sequence of circuit operation
- connecting a timer controlled circuit using a circuit diagram as a guide.
- timer circuit checking and testing procedures.

T5 Circuits using contactors encompassing:

- contactors - operating principles, basic contact configurations and identification and common applications
- thermal overloads - operating principles, basic contact configurations and identification and common applications
- circuit diagram symbols
- circuit development using a contactor
- using contactors for motor control.
- compliance requirements for devices for isolating circuits.

T6 Jogging and interlocking encompassing:

- purpose and application of jogging control of motors
- operation of motor control using start, stop and jog buttons

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- purpose and application of electrical/mechanical interlocking
- developing a multiple motor starting circuit from a description of the circuit operation including jog and interlock functions.
- selecting circuit components using manufacturers' catalogues for appropriate duty ratings
- connecting and testing a multiple motor starting circuit which incorporates start, stop and jog control.

T7 Control devices encompassing:

- common control devices used in automatic control circuits: limit switches, proximity switches, photoelectric cells, pressure switches, float switches, light sensors and temperature sensors
- basic operating principles of common control devices
- advantages and disadvantages of common control devices
- applications for common control devices
- selecting control devices using manufacturers' catalogues for specified applications
- connection of control devices into control circuits

T8 Programmable relays encompassing:

- programmable relays - advantages over electromagnetic relay circuit control.
- typical applications of programmable relays.
- block diagram representation and basic operating principles
- input and output parameters, listing, connections and output types.
- connecting input and output devices to a programmable relay using a diagram
- basic programming of ladder circuits consisting of inputs, outputs i.e. stop-start circuit
- using the monitoring facility of the programmable relay to verify each ladder circuit operation.
- programming timers and using the monitoring facility of the programmable relay to check the values of the timer
- external devices
- implications of programming normally closed field devices
- conversion of control circuits
- installation of programmable control relays
- common faults and their symptoms

T9 Three-phase induction motor starters encompassing:

- reasons for limiting the starting current of large motors.
- requirements of the wiring rules (AS/NZS 3000) and the local supply authority service rules, with regard to starting and control of induction motors.
- DOL starter operating principles, applications and circuits
- electronic (soft) starter operating principles, applications and circuits
- connecting a DOL motor starter and testing the operation of the power and control circuits

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- installation of DOL and soft starters

T10 Three-phase induction motor starters- reduced voltage encompassing:

- star-delta starter operating principles and circuits
- primary resistance starter operating principles and circuits
- auto-transformer starter operating principles and circuits
- secondary resistance starter operating principles and circuits
- common applications for each starter type
- comparison of motor starters basic characteristics
- selecting the most suitable motor starter for a given situation
- connecting motor starter power and control circuits for correct operation
- measuring starting current and torque of selected motor starters
- installation of reduced voltage starters

T11 Three-phase induction motor reversal and braking encompassing:

- reversing operating principles and control circuits
- plug braking operating principles and circuits
- dynamic braking operating principles and circuits
- regenerative braking operating principles and circuits
- eddy current brakes operating principles and circuits
- mechanical brakes operating principles and circuits
- comparison of the difference braking methods used.
- typical applications for each braking method.
- connecting a circuit with a braking feature to operate a three-phase motor.
- installation of motor braking control circuits

T12 Three-phase induction motor speed control encompassing:

- pole changing operating principles and circuits
- variable frequency drives operating principles and circuits
- slip-ring motors operating principles and circuits
- installation of motor speed controllers.

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with

EVIDENCE GUIDE

and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:

- Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Develop and connect control circuits as described as described in 8) and including:
    - A Determining control scenarios specifications.
    - B Developing schematic arrangement of control circuits that meets the required scenario as specified.
    - C Connecting control circuit to function as specified.
    - D Conducting safety and functional testing correctly
    - E Identifying and correcting non-compliant control functions.
    - F Documenting 'as-connected' control circuit.
    - G Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

EVIDENCE GUIDE

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to development and connecting electrical control circuits.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEG108B	Trouble-shoot and repair faults in low voltage electrical apparatus and circuits

Range Statement

RANGE STATEMENT

8) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to developing, connecting and safety and functional testing on more than one occasion of at least four of the following control circuits:

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

- Multiple light switching circuit
- Master control circuit
- Single stop-start circuit
- Multiple stop-start circuit
- Time controlled circuit
- Machine interlocked circuit
- Motor jogging circuit
- Machine safety circuit

and,

using at least five of the following devices

- Multi-way switches
- Switches with more than two positions and Off
- Push buttons
- Electromechanical relays
- Programmable relays
- Contactors
- Reversing contactors
- Three phase starters
- Reduced voltage starters

and

with at least two of the following transducers/sensors:

- Timers
- Limit switches
- Proximity switches
- Photoelectric cells
- Pressure switches
- Float switches
- Light sensors
- Temperature sensors

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

UEENEEG110A Find and repair faults in LV d.c. electrical apparatus and circuits

Modification History

Not applicable.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers finding and repairing faults in electrical apparatus and interconnecting circuits and equipment operating at voltages up to 1,500 V d.c. It encompasses working safely, reading circuit diagrams, sketching diagrams from traced wiring, applying logical fault finding procedures, conducting repairs and completing the necessary service documentation.

Application of the Unit

Application of the Unit **2)**

This unit is intended for competency development entry-level employment based programs incorporated in approved contracts of training. It may also used to augment formally acquired competencies.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit require a license to practice in the workplace subject to regulations for undertaking of electrical work. Practice in workplace and during training is also subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle, assemble of utilities components
UEENEEE104A	Solve problems in d.c circuits
UEENEEE105A	Fix and secure electrotechnology equipment
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEG006A	Solve problems in single and three phase low voltage machines
UEENEEG033A	Solve problems in single and three phase electrical apparatus and circuits
UEENEEG063A	Arrange circuits, control and protection for general electrical installations
UEENEEG101A	Solve problems in electromagnetic devices and related circuits
UEENEEG102A	Solve problems in low voltage a.c. circuit
UEENEEG106A	Terminate cables, cords and accessories for low voltage circuits
UEENEEG108A	Trouble-shoot and repair faults in low voltage electrical apparatus and circuits

© Commonwealth of Australia, 2025 Powering Skills Organisation

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 'Literacy and Numeracy'

Reading 4 Writing 4 Numeracy 4

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to find and rectify faults.	1.1 OHS procedures for a given work area are identified, obtained and understood.
	1.2 OHS risk control measures and procedures in preparation for the work are followed.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.3	The likely extent of work to be undertaken is envisaged from fault/breakdown reports and/or discussions with appropriate person(s).
	1.4	Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
	1.5	Sources of materials that may be required for the work are established in accordance with established procedures.
	1.6	Tools, equipment and testing devices needed to locate faults are obtained in accordance with established procedures and checked for correct operation and safety.
2 Find and repair faults.	2.1	OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Safety hazards resulting from the fault or breakdown are documented and risk control measures devised and implemented in consultation with appropriate personnel.
	2.5	Fault finding is approached methodically drawing on knowledge of d.c. circuit and apparatus using measured and calculated values of circuit/apparatus parameters.
	2.6	Circuit/apparatus components are dismantled where necessary and parts stored to protect them against loss or damage.
	2.7	Faulty circuits/components are rechecked and their fault status and acquired.
	2.8	Materials/replacement parts required to rectify

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		faults are sourced and obtained in accordance with established procedures.
	2.9	Effectiveness of the repair is tested in accordance with established procedures.
	2.10	Apparatus is reassembled, finally tested and prepared for return to service.
	2.11	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.12	Fault finding and repair activities are carried out without damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practices.
3 Completion and report fault finding and repair activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Reusable, faulty or worn components are tagged and dispatched for repair to maintain adequate spares.
	3.3	Maintenance work activities are documented in accordance with established procedures. Note. Examples of documentation are component faults reports, test results, authorisations, permits, parts/component dispatch and stores records.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and finding and repairing faults in LV d.c. electrical apparatus and circuits.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

KS01-EG110A Direct current machines and controls

Evidence shall show an understanding of d.c. motor control methods to an extent indicated by the following aspects:

T1 Direct current machines encompassing:

- Purpose, types and applications
- Operating principles
- Installation and starting/running requirements and limitations
- Connection arrangements
- Typical fault symptoms and related conditions

T2 Direct current motor starters and their operating principles encompassing:

- back emf
- series-lockout
- timed starters
- electronic controllers

T3 Power and control connection arrangements encompassing:

- Built-in stop/start control
- Remote stop/start control
- Overload protection
- Interlocking with other starters and controls

T4 Braking methods encompassing:

- Dynamic,
- Plugging,
- Electromechanical, and
- Regenerative.

T5 Speed control methods encompassing:

- Field control
- Rheostatic control
- Voltage control

T6 Protection of d.c. motors

Evidence Guide

EVIDENCE GUIDE

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Critical aspects of evidence required to demonstrate competency in this unit **9.2)**

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Find and repair faults in d.c. electrical apparatus and circuits as described in 8) and including:

A Envisaging the likely extent of work from fault/breakdown reports and discussion with appropriate person(s).

B Using methodical fault finding techniques.

C Finding faults efficiently.

D Rectifying faults effectively.

E Completing documentation correctly.

© Commonwealth of Australia, 2025 Powering Skills Organisation

F Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to finding and repairing faults in d.c. electrical apparatus and circuits.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Concurrent assessment and relationship with other units **9.5)**

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEG10 Develop and connect electrical control circuits 9A

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to finding and repairing faults and their cause in d.c. electrical apparatus and circuits. Finding and repairing fault types in electrical apparatus and interconnecting circuits and equipment operating at voltages up to d.c include the following:

- Open-circuit
- Short-circuit
- Incorrect connections
- Insulation failure
- Unsafe condition
- Apparatus/component failure
- Related mechanical failure
- Other electrical apparatus and circuit faults
- Any five of the above shall apply.

Note:

1. Examples of apparatus are d.c switchboards/distribution boards, protective devices such as circuit breakers and fuses, and d.c machines and associated control devices.

2. Examples of circuits include those related to d.c. apparatus; d.c machines and controls circuits.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit deals with the repair and/or replacement of mechanical and electrical components of electrical apparatus. It encompasses safe working practices, following written and oral instruction and procedures, basic testing and techniques for dismantling and assembling apparatus and disconnecting and reconnecting components

Application of the Unit

Application of the Unit **2)**

This unit may apply to persons entering work in electrotechnology and may be used in school based vocational programs.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace provided equipment is not connected to installation wiring at voltage above 50 V a.c. or 120 V d.c. However, practice in this unit is subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting and risk safety measures.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, assemble and dismantle utilities industry components

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading 3 Writing 3 Numeracy 3

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to repair electrical apparatus.	1.1 OHS procedures for a given work area are obtained and understood through established routines and procedures.
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed.
	1.3 The nature of the repair is obtained from documentation or from work supervisor to establish the scope of work to be undertaken.
	1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
	1.5 Sources of materials that may be required for the work are established in accordance with established routines and procedures.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.6	Tools, apparatus and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2 Repair electrical apparatus.	2.1	Established OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits/apparatus are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Apparatus is dismantled in accordance with manufacturer's guide and supervisor's instructions.
	2.5	Component parts are tagged during the dismantling to help ensure correct and efficient reassembly and stored to protect them against loss or damage.
	2.6	Repairs are affected efficiently without damage to other components, apparatus or circuits.
	2.7	Apparatus is assembled in an appropriate sequence with all components parts placed, secured and connected in accordance with manufacturer's guide or industry practice.
	2.8	Procedures for referring non-routine events to immediate supervisor for directions are followed.
	2.9	Repairs are carried out efficiently without unnecessary waste of materials or damage to apparatus and the surrounding environment or services and using sustainable energy practices.
3 Complete and report repair work	3.1	OHS work completion risk control measures and procedures are followed.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA
activities.	
	3.2 Repaired apparatus is prepared and forwarded to appropriate person(s) for testing.
	3.3 Work area is cleaned and made safe in accordance with established procedures.
	3.4 Work supervisor is notified of the completion of the repair work in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and carrying out basic repairs to electrical apparatus.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG111A Electrical basic equipment repair

Evidence shall show an understanding of electrical workshop and metal cutting and an ability to carry out those activities to an extent indicated by the following aspects:

T1 Basic cable and conductor terminations encompassing:

- Insulation removal and replacement
- General aspects and soldering involving pins on electronic components and stranded conductors carrying current up to 25 amperes.
- Application of connecting devices for conductors and terminals
- Continuity through connections and insulation resistance testing
- Stress release on cables/conductors

T2 Electrical workshop machines encompassing:

- Fixed position power tools
- Tooling used on drilling machines
- Twist drills features, sharpening and faults
- Drilling operations

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Off hand grinding safety and machine set up

T3 Principles of metal cutting encompassing:

- Factors influencing the action of cutting tools
- Principles of chip formation
- Effects of cutting tool geometry
- Effects of coolants and cutting fluids

T4 Selection of cutting tools encompassing:

- Factors influencing tool selection
- Cutting tool materials
- Turning cutting tool design
- Milling cutting tool design
- Principles of chip control
- Identification and selection of carbides

T5 Metal cutting conditions encompassing:

- Conditions under which tools cut best
- Determining cutting data

T6 Cutting tool defects encompassing:

- Identification of types of tool failures
- Causes of tool failure

T7 Overcoming causes of tool failure

Overview of 9.1)

© Commonwealth of Australia, 2025 Powering Skills Organisation

Assessment

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria

© Commonwealth of Australia, 2025 Powering Skills Organisation

shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Carry out basic repairs to electrical apparatus as described as described in 8) and including:

A Following manufactures service instructions for access to components.

B Removing at least three different types of components specified in the work instructions.

C Replacing components to manufacturer's requirements.

D Terminating internal wiring correctly.

E Reassembling the apparatus correctly.

F Testing apparatus operation.

G Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be

© Commonwealth of Australia, 2025 Powering Skills Organisation

clearly identified.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

Resources required to assess this unit are listed above in Context of assessment', which should also be used in the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to carrying out basic repairs to electrical apparatus.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

2 Diagnose and rectify faults.	2.1	OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Safety hazards resulting from the fault or breakdown are documented and risk control measured and devised and implemented in consultation with appropriate personnel.
	2.5	Logical diagnostic methods are applied to diagnose lift system apparatus faults employing measurements and estimations of system operating parameters referenced to system operational requirements.
	2.6	Suspected fault scenarios are tested as being the cause(s) of system fault.
	2.7	Cause of the fault is identified and appropriately

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT		PERFORMANCE CRITERIA	
			competent persons are engaged to rectify the fault where it is outside the scope of the lift systems.
		2.8	Faults in the lift components of the system are rectified to raise apparatus and system to its operational standard.
		2.9	System is tested to verify that the system operates as intended and to specified requirements
		2.10	Methods for dealing with unexpected situations are selected on the basis of safety and specified work outcomes.
		2.11	Diagnosis and rectification activities are carried out efficiently without unnecessary waste of materials or damage to apparatus and the surrounding environment or services and using sustainable energy practices.
3	Completion and report fault diagnosis and rectification activities	3.1	OHS work completion risk control measures and procedures are followed.
		3.2	Reusable, faulty or worn components are tagged and dispatched for repair to maintain adequate spares.
		3.3	Rectification of faults is documented in accordance with established procedures. Note. Examples of documentation are components fault reports, test results, authorisations, permits, parts/component dispatch and store records
		3.4	Appropriate person or persons notified, in accordance with established procedures, that the system faults have been rectified.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and diagnosing and rectifying faults in lifts systems.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG116A Traction lift systems

Evidence shall show an understanding of the operation of the various types of lifts and the emergency procedures for the release of trapped passengers to an extent indicated by the following aspects:

T1 Technical standards, regulations and codes for lifts and escalators encompassing:

- Lift Code
- Australian Standards relevant to lift systems

T2 Lift systems – drive types, construction and operation of passenger, goods and service lifts encompassing:

- Drive types
- Drive constructions
- Drive operations
- Single and team manual handling
- Communication on site
- Emergency procedures
- Passenger
- Goods
- Service

T3 Lift machine room encompassing:

- access
- Machine
- Controller
- Governor
- Floor selector

T4 Lift well equipment encompassing:

- Guide rails
- Landing doors and locks
- Limit switches/operating devices
- Ropes

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Roping systems
- Counterweights

T5 Lift pit encompassing:

- access
- Buffers
- Compensators
- Safety equipment

T6 Lift car encompassing:

- access
- Frame
- Superstructure
- Door operator
- Travelling cable
- Buttons and indicators
- Communication devices
- Safety gear

T7 Lift control circuits using relay logic encompassing:

- Button circuit
- Indicator/lantern circuit
- Key switch circuits
- Fans
- Mains supply
- Power circuits
- Floor selector circuitry
- Motor room control (selector)
- Well control (transducer)
- Directional circuitry
- Slowing and stopping circuitry
- Re-levelling circuitry
- Door operator circuitry
- Acceleration circuits

T8 Lift safety circuits encompassing:

- Landing door locks
- Car door locks
- Emergency stop
- Pit switch
- Car trap-door limit switch
- Fire service

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Car top switch
- Tappet switch
- Governor/switch
- Safety gear switch
- Reverse phase relay
- Phase failure relay
- Overloads
- Circuit breakers
- Limit switches
- Terminal stopping
- Door protection
- Circuit switches

T9 Lift components - electro-mechanical employing relay logic encompassing:

- Button circuit
- Indicator/lantern circuit
- Key switch circuits
- Fans
- Mains supply
- Power circuits
- Floor selector circuitry
- Motor room control (selector)
- Well control (transducer)
- Directional circuitry
- Slowing and stopping circuitry
- Re-levelling circuitry
- Door operator circuitry
- Acceleration circuits

T10 Lift components - electro-mechanical safety circuits encompassing:

- Landing door locks
- Car door locks
- Emergency stop
- Pit switch
- Car trap-door limit switch
- Fire service
- Car top switch
- Tappet switch
- Safety gear switch
- Terminal stopping
- Circuit switches are all highlighted

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T11 Lift components - electronic encompassing:

- Encoders
- Transducers
- Electronic boards
- Selectors
- Rectifiers
- Capacitors
- Resistors
- Processor board
- I/O board

T12 Lift components – electrical encompassing:

- Relays; reverse phase and phase failure
- Tachos
- Limit switches
- Brushes
- Selectors
- Motor/generator
- Transformers
- Fuses
- Lamps
- Terminals

T13 Lift electrical layout and special requirements encompassing:

- Lift Code and AS 3000 requirements
- Special lift symbols
- Conduits
- Travelling cable
- Troughing
- Colour coding and labelling
- Segregation LV/ELV
- Communication cabling

T14 Traction encompassing:

- Speed/load characteristics
- Efficiency
- Application
- Brakes
- Electric prime mover (motor types and control)

T15 Geared types including rack and pinion and chain encompassing:

- Speed/load characteristics

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Efficiency
- Application
- Brakes
- Electric prime mover (motor types and control)
- Drum

T16 Electric lifts – mechanics encompassing:

- Governors Governor types including; vertical shaft, overspeed devices, horizontal shaft
- Governor operation testing and rope tension testing
- Safety gear Types; A instantaneous, B flexible guide clamp, C wedge clamp and D oil buffer
- Release procedures for each type of safety gear/governor combination
- Statutory requirements

T17 Maintenance, replacement and adjustment of mechanical lift components encompassing:

- Air cords
- Selectors
- Bearings; roller, sleeve, guide shoes, and slipper
- Door guides
- Landing doors
- Car doors
- Tapes/chains

T18 Brake types, function, operation, inspection and adjustment, circuitry, manual release and statutory requirements encompassing:

- Geared machine brakes
- Gearless machine brakes
- Brake function and statutory requirements
- Internal and external mechanical brakes
- Electrical operations including; stall motor, solenoid and hydraulic
- inspection and adjustment of mechanical and electrical brakes
- Brake circuitry
- Manual release devices and safe procedures
- Statutory requirements

T19 Electro-hydraulic lifts circuitry, controls and components encompassing:

- Electrical circuitry
- Pump motor, starter
- Governor switch
- Over travel limits
- Up, down solenoids

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Up, down limit switches
- Levelling switch
- Stop button
- Faulty components diagnosis
- Hydraulic components
- Hydraulic circuitry
- Servicing

T20 Electro-hydraulic lifts - mechanical operation – fluid power principles and components, operation, arrangements, lift code and other requirements and emergency passenger release encompassing:

- Fluids
- Hydraulics
- Pascal's Law
- Safety considerations of fluids under pressure
- Pump
- Control of hydraulic pressure
- Solenoid values
- Directional flow including pressure gauge
- Ram/cylinders, including single and multi stage
- Oil cooler
- Oil reservoir
- Filters
- Seals
- Bleeding lines
- General operation
- Types of arrangements including; side acting, direct and suspended
- Requirements of Lift Code/Standards including; viewing communication windows, labelling circuit breakers, head room/top of car, pump installation under car, anti-creep devices and closing of landing doors

T21 Emergency release procedures - trapped passengers – OHS considerations and communication with passengers encompassing:

- Enterprise requirements and procedures
- Passenger safety
- Moving under power
- Hand winding
- Determining numbers and condition of passengers
- Direction of lift travel before stopping
- Fault indication
- Status of doors
- Warnings about using controls

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Warnings about standing near doors
- Information related to impending movement
- Information relating to opening of doors
- Reassurance as to safety of passengers
- Emergency medical support

T22 Escalators and moving walks components encompassing:

- Machine Brakes
- Controller
- Safety devices
- Balustrade lighting
- Steps/pallets/belts
- Hand rail
- Drive chain
- Truss
- Track systems
- Step/pallet chains
- Rollers, Tension carriage
- Hand rail earthing

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment	**9.1)**
	Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment

© Commonwealth of Australia, 2025 Powering Skills Organisation

is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Diagnose and rectify faults in lift systems as described as described in 8) and including:

A Governors.

B Brakes.

C Safety gear.

D Safety devices.

E Lift machines.

F Door components.

  - Replace and/or adjustment of lift equipment in at least three types of lift equipment as described below

A Electro-hydraulic lift.

B Electric traction lift.

C Passenger lift.

D Goods lift.

E Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to diagnosing and rectifying faults in lifts systems.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

© Commonwealth of Australia, 2025 Powering Skills Organisation

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEG108A	Trouble-shoot and repair faults in low voltage electrical apparatus and circuits

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

Competency shall be demonstrated in relation to diagnosing and rectifying faults in lift circuits and associated components for at least three (3) types of lift circuits/components as listed:

- Governors
- Brakes
- Safety gear
- Safety devices
- Lift machines
- Door components
- Controllers
- Release passengers from a lift, which has become immobilised

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers the overhauling and repairing switchgear/controlgear rated in excess of 20 kA. It requires the ability to establish and document the level of work required, arranging for the overhaul/repair to be carried out, verify compliance of overhauled/repaired switchgear/controlgear and complete the necessary documentation.

Application of the Unit

Application of the Unit **2)**

This unit is intended to augment previously acquired competencies. It is suitable for employment-based programs under an approved contract of training.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit require a license to practice in the workplace where plant and switchgear/control gear operate at voltage above 50 V a.c. or 120 V d.c. Other conditions related to communications, electrical work, fire protection, gas work, high voltage work, refrigeration/air conditioning and security may apply in some jurisdictions subject to regulations. Practice in the workplace and during training is also subject to

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle, assemble of utilities components
UEENEEE104A	Solve problems in d.c circuits
UEENEEE105A	Fix and secure electrotechnology equipment
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEG111A	Carry out basic repairs to electrical components and equipment
UEENEEG164A	Repair and maintain mechanical components of electrical machines

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and

© Commonwealth of Australia, 2025 Powering Skills Organisation

Numeracy'

Reading 4 Writing 4 Numeracy 4

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare for overhaul/repair of switchgear/control gear.	1.1 OHS processes and procedures for a given work area are identified, obtained and understood.
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed.
	1.3 Safety hazards that have not previously been identified are noted and established risk control measures are implemented.
	1.4 Instructions on the extent of overhaul and/or repair are received and expected outcomes of the work acquired with appropriate personnel.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.5	Appropriate personnel are consulted to ensure the work is coordinated effectively with others involved on the work site.
	1.6	Switchgear/control gear service and repair documentation is read and understood.
	1.7	Sources of materials that may be required for the work are established in accordance with established procedures.
	1.8	Tools, equipment and testing devices needed to work are obtained in accordance with established procedures and checked for correct operation and safety.
2 Overhaul switchgear/control gear.	2.1	OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Switchgear and control gear is dismantled and parts tagged and stored to prevent loss or damage.
	2.5	The state of switchgear/control gear components is determined by measurements, tests and inspections and results recorded.
	2.6	Materials/replacement parts required to complete the work are sourced and obtained in accordance with established procedures.
	2.7	Effectiveness of the repairs is tested in accordance with established procedures.
	2.8	Specifications and instructions for the overhaul/repair work are documented in accordance with requirements.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
3 Document overhaul/repair work.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Reusable, faulty or worn components are tagged and dispatched for repair to maintain adequate spares.
	3.3	Overhaul/repair work is documented in accordance with requirements stating that the switchgear/control gear complies with the overhaul specifications.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and overhauling and repairing major switchgear/controlgear.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG129A Switchgear and controlgear – 20 kA

Evidence shall show an understanding of the switchgear and controlgear to an extent indicated by the following aspects:

T1 Types and applications of switchgear and controlgear

T2 Operating principles of switchgear and controlgear

T3 Interlocking systems encompassing:

- external interlocking systems such as Castell Key systems
- internal interlocking systems for either safety or that operate in conjunction with say Castell Key systems

T4 Control and protection of switchgear and controlgear

T5 Installation requirements encompassing:

- operating specifications for equipment
- areas requiring repairs and maintenance
- determining if repairs/maintenance are to be carried in situ or in workshop environment
- relevant legislation and Standards applicable to the installation

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- OHS issues with regard to removing/ re-installing heavy equipment
- electrical safety issues with regard to removing/ re-installing equipment
- understanding of CFC units

T6 Electrical switchgear and controlgear protection methods encompassing:

- understanding of the operation of switchgear when it opens under load
- understanding on the settings and operation required for both magnetic short-circuit and thermal overload with equipment
- determining the earth fault loop impedance requirements required to keep touch voltage values within requirements
- thermal imaging techniques
- time/current curves from manufacturers specifications
- equipment to safely test switchgear after repairs or maintenance
- effectiveness of arc suppression installed within the equipment
- modern types of switchgear that are computer controlled and programmed
- modern types of switchgear that are interconnected to other protective devices
- certification process for any repair or maintenance work performed
- phase-failure systems
- Verifying the correct fault-level for the installation is consistent with the kA rating of the equipment
- x-ray and ultrasonic detection systems with regard to metallurgy
- different types of lubricants required for different locations, temperatures and humidity

T7 Electrical safe working practices of working safely on or around electrical equipment encompassing:

- determining safe working Standards and codes of practice for equipment and installations over 20 kA
- OHS requirements for equipment and installations over 20 kA
- working knowledge of operating within the vicinity of live conductors, such as barriers
- procedures for working on switchgear over 20 kA
- risks and control measures associated with harmful dusts and airborne contaminants - sources include thermal insulation, fibrous cement materials and asbestos and other fibre reinforced switchboard materials
- checks and storage methods for maintaining the safety of testing devices

Evidence Guide

EVIDENCE GUIDE

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Overhaul and repair major switchgear/controlgear as described in 8) and including:

A Interpreting service and repair documentation correctly.

B Determining the state of switchgear/control gear correctly.

C Repairing switchgear/control gear effectively.

© Commonwealth of Australia, 2025 Powering Skills Organisation

D	Completing documentation correctly.
E	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to overhauling and repairing major switchgear/controlgear.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEC001B	Maintain documentation
UEENEEC002B	Source and purchase material/parts for installation or service jobs

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to overhauling at least two types of low voltage switchgear/control gear rated above 20 kA and any high voltage switchgear/control gear.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA	
1 Prepare to wind coils.	1.1	OHS procedures for a given work area are identified, obtained and understood.
	1.2	Established OHS risk control measures for work preparation are followed.
	1.3	Work instructions are identified, obtained and understood.
	1.4	Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
	1.5	Materials required for the work are obtained in accordance with established routines and procedures.
	1.6	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2 Wind coils.	2.1	Established OHS risk control work measures are followed.
	2.2	Winding machines are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.3	Winding wire and insulation is selected in accordance with work instructions and established routines.
	2.4	Winding formers and machine is set-up in accordance with routine instructions.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	2.5	Prescribed solutions are used to resolve work completion issues.
	2.6	Routine quality checks are conducted to ensure coils are correctly wound with correct wire, number of turns and shape.
	2.7	Work is completed in acceptable timeframe given environment and workplace conditions.
3 Complete work report.	3.1	OHS measures work completion risk control are followed.
	3.2	Work report forms/data sheets are completed accurately.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and winding coils.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies

KS01-EG150A Coil winding and coil testing

Evidence shall show an understanding of coil winding and coil testing to an extent indicated by the following aspects:

T1 Coil data to be collected:

- Type of wire.
- Gauge.
- Number of turns.
- Type of coil.
- Type of insulation.
- Coil shape.

T2 Coil former types and construction/set up

- Coil shapes
- Factors which govern coil shape:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- end room;
- coil flexibility;
- bore size of stator iron core;
- depth of iron below the slots, in the iron core;
- pressure points between the coils
- Types coil winding formers

T3 Coil winding machines

- Identify machine types:
- foot pedal,
- variable speed,
- winding head fitted with a chuck;
- Remote foot switch on a flexible lead, variable speed fitted with a face plate;
- layer winding machine;
- computer operated
- Operational safety precautions

T4 Coil insulations.

- Purpose
- Temperature ratings
- Common insulating materials
- Polyester film backed elephantide; Nomex;
- Mylar;
- Nomex/mylar/nomex; Dacron/mylar/dacron;
- cloth, tape, and adhesive tape (glass); polyester glass laminate;
- sheet, tape, and adhesive tape (polyester film);
- Bakelite paper laminates

T5 Rewind small and medium size solenoid coils

- Strip and record data
- Prepare/insulate coil formers
- Wind each type of coil
- Finishing off process
- Test procedures

T6 Types of testing devices

- Multimeter;
- Series light;
- Insulation resistance tester;
- Wheatstone bridge

T7 Purpose of testing devices

- Multimeter;

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Series lamp;
- Insulation resistance tester;
- Wheatstone bridge

T8 Types of tests

- Continuity
- Short circuited turns
- Insulation resistance

T9 Testing techniques to identify faulty coils

- Physical inspection.
- Using a testing device.

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the

© Commonwealth of Australia, 2025 Powering Skills Organisation

most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be

© Commonwealth of Australia, 2025 Powering Skills Organisation

required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.

- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Winding coils as described as described in 8) and including:

A Following winding specifications.

B Selecting correct winding wire and insulation.

C Setting up and operating winding machine.

D Adhering to quality procedures.

E Completing work report/forms accurately.

F Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

© Commonwealth of Australia, 2025 Powering Skills Organisation

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to winding coils.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units **9.5)**

There are no concurrent assessment recommendations for this unit.

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to winding at least four different types of coils in an environment designed specifically for the purpose.

Generic terms used throughout this Vocational Standard shall be regarded as part of

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers insulating, placing and connecting electrical coils, in an small armatures/stators, transformers and solenoid equipped devices. The unit encompasses working safely, using hand and powered tools, measuring, applying basic knowledge of electrical circuits, connecting conductors following technical instructions and set procedures and recording work activities.

Application of the Unit

Application of the Unit **2)**

This unit is intended for competency development entry-level employment based programs incorporated in approved contracts of training.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace. However, practice in this unit is subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, assemble and dismantle utilities industry components
UEENEEE104A	Solve problems in d.c. circuits
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEG150A	Wind electrical coils

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the

Employability Skills	**5)** qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Prepare to place and connect coils.	1.1	OHS procedures for a given work area are identified, obtained and understood.
		1.2	Established OHS risk control measures for work preparation are followed.
		1.3	Work instructions are identified, obtained and understood.
		1.4	Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
		1.5	Materials required for the work are obtained in accordance with established routines and procedures.
		1.6	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2	Place and connect coils.	2.1	Established OHS risk control work measures are followed.
		2.2	Machines/equipment is checked as being isolated where necessary in strict accordance OHS requirements and procedures.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	2.3	Coils and insulation are selected in accordance with work instructions and established routines.
	2.4	Insulation is cut and applied in accordance with work instructions and established routines.
	2.5	Coils are place in accordance with work instructions and established routines.
	2.6	Coils ends are prepared and connections made in accordance with work instructions and established routines.
	2.7	Prescribed solutions are used to resolve work completion issues.
	2.8	Routine quality checks are conducted to ensure coils are correctly wound with correct wire, number of turns and shape.
	2.9	Work is completed in acceptable timeframe given environment and workplace conditions.
3 Complete work report.	3.1	OHS measures work completion risk control are followed.
	3.2	Work report forms/data sheets are completed accurately.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and placing and connecting coils.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG151A Electrical winding and connections

Evidence shall show an understanding of electrical winding and connections to an extent indicated by the following aspects:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T1 Winding wires.

- Types of winding wires.
- Winding wire varnishes.
- Varnish temperature ratings.
- Varnish removal methods.
- Types of varnish.
  - Air drying
  - Baking
  - Epoxy
- Dangers relating to handling
- Methods of application.
  - Brush.
  - Spray.
  - Dip.
  - Trickle.
- Measuring wires.
  - Gauge.
  - Micrometer.`

T2 Applications of winding wires

- Solenoid
- Stator windings
- Armature windings.
- Transformer windings
- Induction coils.

T3 Methods of winding wire connection

- Conductor preparation.
- Joining methods – soft soldering
  - Types of soldering irons and tips
  - Types of solder
  - Fluxes: purpose; types; dangers
  - Soldering process
  - Inspection
- Hard soldering - Silver soldering
  - Advantages
  - Types of silver soldering wire
  - Types of flux
  - Operation and safe working procedures with the oxy acetylene welding torch
  - Preparation of join

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Silver soldering process and inspection
- Fusing
  - Advantages
  - Preparation of join
  - Fusing process
  - Safe working procedures

T4 Insulation methods.

T5 Basic techniques in insulating coils for electrical static and rotating machines.

- Methods of insulating coils.
- Types of insulation used.
- Precautions.

T6 Coil types.

- Universal motor field coils (single phase);
- Distributed concentric coil group (single phase/three phase);
- Distributed “D” or mush shape coil group (three phase);
- Distributed round end (three phase);
- Distributed diamond shape coil group wound as individual coils (three phase)

T7 Basic techniques in placing coils for electrical static and rotating machines

- Record data
- Manufacture for universal field coils
- Coil finishing:
- insertion into slots;
- taping (where applicable);
- connection for correct polarity
- Electrical testing

ELEMENT	PERFORMANCE CRITERIA	
		wire, number of turns and shape.
	2.9	Work is completed in acceptable timeframe given environment and workplace conditions.
3 Complete work report.	3.1	OHS measures work completion risk control is followed.
	3.2	Work report forms/data sheets are completed accurately in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and rewinding three phase induction machines rated for low voltage.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG153A Low voltage three phase motor winding techniques

Evidence shall show an understanding of single phase machine winding to an extent indicated by the following aspects:

T1 Alternator windings encompassing:

- Elementary single-phase stator winding
- Elementary three-phase stator winding
- Half-coil and whole-coil windings
- Concentrated and distributed windings
- Chain, lap and wave windings
- Pole-pitch and coil-span
- Half-coil winding for a three-phase alternator
- Whole-coil stator winding for a three-phase alternator

T2 Rating, cooling and regulation encompassing:

- Rating of alternators
- Cooling of alternators
- The voltage regulator

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T3 Testing techniques encompassing:

- Continuity
- Insulation testing
- Use of ‘growler’
- Magnetic field testing

T4 Techniques of winding three phase motors.

- Electrical machine insulation types and applications
- Coil placement techniques
- Coil connection arrangements and terminations
- Winding insulation methods

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers electrical safety and functional testing of electrical machines designed to operate at low voltage. The unit encompasses working safely, setting up and conducting continuity, insulation and short circuit and inspection and testing of iron circuit, interpreting and documenting test results and any resulting corrective actions.

Application of the Unit

Application of the Unit **2)**

This unit is intended for competency development entry-level employment based programs incorporated in approved contracts of training.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit may require a license to practice in the workplace subject to regulations for undertaking of electrical work. Practice in workplace and during training is also subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, assemble and dismantle utilities industry components
UEENEEE104A	Solve problems in d.c. circuits
UEENEEE105A	Fix and secure electrotechnology equipment
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEG006A	Solve problems in single and three phase low voltage machines
UEENEEG101A	Solve problems in electromagnetic devices and related circuits
UEENEEG102A	Solve problems in low voltage a.c. circuits
UEENEEG106A	Terminate cables, cords and accessories for low voltage circuits

AND

UEENEEG150A	Wind electrical coils
UEENEEG151A	Place and connect electrical coils
UEENEEG1	Rewind three phase low voltage induction

© Commonwealth of Australia, 2025 Powering Skills Organisation

Prerequisite Unit(s) **4)**

53A	machines
OR	
UEENEEG033A	Solve problems in single and three phase electrical apparatus and circuits
UEENEEG063A	Arrange circuits, control and protection for general electrical installations
UEENEEG108A	Trouble-shoot and repair faults in low voltage electrical apparatus and circuits

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading	4	Writing	4	Numeracy	4

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

competency standard unit | Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to conduct electrical tests on three phase induction machines.	1.1 OHS procedures for a given work area are identified, obtained and understood.
	1.2 Established OHS risk control measures for work preparation are followed.
	1.3 The extent of the work is determined from job sheets, specifications and regulatory requirements.
	1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
	1.5 Winding data is obtained from winding data records or directly from measurements of stator and recorded in accordance with established procedures.
	1.6 Winding is stripped from stator in accordance with established procedures.
	1.7 Materials required for the work are obtained in accordance with established procedures.
	1.8 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2 Conduct electrical tests on three phase induction machines.	2.1 Established OHS risk control work measures are followed.
	2.2 Machines/equipment are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.3 All necessary electrical tests are conducted to established cause of faults or operational condition of the machine.
	2.4 Status of the machine is determined from test

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		results and recorded.
	2.5	Prescribed solutions are used to resolve work completion issues.
	2.6	Routine quality checks are conducted to ensure coils are correctly wound with correct wire, number of turns and shape.
	2.7	Work is completed in acceptable timeframe given environment and workplace conditions.
3 Complete work report.	3.1	OHS measures work completion risk controls are followed.
	3.2	The status of the machine is documented in accordance with established procedures and appropriate person(s) notified.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and conducting electrical tests on low voltage electrical machines.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG157A Low voltage motor testing devices and techniques

Evidence shall show an understanding of electric motor mechanical measuring and testing devices and techniques to an extent indicated by the following aspects:

T1 Test/measuring devices and their application

- Test/measuring devices
  - multimeter.
  - growler.
  - Insulation resistance tester
  - Hi-pot testing
- Application.
  - continuity.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- insulation.
- short circuit
- testing of magnetic circuit.

T2 Connection of test/measuring devices into a circuit encompassing:

- safety procedures.
- circuit arrangement of test/measuring devices.

T3 Taking and interpreting readings

With regards to:

- continuity.
- insulation.
- short circuit
- testing of magnetic circuit.

T4 Storage, maintenance and care of test/measuring devices

- Storage.
- Maintenance
- Care.

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment	**9.1)**
	Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the

© Commonwealth of Australia, 2025 Powering Skills Organisation

normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

procedures and practices including the use of risk control measures as specified in the performance criteria and range statement

- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Conduct electrical tests on low voltage electrical machines as described as described in 8) and including:

A Dismantling machine and storing parts securely.

B Setting up tests correctly.

C Taking test reading accurately.

D Determining the status of the machine correctly from test result.

E Documenting the status of the machine clearly.

F Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a

© Commonwealth of Australia, 2025 Powering Skills Organisation

workplace. This should include:

OHS policy and work procedures and instructions.

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to conducting electrical tests on low voltage electrical machines.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units **9.5)**

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEG108A	Trouble-shoot and repair faults in low voltage electrical apparatus and circuits

OR

UEENEEG15	Rewind three phase low voltage induction

© Commonwealth of Australia, 2025 Powering Skills Organisation

3A machines

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to conducting electrical tests on at least two different low voltage electrical machines with one of the machines having at least two winding faults. The purpose of the tests is to establishing:

- The causes of faults in machines, and
- Whether a machine has been correctly repaired and complies with all requirements

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA	
1 Prepare to repair component.	1.1	OHS procedures for a given work area are obtained and understood through established routines and procedures.
	1.2	Established OHS risk control measures and procedures in preparation for the work are followed.
	1.3	Safety hazards which have not previously been identified are reported and advise on risk control measures are sought from the work supervisor.
	1.4	The nature of repair work is obtained from documentation or from work supervisor to establish the scope of work to be undertaken.
	1.5	Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
	1.6	Sources of materials that may be required for the work are established in accordance with established routines and procedures.
	1.7	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.8	Appropriate machine is selected, checked for safety and prepared for any necessary machining operation.
	1.9	Cutting tools are selected, sharpened and set up for correctly for each particular machining operation.
2 Repair components.	2.1	Established OHS risk control measures and procedures for carrying out the work are followed.
	2.2	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.3	Component being machined is positioned and clamped appropriately.
	2.4	Machining is carried out safely and to suit the component and material being machined.
	2.5	Appropriate measurements are taken to ensure repairs comply with technical standards and job specifications and requirements.
	2.6	Components are repaired to comply with technical standards and job specifications and requirements.
	2.7	Established methods for dealing with unexpected situations are discussed with appropriate person or persons and documented.
	2.8	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.9	Ongoing checks of the quality of repair work are undertaken in accordance with established procedures.
	2.10	Repairs are carried out efficiently without unnecessary waste of materials and energy and damage to apparatus, circuits, the surrounding environment or services.
3 Complete work and	3.1	OHS work completion risk control measures and

Overview of Assessment **9.1)**

© Commonwealth of Australia, 2025 Powering Skills Organisation

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with

© Commonwealth of Australia, 2025 Powering Skills Organisation

the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Repair mechanical components of electrical machines as described as described in 8) and including:

A Establishing the nature of the repair work.

B Selecting appropriate method of repair.

C Sharpening cutting tools/twist drills correctly.

D Securing work piece correctly.

E Repairing component to required standard.

F Documenting repairs in accordance with established procedures.

G Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified

© Commonwealth of Australia, 2025 Powering Skills Organisation

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to repairing mechanical components of electrical machines.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

© Commonwealth of Australia, 2025 Powering Skills Organisation

There are no concurrent assessment recommendations for this unit.

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to repairs and maintenance of at least two of the following electrical machine components:

- Shaft
- Bearing housing
- End shield
- Fan
- Coupling
- Machine housing

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Not applicable.

Competency Field

Competency Field **11)**

Electrical

© Commonwealth of Australia, 2025 Powering Skills Organisation

UEENEEG165A Maintain and service traction lifts systems and equipment

Modification History

Not applicable.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers maintenance and servicing of traction lift systems and equipment. It encompasses working safely, conducting site cleaning, lubricating and painting lift equipment, inspecting of suspension, governors, compensators, floor selector and tappet switch ropes, and carrying out periodic testing on lift safety gear.

Application of the Unit

Application of the Unit **2)**

This unit applies to any formal recognition for this standard at the aligned AQF 3 level or higher.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit require a license to practice in the workplace where plant and equipment operate at voltage above 50 V a.c. or 120 V d.c. However other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle, assemble of utilities components
UEENEEE104A	Solve problems in d.c circuits
UEENEEE105A	Fix and secure electrotechnology equipment
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEG006A	Solve problems in single and three phase low voltage machines
UEENEEG033A	Solve problems in single and three phase electrical apparatus and circuits
UEENEEG063A	Arrange circuits, control and protection for general electrical installations
UEENEEG101A	Solve problems in electromagnetic devices and related circuits
UEENEEG102A	Solve problems in low voltage a.c. circuit
UEENEEG106A	Terminate cables, cords and accessories for low voltage circuits
UEENEEG108A	Trouble-shoot and repair faults in low voltage electrical apparatus and circuits

© Commonwealth of Australia, 2025 Powering Skills Organisation

Prerequisite Unit(s) **4)**

UEENEEG116A	Diagnose and rectify faults in traction lift systems

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 'Literacy and Numeracy'

Reading 4 Writing 4 Numeracy 4

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to maintain and service lift equipment.	1.1 OHS procedures for a given work area are identified, obtained and understood.
	1.2 OHS risk control measures and procedures in preparation for the work are followed.
	1.3 The likely extend of work to be undertaken is envisaged from maintain procedures or fault/breakdown reports and/or discussions with appropriate person(s).
	1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with others.
	1.5 Tools, equipment and testing devices needed to carry out the work are obtained in accordance with established procedures and checked for correct operation and safety.
2 Maintain and service lift equipment.	2.1 OHS risk control measures and procedures for carrying out the work are followed.
	2.2 The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3 Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4 Safety hazards resulting from the fault or breakdown are documented and risk control measured and devised and implemented in consultation with appropriate personnel.
3 Completion and report of maintain and servicing activities	3.1 OHS work completion risk control measures and procedures are followed.
	3.2 Reusable, faulty or worn components are tagged and dispatched for repair to maintain adequate spares.
	3.3 Maintenance work activities are documented in accordance with established procedures.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA
	Note. Examples of documentation are components fault reports, test results, authorisations, permits, parts/component dispatch and store records

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and maintaining and servicing traction lifts.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EG165A Lift systems - lift component

Evidence shall show an understanding of the maintenance and servicing of traction lifts to an extent indicated by the following aspects:

T1 Lubricant selection for lift components encompassing:

- Corrosion protection
- Friction reduction
- Cooling
- Viscosity
- Lubricant loss and loss estimation
- Suitable oils, greases, coolants, rust preventatives and solvents for particular devices

T2 Lubricant application for lift components encompassing:

- Hand, Grease guns,
- Oil cans,
- Pressure lubricators,
- Oil misters,
- Level indicators,
- Estimating quantities,
- Lubrication points
- Automatic lubricators

T3 Lift systems single and multiple wrap roping, types of ropes and their attachments encompassing:

- Hoisting

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Governor
- Tappet
- Compensator
- Selector
- Normal lay rope
- Langs lay rope
- Standard ends attachments
- Splices
- Wedge sockets
- Talurit fitting
- Babbit sockets
- Secon fitting

T4 Lift systems basic rope inspection encompassing: Lift systems basic rope inspection encompassing:

- Requirements of Lift Code/enterprise
- Purpose
- Wear
- Broken strands
- Diameter
- Deformation
- Corrosion
- Lubrication
- Tension

T5 Rope stretch encompassing:

- Requirements of Lift Code/enterprise
- Counterweight clearance
- Compensatory equipment

T6 Inspection of rope attachments encompassing:

- Requirements of Lift Code/enterprise
- Rope anchor rods
- Castings, Springs
- Wedges
- Swaging
- Checking for fracturing
- Deformation
- Remedial action

T7 Inspection of sheaves encompassing:

- Groove condition

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Rifling
- Ropes down in sheaves
- Maintenance records

T8 Maintenance, replacement and adjustment of mechanical lift components encompassing:

- Door locks
- Air cords
- Selectors
- Bearings; roller, sleeve, guide shoes, and slipper
- Door guides
- Landing doors
- Car doors
- Tapes/chains
- Motor room equipment
- Well equipment
- Pit equipment

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the

© Commonwealth of Australia, 2025 Powering Skills Organisation

competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
    - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control

© Commonwealth of Australia, 2025 Powering Skills Organisation

measures as specified in the performance criteria and range statement

- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Maintain and service traction lifts as described as described in 8) and including:

A Conduct site cleaning, lubricating and painting of lift equipment.

B Inspect lift ropes.

C Maintain electro-hydraulic lift equipment.

D Carry out lift safety gear periodic testing.

E Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to maintaining and servicing traction lifts.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

There are no concurrent assessment recommendations for this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

- Competency shall be demonstrated in relation to maintaining and servicing at least two of the lift equipment as following:
  - Geared traction drive
  - Gearless traction drive
  - Drum drive
  - Suspended electro-hydraulic drive
- At least two of the roping systems as following:
  - Single or double wrap
  - Single or multiple fall
  - Side slung or underslung
  - Overhead or basement drive
  - Drum drive.
- And at least two of the components as following:
  - Suspension ropes
  - Governor ropes
  - Tappet ropes
  - Compensator ropes
  - Floor selector tapes/ropes
- All safety gear periodic tests as following:
  - Governor type A
  - Governor type B
  - Governor type C

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Not applicable.

Competency Field

Competency Field **11)**

Electrical

UEENEEG199A Conduct compliance and functional verification of electrical apparatus and existing circuits

Modification History

Not applicable.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers inspection and testing to verify whether an electrical apparatus and/or existing circuits are safe and complies with all requirements. It encompasses working safely, visual inspections and mandatory, optional and functional testing following verification procedures, identifying non-compliance defects and mandatory reporting requirements.

Application of the Unit

Application of the Unit **2)**

2.1) General Application

This unit applies to all qualifications, competencies and/or Skill Sets which require an unrestricted electrical fitter licence.

Licensing/Regulatory Information

License to practice **3)**

During Training: Competency development activities are subject to regulations directly related to licencing, occupational health and safety and where applicable contracts of training such as apprenticeships.

In the workplace: The application of the skills and knowledge described in this unit require a license to

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

practice in the workplace where work is carried out on electrical equipment or existing circuits which are designed to operate at voltages greater than 50 V a.c. or 120 V d.c.

Other conditions may apply under State and Territory legislative and regulatory requirements.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle and assemble and utilities components
UEENEEE104A	Solve problems in d.c circuits
UEENEEE105A	Fix and secure electrotechnology equipment
UEENEEE107B	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEE137A	Document and apply measures to control OHS risks associated with electrotechnology work
UEENEEG006A	Solve problems in single and three phase low voltage machines
UEENEEG033A	Solve problems in single and three phase electrical apparatus and circuits
UEENEEG0	Arrange circuits, control and protection for

© Commonwealth of Australia, 2025 Powering Skills Organisation

Prerequisite Unit(s) **4)**

63A	general electrical installations
UEENEEG101A	Solve problems in electromagnetic devices and related circuits
UEENEEG102A	Solve problems in low voltage a.c. circuits
UEENEEG106A	Terminate cables, cords and accessories for low voltage circuits
UEENEEG108A	Trouble-shoot and repair faults in electrical apparatus and circuits
UEENEEG109A	Develop and connect electrical control circuits

Current Licence Holders:

Those holding an ‘Electrical Fitter Licence’ or equivalent issued in an Australian State or Territory meet the requirements of this unit and its pre-requisite requirements.

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading 5 Writing 5 Numeracy 5

Employability Skills Information

Employability Skills **5)**

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to inspect and test electrical apparatus and existing circuits.	1.1 OHS measures for the site are identified, obtained and understood.
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed
	1.3 Safety hazards, which have not previously been identified, are noted and established risk control measures are implemented.
	1.4 Documentation or deemed to comply standard on which electrical apparatus and existing circuits is based is reviewed and understood.
	1.5 Appropriate personnel are consulted to ensure the work is coordinated effectively with others involved on the work site.
	1.6 Tools, equipment and testing devices needed to verify compliance are obtained in accordance with established procedures and checked for correct operation and safety.
	1.7 Preparatory work is checked to ensure no damage has occurred and complies with

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		requirements.
2 Visually inspect and conduct safety testing on electrical apparatus and existing circuits.	2.1	OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and following switch-off, lock out and tagging procedures.
	2.4	Knowledge of electrical principles and their application to electrical apparatus and existing circuits is drawn upon in determining whether an electrical apparatus/existing circuits is compliant and functions safely and as intended.
	2.5	Wiring is checked for suitability for the environments in which they are installed and suitably protected from damage or overheating.
	2.6	Protection methods and devices are validated as meeting co-ordination requirements for overload and short-circuit protection.
	2.7	Switchgear and control gear is validated as being appropriately rated and meeting functional requirements.
	2.8	Evidence that electrical equipment complies with safety requirements is cited.
	2.9	Earthing system components are checked that they are correctly located and conductors correctly sized.
	2.12	Mandatory tests are conducted on all connected electrical apparatus and existing circuits to verify that: earthing conductor resistance is sufficiently low; insulation resistance is sufficiently high; all polarities are correct; and circuit connections are

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		correct.
	2.12	Testing is conducted to verify that: fault-loop impedance is sufficiently low and residual current devices operates as intended.
3 Report inspection and test findings.	3.1	OHS risk control work completion measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Non-compliance defects are identified and reported in accordance with established procedures.
	3.4	Recommendations for rectifying defects are made in accordance with established procedures.
	3.5	Mandatory documentation is completed in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and verifying compliance and functionality of electrical apparatus and existing circuits.

The knowledge and skills shall be contextualised to current industry standards, technologies and practices.

KS01-EG199A Electrical apparatus and existing circuits — verification and testing

Evidence shall show an understanding of electrical apparatus and existing circuits testing and verification to an extent indicated by the following aspects:

T1 (Is the number correct?)Electrical safety encompassing:

- Safety procedures for working on electrical systems, circuits and apparatus.
- Safe working practices as a normal part of carrying out electrical installation work
- Isolation and lockout procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Tools and equipment needed to conduct electrical work compliance inspection and testing.

T2 Legislated regulations encompassing:

- legislation and regulations that require electrical apparatus and existing circuits to be inspected and tested to ensure they are safe.
- the person/bodies responsible for the various aspects of ensuring electrical apparatus and existing circuits are safe.
- results of tests that show an electrical apparatus and existing circuits is safe for connection to the supply.
- results of periodic inspection and tests that show electrical equipment are safe to use.

T3 Visual inspection of electrical apparatus and existing circuits for compliance with the Wiring Rules encompassing:

- Protection requirements
- General condition
- Wiring systems
- Equipment and accessories
- Earthing

T4 Testing electrical apparatus and existing circuits encompassing:

- tests to ensure: insulation resistance is adequate; earth continuity is such that it will ensure the operation of protection devices under earth fault conditions; polarity of active/s and neutral for final subcircuits is correct; there is no transposition of earthing and neutral conductors; fault-loop impedance is sufficiently low; RCD for correct operation and sensitivity.
- functional tests to ensure active/s and neutral for the same circuit are clearly identified with their circuit protection device.
- tests that show all circuits and devices operate as intended.
- tests to determine the fault level at a particular point in an installation.

T5 Documentation encompassing:

- results of tests conducted on an electrical apparatus and existing circuits comply with requirements and ensure the installation is safe.
- documents of the results of testing electrical apparatus and existing circuits as required by the local supply authority.
- documents of periodic testing and inspection of electrical equipment including tagging requirements.

KS02–EG199A Electrical apparatus and existing circuits — principles and requirements

Evidence shall show an understanding of electrical apparatus and existing circuits principles and requirements to an extent indicated by the following aspects:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T1 (Is the number correct?)Effects of electric current encompassing:

- Physiological effects of current.
- Basic principles by which an electric current can produce heat, light, motion and a chemical reaction.

T2 Single path practical circuit encompassing:

- Arrangement of energy source, protection device, switch and load in a circuit.
- The purpose of each component in the circuit.
- Consequences of an open-circuits, closed-circuits and short-circuits.

T3 Single-source multiple-path d.c. circuits encompassing:

- Circuit configurations and connection.
- Relationship between parameter of voltage, current, resistance power dissipation in the whole or any part of the circuit.
- Safely measuring the parameters for the whole or any part of the circuit.
- Methods of determining circuit behaviour for variation in any of the parameters from measured and calculated values.

T4 Alternating voltage and current generation, phase relationships, energy in an a.c. circuit encompassing:

- Sinusoidal voltage generation and resulting current.
- The terms period; maximum value; peak-to-peak value; instantaneous value; average value; root-mean-square (r.m.s.) value; and frequency.
- Three-phases generation.
- Relationship between the phase voltages generated in a three-phase alternator and the conventions for identifying each.
- Method of determining the phase sequence or phase rotation of a three-phase supply.
- Methods of determining power and energy supplied by three phase circuits.

T5 Fundamental safety principles of the AS/NZS 3000 Part 1 (Section 1) and deemed to comply solution given in Part 2 encompassing:

- Definition of terms
- Fundamental safety principles of protection against direct and indirect contact with live parts; thermal effects; overcurrent; earth faults; abnormal voltages; spread of fire; mechanical injury and external influences.
- Fundamental principles of installation design; selection and installation of equipment; means of compliance (including alterations, additions and repairs) and verification of compliance.

T6 Electric motor selection, starting method and overload protection encompassing:

- Types of motor enclosures suitable for given environmental conditions
- Criteria for selecting motor starters and overload protection.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Types and connection arrangements for direct-on-line and reduced voltage starters.
- Thermal, magnetic and thermistor overload protection methods.

T7 Ability to apply AS/NZ 3000 requirements for protective and functional earthing encompassing:

- Purpose of protective and functional earthing.
- Parts of the protective earthing systems.
- Earthing arrangements, earthing of equipment and equipotential bonding.
- Methods of determining the maximum fault loop impedance for a circuit.
- Selection of protective conductor and active conductor sizes for each circuit to ensure earth-fault loop impedance is sufficiently low to operate the circuit protective device.

T8 MEN system and its application encompassing:

- The roles of the protective earthing (PE) and neutral (N) conductors in an a consumer's installation and their relationship to the protective earth neutral (PEN) conductor in the electricity distributor's system or sub-main to an outbuilding.
- The importance of the MEN link when a fault occurs.
- The likely consequences of the absence of the MEN link or high impendence in the PEN conductor when a fault occurs.
- The requirements for installation of an MEN link in an installation and an outbuilding.

T9 Knowledge of the application of transformers encompassing:

- Transformers used in distribution and transmission systems and large consumer installations.
- Transformers used in welding machines.
- Applications in appliances
- Risks and safety control measures associated with connection and disconnection of instrument transformers
- Safe working procedures when connecting and testing transformers.
- AS/NZS 3000 requirements and restriction on the installation and use of transformers.

T10 Ability to apply AS/NZ 3000 requirements for protection of circuit against overcurrent and abnormal voltages encompassing:

- Minimum fault levels specified by electricity distributors
- Methods and arrangement for protection against short-circuit currents and overload currents.
- Coordination of overload and short-circuit protection devices.
- Coordination between conductors and overload protection device.
- Causes of over and undervoltage.
- Device and requirements for protection against over and undervoltage.

T11 Additional protection by use of RCDs and use of extra-low voltage for basic

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

and fault protection encompassing:

- Limitation of an RCD to protect against contact with live parts
- AS/NZS 3000 requirements for use of RCDs.
- Conditions for use of extra-low voltage to provide for basic and fault protection
- AS/NZS 3000 requirements for installation of SELV and PELV systems

T12 Ability to apply AS/NZS 3000 requirements for control and protection of electrical apparatus and existing circuits encompassing:

- Devices for functions of isolation; emergency; Mechanical maintenance and functional control.
- Method for assessing prospective short circuit current.
- Devices and arrangement for protection against overload and short-circuit current.
- Additional protection by RCD
- Protection against switchboard internal arc faults.

T13 Knowledge of AS/NZS 3000 requirements for electrical apparatus and existing circuits in hazardous areas encompassing:

- Types of areas classified as a hazardous area
- Standards to which the maintenance of electrical equipment shall comply.
- Addition training required to work competently with electrical equipment for hazardous areas

T14 Ability to verify compliance of electrical apparatus and existing circuits in accordance with AS/NZS 3000 encompassing:

- Visual inspection to determine whether the electrical apparatus and existing circuits complies with requirements set out in Section 2 to 7 of AS/NZS 3000 and relevant specific installation standards.
- Mandatory tests following guidance given in AS/NZS 3017
- Portable tool safety testing and tagging system in accordance with AS/NZS 3760.

T15 Ability to perform effective safe isolation of any equipment encompassing:

- Preparation of a ‘safe work method statement’ (SWMS) or Job Safety Analysis (JSA) for effective safe isolation.
- Safe methods for identifying source of supply to be isolated.
- Switching-off, lock-out and tagging procedures.
- Safe methods for confirming effective and safe isolation

T16 Ability to apply AS/NZS 3000 requirements to carryout repairs and terminating thermoplastic insulated cables; elastomer sheathed cables; XLPE sheathed cables; and high temperature cables; armoured cables; and neutral screened cables in a wide range of applications.

T17 Ability to perform the circuit tests required for electrical cables in a range of installations and final sub-circuit encompassing:

- Following safe testing procedures.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Tests to show if the earth continuity and earth-fault loop impedance are sufficiently low.
- Testing to show if insulation resistance is sufficiently high.
- Testing to show if the polarity and circuit connections are correct.

T18 Ability to read, sketch and interpret electrical diagrams encompassing:

- Purpose and characteristics of schematic, block and wiring diagrams, plans and schedules.
- Conventions used in documenting electrical information
- Read and interpret schematic, block and wiring diagrams, plans and schedules
- Sketch electrical diagrams using conventional symbols

T19 Knowledge and understanding occupational safety and health encompassing:

- Basics of Occupational Safety and Health regulations
- Legal responsibilities for employers and employees
- Employers' and employees' own "duty of care".
- Safety committees and their role

T20 Knowledge and understanding of the requirements for personal safety in the workplace encompassing:

- Purpose and use of Safe Work Method Statements (SWMS) or Job Safety Analysis (JSA).
- Purpose and process of reporting OHS incidents.
- Safety procedures for working with electrical circuits and equipment.
- Procedures for safe and effective isolation of electrical supply.
- Regulations for the supervision of apprentices and trainees.

T21 Process in rescuing a person in contact with live electrical conductors or equipment and the primary importance of the safety of the rescuer.

T22 Application of emergency first aid requirements for an electric shock victim encompassing:

- Calling for help.
- Applying cardiopulmonary resuscitation (CPR).
- Selection and use of fire extinguishers to control electrical fire at accident site.

T23 Dangers of high voltage equipment and distribution systems encompassing:

- Step and touch and induced voltages.
- Sources of induced voltage and stored energy
- Creepage and clearance requirements.
- Application of safe working procedures in the vicinity of HV equipment.

T24 Systematic method of commissioning and decommissioning electrical equipment and existing circuits encompassing:

- Commissioning safety procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Circuit voltage testing
- Phase rotation checks
- Functional testing
- Instrument and control parameter settings
- Decommissioning safety procedures.
- Identification of circuits with their control and protection devices.
- Impact of isolation on other parts of an installation.
- Tagging, testing and earthing.
- Safe removal of equipment.

T25 Diagnosing and rectifying faults in electrical apparatus and existing circuits encompassing:

- Faults such as open-circuit; short-circuit; incorrect connections; insulation failure; unsafe condition; apparatus/component failure; related mechanical failure;
- Apparatus such as control devices; fixed appliances/accessories; lighting; electrical machines motors and controls; socket outlets, transformers; protection and metering devices.
- Circuits such as those supplying fixed appliances; lighting; socket outlets; motors and controls circuits; transformers; electronic or computer based equipment.

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit. It must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the

© Commonwealth of Australia, 2025 Powering Skills Organisation

normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

procedures and practices including the use of risk control measures as specified in the performance criteria and range statement

- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Verify compliance and functionality of general electrical apparatus and existing circuit installations as described as described in 8) and including:

A Selecting correct tools and testing equipment.

B Identifying visual non-compliance defects.

C Using effective methods for conducting mandatory and optional tests.

D Identifying non-compliance and functional defects from test results.

E Identifying causes of non-compliance and functional defects.

F Completing mandatory reporting.

G Dealing with unplanned events

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

© Commonwealth of Australia, 2025 Powering Skills Organisation

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to verifying compliance and functionality of electrical apparatus and existing circuits.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

There are no concurrent assessment recommendations for this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to verification and testing for at least two types of installations containing electrical apparatus and existing circuits comprising

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

an apparatus and existing circuit supplied by a single phase supply. The other installations shall include apparatus and existing circuits supplied by a three phase supply.

Unit Sector(s)

Not applicable.

Competency Field

Competency Field **11)**

Electrical

UEENEEH102A Repairs basic electronic apparatus faults by replacement of components

Modification History

Not applicable.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit deals the replacement of electronic components, cabling and sub systems of electronic apparatus. It encompasses safe working practices, following written and oral instruction and procedures, basic testing and techniques, dismantling and assembling apparatus and disconnecting and reconnecting components.

Application of the Unit

Application of the Unit **2)**

This unit may apply to persons entering work in electro technology and may be used in school based vocational programs.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace provided equipment is not connected to installation wiring at voltage above 50 V a.c. or 120 V d.c. However, practice in this unit is subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

Note:

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control, lifting equipment and the like. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting and risk safety measures

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle, assemble of utilities industry components

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading 3 Writing 3 Numeracy 3

© Commonwealth of Australia, 2025 Powering Skills Organisation

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Prepare to repair electronic apparatus.	1.1	OHS procedures for a given work area are identified, obtained and understood through established routines and procedures.
		1.2	Established OHS risk control measures and procedures are followed in preparation for the work.
		1.3	The nature of the repair is obtained from documentation or from work supervisor to establish the scope of work to be undertaken.
		1.4	Advice is sought from the work supervisor to ensure the work is co-ordinated effectively with others.
		1.5	Sources of materials that may be required for the work are established in accordance with established routines and procedures.
		1.6	Tools, apparatus and testing devices needed

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		to carry out the work are obtained and checked for correct operation and safety.
2 Repair electronic apparatus.	2.1	Established OHS risk control measures and procedures for carrying out the work are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits/apparatus are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Apparatus is dismantled in accordance with manufacturer's guide and supervisor's instructions.
	2.5	Component parts are tagged during the dismantling to help ensure correct and efficient reassembly and stored to protect them against loss or damage.
	2.6	Repairs are affected efficiently without damage to other components, apparatus or circuits.
	2.7	Apparatus is assembled in an appropriate sequence with all components parts placed, secured and connected in accordance with manufacturer's guide or industry practice.
	2.8	Procedures for referring non-routine events to immediate supervisor for directions are followed.
	2.9	Repairs are carried out efficiently without waste of materials or damage to apparatus and the surrounding environment or services and using sustainable energy practices.
3 Complete and report repair work activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Repaired apparatus is prepared and forwarded to appropriate person(s) for

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA
	testing.
	3.3 Work area is cleaned and made safe in accordance with established procedures.
	3.4 Work supervisor is notified of the completion of the repair work in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and carrying out basic repairs to electronic apparatus by replacement of components.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EH102A Component replacement to repair basic electronic apparatus faults

Evidence shall show an understanding of component replacement to repair basic electronic apparatus faults, applying safe working practices and relevant Standards, Codes and Regulations to an extent indicated by the following aspects:

T1. Electronic soldering equipment and techniques

- Workshop hazards and safety associated with soldering
- Quality concepts
- Electronic soldering equipment
- The soldering process
- Lead free solder

T2. Printed circuit board soldering techniques

- Electronic component mounting
- Solder rework of printed circuit boards.
- Faulty solder joints

T3. Soldering electronic cables

- Soldering multi-strand, ribbon and coaxial cables
- Effects and prevention of electrostatic discharge (ESD)

T4. Electronic component basics

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Types of components
- The physical features and primary characteristic of components
- Marking and codes on components
- Handling static sensitive components

T5. Electronic cable overview and coaxial cable

- Coaxial cables types and characteristics
- Coaxial cable termination

T6. Performance copper cables

- Twisted pair voice and data cables
- Insulation displacement (IDC) termination
- Colour codes
- Terminating performance cables
- Harness wiring

T7. Electronic apparatus components

- Fault finding
- Testing
- Replacement

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package. .

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of the unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment	**9.1)**
	Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it must

© Commonwealth of Australia, 2025 Powering Skills Organisation

include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accord with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work influence decisions about how/how much the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each Element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Implement Occupational Health and Safety workplace procedures and practices, including the use of risk control measures as specified in the performance criteria and range statement
- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Carry out basic repairs to electronic apparatus by replacement of components as described in 8) and including:

A Following manufacturer service instructions for access to components.

B Removing at least three different types of components specified in the work instructions.

C Replacing components to manufacturer requirements.

D Terminating correctly electronic cables using solderless termination techniques

E De-soldering and soldering to a high reliability standard and without damage to components.

F Reassembling the apparatus correctly.

G Testing apparatus operation.

H Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Context of and specific resources for assessment **9.3)**

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note: Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to carrying out basic repairs to electronic apparatus by replacement of components.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note: Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires that the specified essential knowledge and associated skills are assessed in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units **9.5)**

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

© Commonwealth of Australia, 2025 Powering Skills Organisation

UEENEEE102A	Fabricate, dismantle, assemble of utilities industry components

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to carrying out basic repairs electronic apparatus limited to replacement or repair of components, including sub systems in which the fault has been previously established.

At least two of the repairs shall require soldering and desoldering and at least two of the repairs shall require a cable to be correctly terminated using a solderless termination technique.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Not applicable.

Competency Field

Competency Field **11)**

UEENEEH111A Troubleshoot single phase input d.c. power supplies

Modification History

Release	Action	Core/Elective	Details	Points
3	Update		Correct Prerequisite title UEENEEH114A - Troubleshoot resonance circuits in an electronic apparatus	

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers determining correct operation of independent power supplies and power supply sections of electronic apparatus. It encompasses working safely, problem solving procedures, including the use of voltage, current and resistance measuring devices, providing solutions derived from measurements and calculations to predictable problems in d.c. power supplies with single phases input.

Application of the Unit

Application of the Unit **2)**

This competency standard unit is intended for development of competency in either entry-level employment based programs incorporated in approved contracts of training or other approved training programs. It may also be used to augment formally acquired competencies.

This unit is intended to apply to any recognised development program that leads to the acquisition of a formal award at AQF level 3 or higher.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace provided equipment is not connected to installation wiring at voltage above 50 V a.c. or 120 V d.c. However other conditions may apply in some States/Territories subject to regulations related to electrical work.

Practice in the workplace and during training is also subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control, lifting equipment and the like. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting and risk safety measures.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

Prerequisite Unit(s) **4)**

UEENEEE104A	Solve problems in d.c. circuits
UEENEEH102A	Repair basic electronic apparatus faults by replacement of components
AND	
UEENEEH114A	Troubleshoot resonance circuits in an electronic apparatus
OR	
UEENEEE119A	Solve problems in multiple path extra low voltage (ELV) a.c. circuits
OR	
UEENEEH169A	Solve problems in basic electronic circuits
OR	
UEENEEG101A	Solve problems in electromagnetic devices and related circuits
UEENEEG102A	Solve problems in low voltage a.c. circuits

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’.

Reading	3	Writing	3	Numeracy	3

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to troubleshoot d.c. power supplies.	1.1 OHS procedures for a given work area are obtained and understood.
	1.2 OHS risk control work preparation measures and procedures are followed.
	1.3 The nature of the fault is obtained from documentation or from work supervisor to establish the scope of work to be undertaken.
	1.4 Advice is sought from the work supervisor to ensure the work is co-ordinated effectively with others.
	1.5 Sources of materials that may be required for the work are established in accordance with established procedures.
	1.6 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2 Solve d.c. power	2.1 OHS risk control work measures and procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
supply problems.		are followed.
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3	Circuits are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4	Fault finding is approached methodically drawing on knowledge of dc power supplies using measured and calculated values of parameters.
	2.5	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.6	Fault finding activities are carried out efficiently without unnecessary waste of materials or damage to apparatus and the surrounding environment or services and using sustainable energy practices.
3 Complete work and document problem solving activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Justification for solutions used to troubleshooting problems is documented.
	3.4	Work completion is documented and an appropriate person or persons notified in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

Evidence shall show that knowledge has been acquired of safe working practices and troubleshooting d.c. power supplies with single phase input.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies..

KS01-EH111A Single phase input d.c. power supplies

Evidence shall show an understanding of single phase input d.c. power supplies , applying safe working practices and relevant Standards, Codes and Regulations to an extent indicated by the following aspects

T1. power supplies operating principles and applications

- Power supply function
- Block diagram identifying each sub-system
- Expected waveforms in a power supply
- Constant Voltage
- Constant Current

T2. D.C. rectification circuits

- Junction diode characteristics
- Transformer turns ratio and losses
- Half wave and full wave rectifiers
- Dual rail supply

T3. Filter circuits

- Capacitive and inductive filters
- Ripple

T4. Zener diode regulator

- Zener shunt regulator circuit
- Load and line regulation definitions
- Operating parameters and data sheets

T5. Three terminal regulator circuits

- Need for regulation
- Three terminal regulator characteristics
- Short circuit protection
- Line and load regulation
- Regulated power efficiency
- Remote voltage sensing

T6. Electronic testing and measuring devices and techniques

- Test/measuring devices and their application - analogue and digital multimeters, voltage and digital testers, signal generators and oscilloscopes
- Connection of test/measuring devices into a circuit encompassing:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- safety procedures
- circuit arrangement of test/measuring devices
- Taking readings
- Storage, maintenance and care of test/measuring devices

T7. D.C. power supply testing and fault finding

- Rectifier diode faults
- Zener diode faults
- Three terminal regulator faults

T8. OH&S

- Apply safe working practices and relevant Standards, Codes and Regulations

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of the unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it must include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accord with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the

© Commonwealth of Australia, 2025 Powering Skills Organisation

most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work influence decisions about how/how much the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each Element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices, including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be

© Commonwealth of Australia, 2025 Powering Skills Organisation

required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.

- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Troubleshoot d.c. power supplies with single phase input as described in 8) and including:

A Using methodical problem solving methods.

B Taking measurements correctly and accurately.

C Calculating parameters correctly and accurately.

D Providing solution to power supply problems, and

E Providing written justification for the solutions to problems.

F Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items.

Note:
Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to troubleshooting d.c. power supplies with single phase input.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires that the specified essential knowledge and associated skills are assessed in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

There are no concurrent assessment recommendations for this unit.

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

This unit shall be demonstrated in relation to troubleshooting d.c. power supplies with single phase input on the rectification section and filtering section of a half wave bridge rectifier and a full wave bridge rectifier.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Not applicable.

Competency Field

Competency Field **11)**

Electronics

UEENEEH114A Troubleshoot resonance circuits in an electronic apparatus

Modification History

Not applicable.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers determining correct operation of resonance circuits used in electronic apparatus. It encompasses working safely, problem solving procedures, including the use of voltage, current and resistance measuring devices, providing solutions derived from measurements and calculations to predictable problems in resonance circuits.

Application of the Unit

Application of the Unit **2)**

This competency standard unit is intended for development of competency in either entry-level employment based programs incorporated in approved contracts of training or other approved training programs. It may also be used to augment formally acquired competencies.

This unit is intended to apply to any recognised development program that leads to the acquisition of a formal award at AQF level 3 or higher.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

require a license to practice in the workplace provided equipment is not connected to installation wiring at voltage above 50 V a.c. or 120 V d.c. However other conditions may apply in some States/Territories subject to regulations related to electrical work.

Practice in the workplace and during training is also subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control, lifting equipment and the like. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting and risk safety measures.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace

AND

UEENEEE104A	Solve problems in d.c. circuits

© Commonwealth of Australia, 2025 Powering Skills Organisation

Prerequisite Unit(s) **4)**

OR

UEENEEH1 Solve problems in basic electronic circuits 69A

For the full prerequisite chain details for this unit please refer to Table 2 in Volume 1, Part 2

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 'Literacy and Numeracy'

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to troubleshoot resonance circuits.	1.1 OHS procedures for a given work area are obtained and understood.
	1.2 OHS risk control work preparation measures and procedures are followed.
	1.3 The nature of the fault is obtained from documentation or from work supervisor to establish the scope of work to be undertaken.
	1.4 Advice is sought from the work supervisor to ensure the work is co-ordinated effectively with others.
	1.5 Sources of materials that may be required for the work are established in accordance with established procedures.
	1.6 Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2 Solve in resonance circuits.	2.1 OHS risk control work measures and procedures are followed.
	2.2 The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3 Circuits are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4 Fault finding is approached methodically drawing on knowledge of resonance circuits using measured and calculated values of parameters.
	2.5 Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.6 Fault finding activities are carried out efficiently without unnecessary waste of materials or damage to apparatus and the surrounding environment or services and using sustainable

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		energy practices.
3 Complete work and document troubleshooting activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Justification for solutions used to troubleshooting problems is documented.
	3.4	Work completion is documented and an appropriate person or persons notified in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and troubleshooting frequency dependent circuits.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EH114A Resonance circuits troubleshooting

Evidence shall show an understanding of resonance circuit troubleshooting, applying safe working practices and relevant Standards, Codes and Regulations to an extent indicated by the following aspects:

T1. Basic engineering mathematics

- SI Units
- Using a calculator.
- Basic Algebra
- Applying the laws of indices.
- Simplification of expressions involving square roots.
- Graphs and tables.
- Pythagoras' Theorem and trigonometry ratios.

T2. Sinusoidal alternating voltage and current

- Generating a sinusoidal waveform
- Definition of the terms period, peak, peak-to-peak, instantaneous, average, and

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

root-mean-square value
- Calculating the instantaneous value of a sinusoidal waveform
- Calculating the root-mean-square value and frequency of a of a sinusoidal waveform
- Phase relationship between two or more sinusoidal waveforms
- Common waveforms used in electronic circuitry
- Observation of sinusoidal and other waveforms

T3. A.C. measuring equipment

- Operating principles of a cathode ray oscilloscope (CRO)
- Set up, calibration and use of a CRO
- Calibration and limitation of CRO probes
- Analogue and digital a.c. measuring instruments including true root-mean-square reading instruments
- Measurement of the instantaneous, peak, peak-to-peak values and period of sinusoidal and other common waveforms

T4. Phase relationships in a.c. circuits

- Phasor representation of sinusoidal waveforms
- Definitions of in-phase, out-phase, phase angle, lead and lag
- Phasor addition of two voltages or currents

T5. Resistive a.c. circuits

- Ohms law in a.c resistive circuits
- Current and voltage phase relationship
- Power dissipation

T6. Inductance in a.c. circuits

- Principles of inductance
- Units
- Inductive time constant circuits
- Inductive reactance
- Ohms law in inductive a.c. circuits
- Phase relationships
- Verification of operation of RC time constant circuit

T7. Capacitance in a.c. circuits

- Capacitive reactance
- Ohms law in capacitive a.c. circuits
- Current and voltage phase relationships

T8. Series a.c. circuits

- Definition of Impedance
- Impedance

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- The impedance triangle
- Voltages distribution
- Vector representation of current and voltages
- Verification of operation of series a.c. circuit

T9. Parallel a.c. circuits

- Current distribution
- Vector representation of voltage and currents
- Impedance calculations based on total circuit current and voltage
- Verification of operation of parallel a.c. circuit

T10. Series-parallel a.c. circuits

- Examples of circuit
- Rules for simplification

T11. Power factor

- Power triangle
- True power
- Apparent power
- Reactive power
- Power factor
- Power factor correction

T12. Ideal transformer

- Construction and operating principles
- Step-up, step-down, turns ratios, voltage and current ratios
- Autotransformer
- Core losses
- Types of cores and applications
- Volt-Ampere (VA) rating
- Verification of operation of transformer circuit

T13. Series resonance

- Conditions in a circuit that produce series resonance
- Relationship between resonance and frequency
- Impedance of a series resonant circuit
- Phasor representation of current and series voltage drops in series resonant circuit
- Voltage magnification
- The Q of a coil and its relevance
- Bandwidth and half power points in a resonant circuit
- Selectivity
- Verification of operation of series resonant circuit

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T14. Parallel resonance

- Conditions in a circuit that produce parallel resonance
- Impedance of a parallel resonant circuit
- Vector representation of voltage and parallel branch currents in a parallel resonant circuit
- Current magnification
- Verification of operation of parallel resonant circuit

T15. Filters

- Purpose of a filter
- Circuits for operation of the following passive filter circuits: high pass, low pass, band stop and band pass
- Bandwidth, attenuation, cut-off, roll off and order of filter
- Measurements and calculations relating to passive filters
- Curves showing the behaviour of various types of filter circuits
- Verification of operation of each filter type

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package. .

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of the unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it must include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that,

© Commonwealth of Australia, 2025 Powering Skills Organisation

in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accord with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work influence decisions about how/how much the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each Element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices, including the use of risk control measures as specified in the performance criteria and range

© Commonwealth of Australia, 2025 Powering Skills Organisation

statement

- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Troubleshoot frequency dependent circuits as described in 8) and including:

A	Using methodical problem solving methods.
B	Taking measurements correctly and accurately.
C	Calculating parameters correctly and accurately.
D	Providing solution to resonance circuit problems.
E	Providing written justification for the solutions to problems.
F	Dealing with unplanned events by drawing on essential knowle and skills to provide appropriate solutions incorporated in a ho assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evid on which competency is deemed. In these cases the alignment of outcomes of vendo training with performance criteria and critical aspects of evidence shall be clearly identified.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to troubleshooting frequency dependent circuits.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the industry to which this unit applies. This requires that the specified essential knowledge and associated skills are assessed in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units **9.5)**

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEE10 4A Solve problems in d.c. circuits

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to solving at least two of the following types of resonance circuit problems.

- Determining the operating parameters of an existing circuit
- Altering an existing circuit to comply with specified operating parameters
- Developing circuits to comply with a specified function and operating parameters

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Prepare to work on electronic circuits	1.1	OHS procedures for a given work area are obtained and understood.
		1.2	OHS risk control work preparation measures and procedures are followed.
		1.3	The nature of the circuit(s) problem is obtained from documentation or from work supervisor to establish the scope of work to be undertaken.
		1.4	Advice is sought from the work supervisor to ensure the work is co-ordinated effectively with others.
		1.5	Sources of materials that may be required for the work are established in accordance with established procedures.
		1.6	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
2	Solve electronic circuit problems	2.1	OHS risk control work measures and procedures are followed.
		2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
		2.3	Circuits are checked as being isolated where necessary in strict accordance OHS requirements and procedures.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	2.4	Established methods are used to solving circuit problems from measure and calculated values as they apply to electronic circuit.
	2.5	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.6	Problems are solved without unnecessary damage to apparatus, circuits, the surrounding environment or services and using sustainable energy practices.
3 Complete work and document problem solving activities	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Justification for solutions used to solve circuit problems is documented.
	3.4	Work completion is documented and an appropriate person or persons notified in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and solving problems in electronic circuits.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EH169A Electronics Circuit Principles

Evidence shall show an understanding of power supplies for electronics circuit principles, applying safe working practices and relevant Standards, Codes and Regulations to an extent indicated by the following aspects:

T1. Basic circuit configurations encompassing:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- circuit configurations are single source a.c. and d.c. circuits,
- series circuits,
- parallel circuits
- series-parallel circuits.

T2. The relationship between variable parameter in electrical /electronic circuits encompassing:

- Variables parameters –
  - voltage,
  - current,
  - resistance
  - impedance,
  - inductance,
  - capacitance
  - reactance.

T3. Behaviour of electrical /electronic circuits for various values of voltage, current, resistance, impedance, inductance, capacitance and reactance and variable parameters encompassing:

- single source circuits,
- series circuit configurations,
- parallel circuit configurations
- series-parallel circuit configurations

T4. Types of voltage testers, multimeters, clamp meters, continuity testers and insulation resistance testers and their application.

T5. Features of testing/measuring devices - safety, user calibration and parameter and range settings.

T6. Connection of test/measuring devices into a circuit encompassing:

- safety procedures
- circuit arrangement of test/measuring devices

T7. Taking readings

T8. Storage, maintenance and care of test/measuring devices.

T9. Australian Standard quality assurance requirements for test equipment calibration certification.

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package..

The Evidence Guide forms an integral part of this Competency Standard Unit and shall be used in conjunction with all components parts of this unit and, performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accord with Industry and, Regulatory policy in this regard.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Hence, sources of evidence need to be 'rich' in nature so as to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the "Assessment Guidelines – UEE11". Evidence shall also comprise:

A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:

- Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range; and
- Apply sustainable energy principles and practices as specified in the performance criteria and range; and
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements. and
- Demonstrate an appropriate level of skills enabling employment; and
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures; and

Demonstrated consistent performance across a representative range of contexts from the prescribed items below:

- Solving problems in electronic circuits as described in 8) and including:

a. Determining the operating parameters of an existing circuit.
b. Altering an existing circuit to comply with specified operating parameters.
c. Developing circuits to comply with a specified function and operating parameters.
d. Dealing with unplanned events by drawing on essential

© Commonwealth of Australia, 2025 Powering Skills Organisation

knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

OHS policy and work procedures and instructions.

- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this competency standard unit.

Resources required to assess this unit are listed above in Context of assessment', which should also be used in the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment it must ensure that the conditions for assessment are authentic and as far as possible reproduce and replicate the workplace and is consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to in solving problems in electronic circuits.

Method of assessment

9.4)

This competency standard unit shall be assessed by methods given in Volume 1, Part 3 "Assessment Guidelines".

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this competency standard unit applies. This requires that the specified essential knowledge and associated skills are assessed in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to use instrumentation drawings, specification, standards and equipment manuals.	1.1 Established OHS risk control measures and procedures are followed.
	1.2 The need for instrumentation drawings, specification, standards or equipment manuals is determined from the nature of the work to be undertaken.
	1.3 Established routines and procedures are followed to obtain instrumentation drawings, specification, standards or equipment manuals required for the work to be undertaken.
2 Use instrumentation	2.1 Instrumentation drawings, specification,

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
drawings, specification, standards and equipment manuals		standards and/or equipment manuals are selected, appropriate to the work being undertaken.
	2.2	Instrumentation drawings, specification, standards and equipment manuals are interpreted using knowledge of process controls and instrumentation drawing layouts, conventions and symbols.
	2.3	Dimensions are extracted from drawings and diagrams for application to work undertaken.
	2.4	Location of equipment is determined from instrumentation drawings and specification.
	2.5	Connections between pneumatic, hydraulic and electrical equipment are determined from instrumentation drawings and specifications
	2.6	Equipment manuals are reviewed to ascertain their format and where information relevant to the work to be undertaken is located.
	2.7	Information given in equipment manuals is interpreted in relation to the work to be undertaken.
3 Convey instrumentation information and ideas using drawings and diagrams.	3.1	Drawing conventions are used in neat freehand drawings to convey instrumentation information and ideas to others involved in the work to be undertaken.
	3.2	Instrumentation drawing conventions are used to neatly correct freehand original job drawing to show final ‘as-installed’ arrangement.
	3.3	Corrected drawings are forwarded to appropriate person(s) in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and using instrumentation drawings, specification, standards and equipment manuals.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EI101A Concepts and Practices of Industrial Instrumentation

Evidence shall show an understanding of the concepts of industrial instrumentation and the basic practices to an extent indicated by the following aspects:

T1 Industrial Instrumentation encompassing:

- Introduction to the purposes of measurement in industrial processes
- Instrument control loops
- Types of measurement in these processes
- Local and remote measurement
- Measurement signal methods
- Signal transmissions electrical standards
- Signal transmissions pneumatic standards
- Flow, temperature, pressure and other appropriate measurements.
- Identification and purpose of instruments measuring processes directly and those measuring indirectly.
- Instrumentation and control components: sensors, transducers, converters and transmitters.

T2 Instrument Standards encompassing:

- Instrumentation standards
- Relationship between standards
- Using standards
- Fluids in Process Piping Colour Coding.
- Instruments symbols

T3 Instrumentation Terminology and SI units encompassing:

- SI base units
- SI derived units
- Scientific notation and engineering notation
- SI prefixes.
- Instrumentation metric units
- Non-standard SI Units - kg/cm2, etc.
- Conversion of units
- Instrumentation terminology:
  - Span

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Range
- Accuracy
- Precision
- Errors
- Zero
- Repeatability
- Sensitivity
- Hysteresis

T4 Calibration of link and lever instruments encompassing:

- Principles of levers and links and calibration of indicator recorder instrument
- Calibration terms
- Calibrate a link and lever instrument
- Interpret calibration data so as to identify the types of error displayed by an instrument and whether the instrument is within its specified accuracy.
- Interpretation of graphs and tables associated with instrumentation

T5 Instrumentation safe working practices encompassing:

- Identification of instrumentation and control hazards
- Risk control measures for instrumentation work.
- Risk assessment

T6 Instrumentation drawings, diagrams and manuals encompassing:

- Electrotechnology drawing symbols for instrumentation and control (electrical/electronic circuits; Instrument circuits/diagrams; PLC diagrams; pneumatic; hydraulic)
- tandards used in Instrumentation drawings (ISA; ASME; AS; SAMA).
- Drawings used in Instrumentation - schematic; single line; wiring; PLC diagrams; process flow diagrams - brief instrument information; process loop diagrams - details, terminals, types of instruments.
- Manufacturers Data Sheets, Manuals, Specifications and Test Procedures - instrumentation Manuals, Catalogues and Drawings.
    - Interpretation of the specifications contained within instrumentation Manuals, Catalogues and Drawings.
    - Interpretation of the test procedures contained within instrumentation Manuals, Catalogues and Drawings.
    - Comparison of data presented in different forms for the same equipment.
    - Identification of data relevant to instrumentation from a range of publicity material.
    - Extraction of information such as calibration, testing or installation procedures from manuals, specification sheets and drawings.
- Quantity take-offs and Parts Lists

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Part Numbers for components, assemblies and equipment.
- Parts List for a specified project or installation from Manuals, Catalogues, Specifications and Drawings.
- List of equipment, required to undertake a specified project or installation, from Manuals, Catalogues, Specifications and Drawings.
- Identification and extraction of a Part Number for an actual sample component or part from a Manual, Catalogue, Specification and/or Drawing
- Sketching of instrumentation and control drawings:
  - Sketching a schematic circuit diagram from a given circuit board layout diagram, wiring or installation drawing and installation or modification of a specified project using information contained within Manuals,
  - Sketching a part or equipment layout needed to perform a specified task, such as installation or modification, from given Manuals, Catalogues, Specifications and Drawings

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of the unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and

© Commonwealth of Australia, 2025 Powering Skills Organisation

regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work influence how/how much the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit shall be considered holistically. Each Element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices, including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Use instrumentation drawings, specification, standards and equipment manuals as described in 8) and including:

A Identifying instrumentation drawings, specification, standards and equipment manuals relevant to the work to be undertaken.

B Interpreting instrumentation drawings, specification, standards and equipment manuals using knowledge of process controls and instrumentation drawing layouts, conventions and symbols.

C Determining location of equipment from instrumentation drawings and specification

D Determining connections between pneumatic, hydraulic and electrical equipment correctly

E Using correct conventions in freehand drawings.

F Giving correct information in freehand drawings.

G Dealing with unplanned event

Context of and specific resources for assessment

9.3)

This unit must be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment

© Commonwealth of Australia, 2025 Powering Skills Organisation

environment.

Note: Where simulation is considered a suitable strategy for assessment, the conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to instrumentation drawings, specification, standards and equipment manuals

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note: Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit must be demonstrated in relation to instrumentation assembly, installation,

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

fault finding, maintenance or development work functions using at instrumentation drawings, specification, standards and equipment manuals for least two different process control systems

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Not applicable.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers the installation and termination of instrument and control cabling and tubing for chemical, industrial or food processing systems or equipment used in medical procedures. It encompasses working safely and to standards, routing cables and tubing to specified locations, terminating cables and tubing and connecting wiring at accessories and at instruments and control apparatus and completing the necessary installation documentation.

Application of the Unit

Application of the Unit **2)**

© Commonwealth of Australia, 2025 Powering Skills Organisation

This unit covers the installation and termination of instrument and control cabling and tubing for chemical, industrial or food processing systems or equipment used in medical procedures. It encompasses working safely and to standards, routing cables and tubing to specified locations, terminating cables and tubing and connecting wiring at accessories and at instruments and control apparatus and completing the necessary installation documentation.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit require a license to practice in the workplace where plant and equipment operate at voltage above 50 V a.c. or 120 V d.c. However other conditions may apply in some jurisdictions subject to regulations related to electrical work. Practice in the workplace and during training is also subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space and lifting and risk safety measures.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

© Commonwealth of Australia, 2025 Powering Skills Organisation

Prerequisite Unit(s) **4)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEI101A	Use instrumentation drawings, specification, standards and equipment manuals

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading	3	Writing	3	Numeracy	3

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA	
1 Prepare to install cabling and tubing	1.1	OHS procedures for a given work area are identified, obtained and understood
	1.2	Health and safety risks are identified, and established risk control measures and procedures in preparation for the work are followed.
	1.3	Safety hazards that have not previously been identified are noted, and established risk control measures are implemented.
	1.4	Installation of cabling and tubing is prepared in consultation with other affected by the work and sequenced appropriately.
	1.5	The nature and location of the work is determined from documentation or appropriate person(s) to establish the scope of work to be undertaken.
	1.6	Cable and tube routes are planned within the constraints of the building and plant structure, significants and regulations.
	1.7	Advice is sought from appropriate persons to ensure the work is coordinated effectively with others.
	1.8	Material needed for the installation work is obtained in accordance with established procedures and checked against job requirements.
	1.9	Tools, equipment and testing devices needed to for the installation work are obtained in accordance with established procedures and

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		checked for correct operation and safety.
	1.10	Preparatory work is checked to ensure no damage has occurred and that work complies with requirements.
2 Install cabling, tubing and accessories	2.1	OHS risk control measures and procedures for carrying out the work are followed.
	2.2	Plant/machines/equipment are checked as being isolated where necessary in strict accordance OHS requirements and procedures
	2.3	Cabling, tubing and accessories are installed to comply with technical standards and job specifications and requirements with sufficient excess to affect terminations.
	2.4	Accessories are installed in the required locations and within acceptable tolerances.
	2.5	Cables and conductors are terminated at accessories in accordance with manufacture’s specifications and regulatory requirements
	2.6	Tubing is terminated at accessories in accordance with manufacture’s specifications and regulatory requirements
	2.7	Established methods for dealing with unexpected situations are discussed with appropriate person or persons and documented.
	2.8	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.9	Ongoing checks of the quality of installed wiring are undertaken in accordance with established procedures.
	2.10	Cabling and tubing installation is carried out efficiently without waste of materials and energy or damage to apparatus, the surrounding environment or services and using sustainable energy principles.
3 Completion and	3.1	OHS work completion risk control measures and

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
report installation activities		procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Final checks are made to that the installed wiring conforms to requirements.
	3.4	'As-installed' cables, tubes and accessories are documented and appropriate person(s) notified in accordance with established procedures

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the required skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and installing instrumentation and control cabling and tubing.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EI107A Instrumentation and control cables, conductors and tubing

Evidence shall show an understanding of instrumentation and control cables, conductors and tubing to an extent indicated by the following aspects:

T1 Instrumentation cable types and terminations encompassing:

- Cable specifications
- Cable applications
- Cable preparation
- Cable termination
- Connection hardware

T2 Instrumentation pneumatic/hydraulic control tubing/piping encompassing:

- Control tubing/piping
- Pneumatic/hydraulic terms
- Cutting pipe tubing/piping

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Bending, shaping/setting pipe and tubing
- Joining connecting/terminating tubing/piping
- Instrumentation air supply maintenance

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of the unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be ‘rich’ in nature to minimise error in judgment.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Activities associated with normal everyday work influence how/how much the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit shall be considered holistically. Each Element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices, including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the required skills and knowledge as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Install instrumentation and control cabling and tubing as listed as described in 8) and including:

A Reading and interpreting drawings related to cable and tube layouts, schedules and control apparatus locations

B Routing, placing and securing cables and tubing to comply with requirements

C Placing and securing accessories accurately

D Maintaining fire integrity

E Terminating cables and tubing to comply with requirements

F Dealing with unplanned events by drawing on required skills and knowledge to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified

Context of and specific resources for assessment

9.3)

This unit must be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment,

© Commonwealth of Australia, 2025 Powering Skills Organisation

the conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to installing instrumentation and control cabling and tubing.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the required skills and knowledge described in this unit.

Concurrent assessment and relationship with other units

9.5)

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEI108A	Install instrumentation and control apparatus and associated equipment

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

situations that will affect performance.

This unit must be demonstrated in relation to at least three different wiring systems and two types of tubing.

Note:

1. Examples of wiring systems include armoured cable; fire performance cables e.g. MIMS; thermoplastic insulated cable; thermoplastic sheathed cable; UTP, FTP, STP and coaxial communications cables.

2. Tubing types include low pressure metallic and non-metallic tubing and high pressure tubing

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EI108A **Instrumentation and control equipment installation requirements and techniques**

Evidence shall show an understanding of instrumentation and control equipment installation requirements and techniques to an extent indicated by the following aspects:

Regulatory requirements

- Equipment specification
- Manufacturer’s installation instructions
- System specifications
- Communication/signal cabling installation requirements
- Power wiring requirements
- Initial set up procedures

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of the unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships.

© Commonwealth of Australia, 2025 Powering Skills Organisation

However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work influence how/how much the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit shall be considered holistically. Each Element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Implement Occupational Health and Safety workplace procedures and practices, including the use of risk control measures as specified in the performance criteria and range statement
- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Install instrumentation and control apparatus and associated equipment as listed as described in 8) and including:

A	Reading and interpreting drawings related to and apparatus locations and tubing electrical circuit connections.
B	Placing and securing apparatus accurately
C	Connecting apparatus and associated equipment to comply with requirements.
D	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Context of and specific resources for assessment

9.3)

© Commonwealth of Australia, 2025 Powering Skills Organisation

This unit must be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, the conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to installing instrumentation and control apparatus and associated equipment.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications

© Commonwealth of Australia, 2025 Powering Skills Organisation

UEENEEI107A	Install instrumentation and control cabling and tubing

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance

This unit must be demonstrated in relation to at least four different instrumentation and control apparatus and associated equipment.

- pressure measurement apparatus and systems,
- temperature measurement apparatus and systems,
- level/density measurement apparatus and systems,
- flow measurement apparatus and systems, and
- chemical measurement apparatus and systems.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers assembling and entering instructions in microprocessor-equipped devices (embedded system) with simple built-in programming function and verifying that the device operates as intended. It encompasses safe working practices, checking device installation, following written and oral instruction and procedures and completing necessary documentation.

Note:

Examples of devices are simple programmable relays, timers, temperature controllers, switches and basic detection devices for security and fire the like.

Application of the Unit

Application of the Unit **2)**

This unit is intended for competency development

© Commonwealth of Australia, 2025 Powering Skills Organisation

entry-level employment-based programs incorporated in approved contracts of training. It may be used to augment previously acquired competencies.

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control, lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus, site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting and risk safety measures.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace. However, practice in this unit is subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health Safety regulations, codes and practices in the workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 'Literacy and Numeracy'

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to assemble and enter operating instructions.	1.1 OHS procedures for a given work area are identified, obtained and understood through established routines and procedures.
	1.2 Established OHS risk control measures and procedures are followed in preparation for the work.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.3	Safety hazards that have not previously been identified are reported and advice on risk control measures is sought from the work supervisor.
	1.4	Work supervisor or customers are consulted to determine which functions of the device are to be use and the parameter of each
	1.5	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
	1.6	Device installation is checked for compliance with job specification and regulations where they apply.
2 Assemble and enter operating instructions.	2.1	Established OHS risk control measures and procedures for carrying out the work are followed.
	2.2	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.3	The required status of each function of the device is entered and their parameters set in accordance with manufacturer programming instructions.
	2.4	Entered data are checked as meeting those specified by the work supervisor or customer.
	2.5	Procedures for referring non-routine events to immediate supervisor for directions are followed.
	2.6	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
3 Test device operation and report.	3.1	Device operation is tested in strict accordance OHS requirements and procedures.
	3.2	Operating anomalies are identified and corrected in accordance with established routines.
	3.3	OHS work completion risk control measures and

ELEMENT	PERFORMANCE CRITERIA
	procedures are followed.
	3.4 Work site is cleaned and made safe in accordance with established procedures.
	3.5 Work completion is reported and appropriate person(s) notified in accordance with established routines.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the required skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and entering and verifying operating instruction in basic microprocessor equipped devices.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EI116A Microprocessor equipped devices

Evidence shall show an understanding of microprocessor equipped devices to an extent indicated by the following aspects:

T1 Overview of digital controllers

- types
- block diagram of controller
- applications
- terms

T2 Controller input and output equipment

- input sensors (transducers)
- current loop concepts
- output current and voltage ratings
- supplementary solid state relays/ contactors

T3 Installation of controllers

- types of input sensors
- wiring

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- mounting techniques
- terminal types
- output current protection

T4 Configuration and digital controller set-up

- operator interfaces
- manufacturer's data
- testing

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being

© Commonwealth of Australia, 2025 Powering Skills Organisation

assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices, including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the required skills and knowledge as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Enter and verify operating instructions in microprocessor equipped devices as described in 10) and including:

A Understanding required operating functions and parameters.

B Identifying non-compliance conditions of device installation.

C Entering functions and parameters correctly.

D Correcting programming anomalies.

E Testing and verify device operation.

F Dealing with unplanned events by drawing on required skills and knowledge to provide appropriate solutions incorporated in a holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed in this unit.

These should be used in the formal learning/assessment

© Commonwealth of Australia, 2025 Powering Skills Organisation

environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions for assessment must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to enter and verifying operating instructions in microprocessor equipped devices.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the required skills and knowledge described in this unit.

Concurrent assessment and relationship with other units

9.5)

There are no concurrent assessment recommendations for this unit.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to develop enter and verify program.	1.1 OHS procedures for a given work area are identified, obtained and understood through established routines and procedures.
	1.2 Established OHS risk control measures and procedures are followed in preparation for the work.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.3	Safety hazards that have not previously been identified are reported and advice on risk control measures is sought from the work supervisor.
	1.4	Control system scenario is determined from job specifications of the process/plant/machine to be controlled, and through consultation with appropriate person(s).
	1.5	Equipment, software and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
	1.6	Installation of programmable controller is checked for compliance with regulations and job specification.
2 Develop control system and enter and test program.	2.1	Established OHS risk control measures and procedures for carrying out the work are followed.
	2.2	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.3	Control solutions are developed and documented based on the specified control mode and using acceptable methods for designing control systems.
	2.4	Developed control system is converted to an appropriate form, such as flow, state and ladder diagrams(See Note 1)
	2.5	Program is entered into the programmable control using a personal computer and appropriate software.
	2.6	Entered instructions and settings are tested as meeting those specified in by the control system scenario.
	2.7	Appropriate methods and tools are used to

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		test control systems and operating faults and anomalies are identified and rectified. (See Note 2)
	2.8	Methods for dealing with unexpected situations are selected on the basis of safety and specified work outcomes.
3 Verify, document and report programming activities.	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Program is transferred from a programmable controller to an external medium for storage. (See Note 3)
	3.3	Control system specification and program are documented in accordance with established procedures.
	3.4	Work completion is reported and appropriate personnel notified in accordance with established procedures.

Note.

1. Example of control functions are derived timers (off delay, self resetting, constant duty cycle), reversible counters, cascading timers, cascading counters, combining timers and counters, internal relays/flags/markers, latching relays (set/reset), jump instructions, master control instructions, bit shift registers, scan time considerations, one shot, retentive (power fail) functions, simple step sequence instructions

2. Examples of control system testing methods and tools are monitor mode as an aid to fault finding, inbuilt hardware/software diagnostics and use of error codes.

3. Examples of storage mediums are IC storage, hard disks, servers.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the required skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and developing, entering and verifying discrete control programs for programmable logic controllers.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EI150A Programmable controller

Evidence shall show an understanding of programmable controller to an extent indicated by the following aspects:

T1. PLC Introduction encompassing:

- Evolution of the programmable controller and applications
- Relay control, static logic control and programmable control
- Programmable controller block diagram (Inputs and Outputs)
- Programmable controller advantages
- Programmable controller symbols
- Programmable controller functions
- Numbering systems start-up procedures
- Programming inputs and outputs
- Operation of programmable controller inputs
- PLC operation: scan cycle
- Basic programming

T2. Types of PC programs encompassing:

- Ladder diagrams
- Basic Programming
- Program modification
- Ladder diagram development
- Connecting the programmable controller.

T3. Programming Timers encompassing:

- Purpose of timers
- Timer instructions
- On-delay timer instruction
- Off-delay timer instruction
- Programming timers
- Retentive and non-retentive timers
- Cascading timers
- The self-resetting timer
- Monitoring timers

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Circuit conversion

T4. Programming Counters encompassing:

- Counter instructions
- Retentive and non-retentive counter
- Programming counters
- Up/down counters
- Self resetting counter
- Cascading counters
- Circuit conversion

T5. Program Storage encompassing:

- PLC terms
- Memory
- Using the PROM pack
- Printing ladder diagrams

T6. PLC Input and Output Modules encompassing:

- Purpose of modules

T7 PLC input modules:

- dry contact input modules;
- AC input modules, DC input modules;
- Analog input modules

T8 Output modules:

- relay output;
- Triac output;
- transistor output;
- analog output modules

T9. PLC Installation Requirements encompassing:

- Installation precaution
- Safety systems
- AS/NZS requirements
- Mounting the PLC
- Installation documentation
- Routing signal and power cables
- Locating PLCs and I/O
- Earthing Requirements

T10. Master Control encompassing:

- Master control relay
- Master control relay ladder diagram

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Programming master control relays

T11. Jump Function encompassing:

- Jump function
- Jump function ladder diagram
- Programming jump functions

T12. The Shift Register encompassing:

- Purpose of Registers
- The shift register
- Shift register operation
- Clock input
- Shift register requirements
- Programming shift registers

T13. The Step Sequencer encompassing:

- Step Sequencers
- Step sequencer operation
- Clock input
- Step Sequencer requirements
- Programming step sequencer

T12. PLC Diagnostics and Fault Finding encompassing:

- PLC Fault Finding
- Controller Status
- I/O Faults
- Program Faults

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of 9.1)

© Commonwealth of Australia, 2025 Powering Skills Organisation

Assessment

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria

© Commonwealth of Australia, 2025 Powering Skills Organisation

shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices, including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the required skills and knowledge as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Develop, enter and verify programs for programmable controllers as described in 8) and including:

A	Developing a control system solution to the required operating functions and parameters.
B	Identifying non-compliance conditions of device installation.
C	Converting control system to a PLC program.
D	Entering programming functions and parameters correctly.
E	Transferring programs to a PLC.
F	Correcting programming anomalies.
G	Testing and verify control system operation.
H	Transferring program to external storage.

I	Documenting control system and programming clearly.
J	Dealing with unplanned events by drawing on required skills and knowledge to provide appropriate solutions incorporated in a holistic assessment with the above listed items.

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

Context of and specific resources for assessment **9.3)**

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed in this unit.

These should be used in the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions for assessment must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to developing, entering and verifying programs for programmable logic controllers using ladder instrument set.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the required skills and knowledge described in this unit.

Concurrent assessment and relationship with other units

9.5)

There are no concurrent assessment recommendations for this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to developing, entering and verifying programs for programmable logic controllers. The program shall include at least five of the following functions/controls:

- Derived timers (off delay)
- Self resetting
- Constant duty cycle
- Reversible counters
- Cascading timers
- Cascading counters
- Combining timers and counters
- Internal relays/flags/markers
- Latching relays (set/reset)
- Jump instructions
- Master control instructions
- Bit shift registers
- Scan time considerations
- One shot

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

- Retentive (power fail) functions
- Simple step sequence instructions

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health Safety regulations, codes and practices in the workplace
UEENEEK102A	Work safely with remote area power supply systems

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading	3	Writing	3	Numeracy	3

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a	Performance Criteria describe the required performance needed to demonstrate achievement of the element.

© Commonwealth of Australia, 2025 Powering Skills Organisation

competency standard unit	Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to maintain safety and tidiness of RAPS system	1.1 OHS procedures for a given work area are identified, obtained and understood through established routines and procedures
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed.
	1.3 Safety hazards which have not previously been identified are reported and advice on risk control measures is sought from the work supervisor.
	1.4 The nature and location of the RAPS system is obtained from work schedule and supervisor to establish the scope of work to be undertaken.
	1.5 Advice is sought from the work supervisor to ensure the work is coordinated effectively with fellow workers and the local community.
	1.6 Tools and equipment needed to carry out the cleaning work are obtained and checked for correct operation and safety
2 Maintain safety and tidiness of RAPS system	2.1 Established OHS risk control measures and procedures for carrying out the work are followed.
	2.2 The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures.
	2.3 Circuits/machines/system are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
	2.4 Routine procedures are used to clean RAPS system and area.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	2.5	Cleaning is carried out efficiently without waste of materials and energy or damage to apparatus, circuits, the surrounding environment or services.
	2.6	Routine quality checks are carried out in accordance with work instructions.
3 Complete work and report	3.1	OHS risk control work completion measures and procedures are followed.
	3.2	Procedures for referring cleaning and tidiness issues to the local community are followed.
	3.3	Completion of cleaning work and issues are reported to work supervisor in accordance with established routines.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and maintaining safety and tidiness of remote area power supply (RAPS) systems

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK101A RAPS plant area cleaning

Evidence shall show an understanding of cleaning and maintaining remote area power supply (RAPS) systems to an extent indicated by the following aspects:

- Needs for a clean and tidy plant area
- RAPS system components and associated equipment and their location within the plant area
- manual fuel pump if available
- Plant cleaning techniques:
  - Fuel and oil
  - acid spills;

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- removal of dust, insects, spiders, animals
- removal of non-RAPS equipment
- Technique for reporting and dealing with cleaning issues.

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous substance/material present a challenge for those determining competence. Sources of evidence need to be ‘rich’ in nature to

© Commonwealth of Australia, 2025 Powering Skills Organisation

minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit must be considered holistically. Each element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence must also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this must incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Maintain safety and tidiness of remote area power supply systems as described in 8) and including:

A	Removing non-RAPS equipment
B	Safely removing insects, spiders and any animals
C	Safely removing dust and dirt from floors and equipment
D	Identifying and reporting at least two safety issues
E	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to maintaining safety and tidiness of remote area power supply systems.

Method of

9.4)

© Commonwealth of Australia, 2025 Powering Skills Organisation

assessment

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5) There are no concurrent assessment recommendations for this unit.

For optimisation of training and assessment effort, competence in this unit may be assessed concurrently with units UEENEEE101A Apply Occupational Health Safety regulations, codes and practices in the workplace

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit must be demonstrated in relation to least two different RAPS systems incorporating a battery bank and at least two of the following:

- Generator set
- Photo voltaic array
- RAP system
- Wind generator

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers safety practices for working on remote area power supply (RAPS) systems. It encompasses identifying safety hazards, using risks control measures and following routine procedures for prescribed system maintenance.

Note:
Components of this unit are included in the critical aspects of evidence in each applicable unit to ensure that OHS practices are demonstrated as they apply to RAPS system servicing work functions and situations

Application of the Unit

Application of the Unit **2)**

This unit is intended primarily for indigenous persons seeking qualifications in RAPS system servicing. The unit may also be applied to work entry qualifications in renewable energy service work in general and be used in school-based vocational programs.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace. However,

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

practice in this unit is subject to regulations directly related to occupational health and safety and contracts of training such as new apprenticeships

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed

UEENEEE101A	Apply Occupational Health Safety regulations, codes and practices in the workplace

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Prepare to enter a RAPS system	1.1	Instruction in hazards and risk control measures for RAPS systems maintenance are identified, obtained and understood.
		1.2	System access permit is obtained from work supervisor.
		1.3.	Preparations for electrical and non-electrical isolation are made to prevent creation of hazards
		1.4	Tools and equipment needed for the work are checked for safety and correct functionality according to established safety routines.
2	Apply safe working practices in RAPS system area.	2.1	Workplace procedures and work instructions for controlling risk are followed accurately.
		2.2	Workplace procedures for dealing safe working practices in RAPS system are followed according to prescribed work procedures.
		2.3	Circuits/machines/system are checked as being isolated where necessary in strict accordance OHS requirements and procedures.
		2.4	Routine procedures are used to apply safe working practices in RAPS system and area.
		2.5	Safe working practices are carried out efficiently without waste of materials and energy or damage to apparatus, circuits, the surrounding environment or services.
		2.6	Routine quality checks are carried out in accordance with work instructions.
3.	Follow workplace procedures for hazard identification and risk control in RAPS system areas	3.1	Hazards are identified and prescribed control measures implemented and monitored through active participation in the consultation process with employer, other employees and local community.

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA
	3.2 Hazards in the work are recognised and reported to work supervisor personnel according to established procedures.
	3.3 OHS records of incidents are completed in accordance with regulatory requirements and established procedures
	3.4 Workplace instructions and training are followed accurately within established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and working safely with remote area power supply (RAPS) systems.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK102A Remote area power supply safe working practice

Evidence shall show an understanding of RAPS safe working practices to an extent indicated by the following aspects:

General safety encompassing:

- General safety
- Risk assessment
- Personal protective equipment
- OHS procedures

RAPS safety and risk assessment encompassing:

- Types of hazards in and around remote area power supplies

Note: In addition to the safety hazards found in most workplace RAPS systems are likely to have the hazards related to electricity supplied from more than one source, rotating machines, fuels and oils, exhaust fumes, and acids and flammable gases from batteries.

- Measures for dealing with hazards in and around remote area power supplies

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Purpose and methods for isolation and de-energisation of power supplies

Correct isolation and de-energisation procedures encompassing:

- Processes for preventing generator from automatically starting
- Isolating photo voltaic arrays,
- Isolating wind driven generators,
- Isolating battery
- Isolating inverter power sources

Safety signage encompassing:

- Types of signs
- Location
- Condition
- Suitability

Access to system encompassing:

- Methods for limiting access to plant areas

Reporting

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships.

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers maintenance of remote area power supply (RAPS) generator sets where the exposed voltage is not greater than 50 V a.c. or 120 V d.c. It encompasses working safely and to maintenance standards and following maintenance routines, identifying known types of generator faults using routine procedures and completing the necessary maintenance reporting

Application of the Unit

Application of the Unit **2)**

This unit is intended primarily for indigenous persons seeking qualifications in RAPS system servicing. The unit may also be applied to work entry qualifications in renewable energy service work in general and be used in school-based vocational programs.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

require a license to practice in the workplace. However, practice in this unit is subject to regulations directly related to occupational health and safety and contracts of training such as new apprenticeships.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, dismantle, assemble of utilities industry components
UEENEEK101A	Maintain safety and tidiness of remote area power supply systems
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEK102A	Work safely with remote area power supply systems
UEENEEE131A	Solve problems in ELV circuits for non electrical workers

OR

UEENEEE104A	Solve problems in d.c. circuits

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in

© Commonwealth of Australia, 2025 Powering Skills Organisation

this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 'Literacy and Numeracy'

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to conduct periodic maintenance on generator sets	1.1 OHS procedures for a RAPS plant are identified, obtained and understood through established routines and procedures
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed
	1.3 Safety hazards which have not previously been identified are reported and advice on risk control measures is sought from the work supervisor

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.4	The nature and location of RAPS system is identified from documentation or from work supervisor to establish the scope of work to be undertaken
	1.5	Advice is sought from the work supervisor to ensure the work is coordinated effectively with fellow workers and the local community
	1.6	Sources of materials that may be required for the work are identified and accessed in accordance with established routines and procedures
	1.7	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety
2 Maintain RAPS systems generator sets	2.1	Established OHS risk control measures and procedures for carrying out the work are followed
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures
	2.3	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures
	2.4	Prescribed maintenance procedures are used to test and check RAPS system generator sets
	2.5	Generator set maintenance, including performance measurements and repairs, are carried out safely and to prescribed routines and procedures
	2.6	Known types of generator set functional faults are identified using routine fault finding procedures
	2.7	Procedures are followed for referring non-routine events to immediate supervisor for directions
	2.8	Maintenance and repair work is carried out

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		efficiently without waste of materials and energy and without damage to apparatus, circuits, the surrounding environment or services
	2.9	Routine quality checks are carried out in accordance with work instructions.
3 Complete maintenance work of generator sets and report	3.1	OHS work completion risk control measures and procedures are followed
	3.2	Work site is cleaned and made safe in accordance with routine procedures
	3.3	Procedures for referring local maintenance issues to the community are followed
	3.4	Generator set performance measurements are reported to the work supervisor through the established maintenance reporting procedures

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and conducting periodic maintenance of remote area power supply (RAPS) generator sets.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK104A RAPS system generator sets maintenance techniques

Evidence shall show an understanding of maintaining remote area power supply generator sets to an extent indicated by the following aspects:

T1 Basic generator set maintenance encompassing:

- Checking of radiator and oil level;
- Periodic oil change
- Periodic air, oil and fuel filter change.
- Maintaining log books for maintenance regime

© Commonwealth of Australia, 2025 Powering Skills Organisation

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous substance/material present a challenge for those determining competence. Sources of evidence need to be ‘rich’ in nature to minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its ‘richness’. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the

© Commonwealth of Australia, 2025 Powering Skills Organisation

assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit must be considered holistically. Each element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence must also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this must incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Conduct periodic maintenance of remote area power supply (RAPS) generator sets as described in 8) and including:

A Measuring and recording generator no-load and

© Commonwealth of Australia, 2025 Powering Skills Organisation

	load voltages
B	Measuring and recording generator output for three load conditions
C	Checking drive engine coolant and oil level
D	Visually inspecting drive engine for coolant and oil leaks
E	Checking condition of drive engine oil, oil filter and air filter
F	Identifying need to change drive engine oil, oil filter and air filter
G	Changing drive engine oil, oil filter and air filter
H	Topping up low coolant and oil levels
I	Identifying the cause of any coolant and oil leaks
J	Reporting all maintenance activities
K	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and

© Commonwealth of Australia, 2025 Powering Skills Organisation

replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to conducting periodic maintenance of remote area power supply (RAPS) generator sets.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units **9.5)**

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEK103A	Conduct periodic maintenance of remote area power supply battery banks
UEENEEK105A	Conduct periodic maintenance of remote area power supply photo voltaic arrays
UEENEEK106A	Conduct periodic maintenance of remote area power supply wind generators

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit must be demonstrated in relation to least two different RAPS systems in which the generator set is charged from a generator set and a photo voltaic array and at least one similar RAPS system where the generator set is charged form a wind generator.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

C	Visually inspecting generator and support structure for physical damage;
D	Visually inspecting generator connections and cables;
E	Identifying generator defects and faults;
F	Reporting all maintenance activities
G	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to conducting periodic maintenance of remote area power supply (RAPS) wind generators.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3

© Commonwealth of Australia, 2025 Powering Skills Organisation

'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEK103A	Conduct periodic maintenance of remote area power supply battery banks
UEENEEK104A	Conduct periodic maintenance of remote area power supply generator sets
UEENEEK105A	Conduct periodic maintenance of remote area power supply photo voltaic arrays

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit must be demonstrated in relation to at least two different RAPS systems in which the battery bank is charged from a generator set and a wind generator.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers installation of remote area power supply (RAPS) systems where the exposed voltage is not greater than 50 V a.c. or 120 V d.c. It encompasses working safely and to installation standards, matching equipment with that specified for a given location, placing and securing equipment accurately, making required circuit connections and completing the necessary installation documentation.

Application of the Unit

Application of the Unit **2)**

This unit is intended for competency development entry-level employment-based programs incorporated in approved contracts of training.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace. However, practice in this unit is subject to regulations directly related to occupational health and safety and contracts of training such as new apprenticeships.

Note:

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting, risk safety measures etc

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace
UEENEEE102A	Fabricate, assemble and dismantle utilities industry components
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEE108A	Lay wiring/cabling and terminate accessories for extra-low voltage (ELV) circuits

And

UEENEEE131A	Solve problems in ELV circuits for non electrical workers

OR

UEENEEE1	Solve problems in d.c. circuits

Prerequisite Unit(s) **4)**

04A

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 'Literacy and Numeracy'

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to install remote area power	1.1 OHS procedures for a given work area are identified, obtained and understood

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
supplies	1.2	Health and safety risks are identified, and established risk control measures and procedures are followed in preparation for the work
	1.3	Safety hazards that have not previously been identified are noted, and established risk control measures are implemented
	1.4	Installation of apparatus is prepared in consultation with others effected by the work and sequenced appropriately
	1.5	The nature and location of the work is determined from documentation or appropriate persons to establish the scope of work to be undertaken
	1.6	Locations of apparatus and associated equipment is planned within the constraints of the building structure, significants and regulations
	1.7	Advice is sought from appropriate persons to ensure the work is coordinated effectively with others
	1.8	Material needed for the installation work is obtained in accordance with established procedures and checked against job requirements
	1.9	Tools, equipment and testing devices needed for the installation work are obtained in accordance with established procedures and checked for correct operation and safety
	1.10	Preparatory work is checked to ensure no damage has occurred and that it complies with requirements
2 Install remote area power supplies	2.1	OHS risk control measures and procedures for carrying out the work are followed
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures
	2.3	Circuits/machines/plant are checked as being

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		isolated where necessary in strict accordance OHS requirements and procedures
	2.4	Apparatus and associated equipment are installed to comply with technical standards and job specifications and requirements with sufficient access to affect terminations, adjustment and maintenance
	2.5	Wiring is terminated at apparatus and associated equipment in accordance with manufacturer specifications and functional and regulatory requirements
	2.6	Established methods for dealing with unexpected situations are discussed with appropriate person or persons and documented
	2.7	Unexpected situations are dealt with safely and with the approval of an authorised person.
	2.8	Ongoing checks of the quality of installed apparatus are undertaken in accordance with established procedures
	2.9	Apparatus installation is carried out efficiently without waste of materials or damage to apparatus, circuits, the surrounding environment or services and using sustainable energy principles
3 Complete maintenance work on battery banks and report	3.1	OHS work completion risk control measures and procedures are followed
	3.2	Work site is cleaned and made safe in accordance with established procedures
	3.3	Final checks are made so that the installed apparatus conforms to requirements
	3.4	‘As-installed’ apparatus and associated equipment is documented and appropriate person(s) notified in accordance with established procedures

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and assembling and connecting remote area power supplies (RAPS).

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK111A Remote area power supplies ELV installations requirements

Evidence shall show an understanding of requirements for Remote area power supplies ELV installations to an extent indicated by the following aspects:

Requirements for installation of wiring and equipment

Compliant methods for providing protection

Requirements for installation planning and selection of equipment

Testing and verification requirements

Documentation encompassing:

- results of tests conducted that comply with requirements and ensure the remote area power supplies ELV installation is safe, including any formal documents of the results of testing required by authorities.
- documents of periodic inspection and testing of remote area power supplies ELV wiring and equipment including any tagging, in accordance with requirements.

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous substance/material present a challenge for those determining competence. Sources of evidence need to be ‘rich’ in nature to minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its ‘richness’. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate **9.2)**

© Commonwealth of Australia, 2025 Powering Skills Organisation

competency in this unit

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit must be considered holistically. Each element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence must also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this must incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Assemble and connect remote area power supplies (RAPS) as described in 8) and including:

A Reading and interpreting drawings related to and apparatus locations and circuit connections.

B Placing and securing apparatus accurately

C Maintaining fire integrity

D Connecting apparatus and associated equipment to comply with requirements

E Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic

© Commonwealth of Australia, 2025 Powering Skills Organisation

assessment with the above listed items

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence must be clearly identified

Context of and specific resources for assessment **9.3)**

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to assembling and connecting remote area power supplies (RAPS).

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires

© Commonwealth of Australia, 2025 Powering Skills Organisation

assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEK104A	Conduct periodic maintenance of remote area power supply generator sets
UEENEEK105A	Conduct periodic maintenance of remote area power supply photo voltaic arrays
UEENEEK107A	Conduct checks in the demand side use of remote area power supplies (RAPS)

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit must be demonstrated in relation to least two different RAPS systems in which the battery bank is charged from a generator set and a photo voltaic array and at least one similar RAPS system where the battery bank is charged form a wind generator.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Prepare to monitor energy usage and provide basic solutions for energy reduction	1.1	Monitoring activities are planned and prepared for to ensure OHS policies and procedures are followed with the work appropriately sequenced in accordance with requirements
		1.2	Appropriate personnel are consulted to ensure the work is coordinated effectively with others involved
		1.3	Materials are obtained and checked in accordance with established procedures and to comply with requirements
		1.4	Location in which monitoring activities are to be undertaken is determined from job requirements
		1.5	Materials necessary to complete the work are obtained in accordance with established procedures and checked against job requirements
		1.6	Materials needed to carry out the monitoring are obtained in accordance with established procedures
2	Undertake monitoring of energy usage and provide basic solutions for energy reduction	2.1	OHS policies and procedures for undertaking monitoring activities are followed
		2.2	Monitoring activities are undertaken in accordance with requirements, without damage or distortion to the surrounding environment or services
		2.3	Unplanned events or conditions are responded to in accordance with established procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT		PERFORMANCE CRITERIA	
		2.4	Approval is obtained in accordance with established procedures from appropriate personnel before any contingencies are implemented
		2.5	Ongoing checks of the quality of the work are carried out in accordance with established procedures
3	Complete monitoring activities and provide and provide reports where necessary	3.1	Documentation/reports are completed to ensure administrative requirements are met
		3.2	Work completion is notified in accordance with established procedures

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and providing basic sustainable energy solutions for energy reduction in domestic premises.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK112A **Concepts of renewable energy**

Evidence shall show an understanding of concepts of renewable energy to an extent indicated by the following aspects:

T1 Non-technical issues encompassing:

- current economic, social, environmental and political issues, impact on a renewable energy technology

T2 Energy services/demand encompassing:

- terminology
- energy, power, temperature, symbols, units

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- energy conversion and efficiency
- domestic dwelling: energy services and energy demand of individual appliance,
- energy efficient appliances
- primary energy and end use energy
- embodied energy

T3 Solar radiation resource encompassing:

- terminology
- units, symbols, conversions
- sun path diagrams
- solar contour maps
- solar window

T4 Solar thermal systems encompassing:

- terminology
- components
- applications
- types of hot water systems

T5 Photovoltaic arrays encompassing:

- terminology
- current, voltage and power
- modules: types, efficiency, applications
- IV curve
- irradiance and temperature effects
- array configurations

T6 Wind energy resource and technology encompassing:

- terminology, units, symbols
- wind speed, direction, turbulence, wind power,
- vertical wind speed profile (wind shear)
- local terrain roughness
- isovent maps
- measuring instruments
- Wind Energy Conversion Systems (WECS)
- terminology
- characteristics
- applications

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T7 Micro-hydro resource and technology encompassing:

- terminology, units, symbols
- flow rate, head, assessment
- turbine types and applications

T8 Stand-alone power system configuration encompassing:

- basic configuration series systems
- components: functions, efficiencies; regulators, inverters, battery chargers, generators

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Plan and prepare to promote sustainable energy practice	1.1	Activities are planned and prepared to ensure OHS policies and procedures are followed with the work appropriately sequenced in accordance with requirements
		1.2	Appropriate personnel are consulted to ensure the work is coordinated effectively with others involved
		1.3	Materials are obtained and checked in accordance with established procedures and to comply with requirements
		1.4	Location in which activities are to be undertaken is determined from requirements
		1.5	Materials necessary to complete the work are obtained in accordance with established procedures and checked against job requirements
2	Promote sustainable energy practice	2.1	OHS policies and procedures for undertaking administrative functions are followed
		2.2	Activities are undertaken in accordance with requirements without damage or distortion to the surrounding environment or services
		2.3	Unplanned events or conditions are responded to in accordance with established procedures
		2.4	Approval is obtained in accordance with established procedures from appropriate personnel before any contingencies are implemented

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	2.5	Ongoing checks of the quality of the work are undertaken in accordance with established procedures
3 Complete the promotion of sustainable energy	3.1	Documentation/reports are completed to ensure detailed promotional activities requirements are met
	3.2	Completion is notified in accordance with established procedure

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and promoting sustainable energy practices in the community.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK114A **Greenhouse reduction strategies**

Evidence shall show an understanding of greenhouse gas reduction strategies to an extent indicated by the following aspects:

T1 Greenhouse gas emissions profile encompassing:

- goals and principles of the National Greenhouse Strategy
- what a greenhouse gas inventory is, why it is required, and the sectors to which it applies
- uses to which the National Greenhouse Gas Inventory can be applied.

T2 Understanding and communicating climate change and its impacts encompassing:

- the possible impact of climate change in Australia.
- techniques for improving the understanding of climate change
- techniques for communicating to and educating the general public on greenhouse gas induced climate change.

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T3 Partnerships for greenhouse action encompassing:

- actions achievable by each level of government to implement the NGS.
- methods by which the community activity can be engaged in the reduction of greenhouse gas emissions.
- initiatives that can be undertaken by the private sector to reduce greenhouse gas emissions.
- advantages of international partnerships.
- emissions trading system.

T4 Efficient and sustainable energy use and supply encompassing:

- techniques for reducing the greenhouse intensity of energy supply.
- types of renewable energy sources suitable for use in Australia.
- methods and technique for improving end-use efficiency.

T5 Efficient transport and sustainable urban planning encompassing:

- how integrating land use and transport planning can assist the greenhouse problem.
- how each of the following can be used to mitigate greenhouse gas; travel demand and traffic management strategies; encouraging greater use of public transport, walking and cycling; freight and logistics systems; improving vehicle fuel efficiency and fuel technologies;

T6 Greenhouse sinks and sustainable land management encompassing:

- how enhancing greenhouse sinks and encouraging sustainable forestry and vegetation management can complement the AGS.
- how greenhouse gas emissions are obtained from agricultural production and describe techniques to mitigate the emissions.

T7 Models of greenhouse best practice in industrial processes and waste management encompassing:

- types and methods of reducing greenhouse gas emissions from industry.
- methods of reducing methane emissions from waste treatment and disposal.

REQUIRED SKILLS AND KNOWLEDGE

T8 Adaptation to climate change encompassing:

- salient points in each of the key sectors that require analysis and the strategies required in the need for adaptation to climate change

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous substance/material present a challenge for those determining

© Commonwealth of Australia, 2025 Powering Skills Organisation

competence. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit must be considered holistically. Each element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence must also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this must incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination

© Commonwealth of Australia, 2025 Powering Skills Organisation

legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Promote sustainable energy practices in the community as described in 8) and including:

A Applying sustainable energy practice in the community

B Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence must be clearly identified

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to promoting sustainable energy practices in

© Commonwealth of Australia, 2025 Powering Skills Organisation

the community.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units **9.5)**

There are no concurrent assessment recommendations for this unit.

Range Statement

RANGE STATEMENT

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit must be demonstrated in relation to promoting sustainable energy practice in the community in any of the following disciplines:

- Appliances
- Business equipment
- Computers
- Data Communications
- Electrical
- Electrical Machines
- Electronics
- Fire protection
- Instrumentation
- Refrigeration and Air Conditioning
- Renewable/sustainable energy
- Security technology

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers basic maintenance of power generation facilities in remote areas It encompasses working safely, following maintenance schedules to inspect, repair, replace and adjustment equipment, maintaining a clean and efficient generation facility and completing the necessary reporting.

Application of the Unit

Application of the Unit **2)**

This unit is intended primarily for indigenous persons seeking qualifications in remote area utilities facilities servicing. The unit may also be applied to work entry qualifications in renewable energy service work in general and be used in school-based vocational programs.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace. However,

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

practice in this unit is subject to regulations directly related to occupational health and safety and contracts of training such as new apprenticeships.

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting, risk safety measures etc

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

Where pre-requisite pathways have been identified. All competencies in the Common Unit Group must be have been completed plus all the competencies in one (1) of the identified Pathway Unit Group(s):

Electrotechnology

Remote Area

Common Unit Group

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

Prerequisite Unit(s) **4)**

UEENEEE102A	Fabricate, assemble and dismantle utilities industry components
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications
UEENEEK101A	Maintain safety and tidiness of remote area power supply systems
UEENEEK102A	Work safely with remote area power supply systems
UEENEEK104A	Conduct periodic maintenance of remote area power supply generator sets

Electrotechnology Pathway Group

UEENEEE104A	Solve problems in d.c. Circuits

Remote Area Pathway Group

UEENEEE131A	Solve problems in ELV circuits for non electrical workers

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to maintain and repair remote area power generation facilities	1.1 OHS procedures for a remote area power station facility are identified, obtained and understood through established routines and procedures
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed
	1.3 Safety hazards which have not previously been identified are reported and advice on risk control measures is sought from the work supervisor
	1.4 The nature and location of remote area power station facility is obtained from documentation or from work supervisor to establish the scope of work to be undertaken
	1.5 Advice is sought from the work supervisor to ensure the work is coordinated effectively with fellow workers and the local community
	1.6 Sources of materials that may be required for the work are identified and accessed in accordance with established routines and procedures
	1.7 Tools, equipment and testing devices needed to carry out the work are obtained and checked for

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		correct operation and safety.
2 Maintain and repair remote area power generation facilities	2.1	Established OHS risk control measures and procedures for carrying out the work are followed
	2.2	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures
	2.2	Inspection, repairs, replacements and/or adjustments are carried out on items listed in the maintenance schedule and in accordance with established procedures.
	2.3	Fuel, coolant, oil and other fluid spills are cleaned and area made safe in accordance with established procedures.
	2.4	Batteries are serviced and/or replaced as specified in the maintenance schedule and in accordance with established procedures.
	2.5	Consumables are removed and disposed of following environmentally safe procedures.
	2.6	Procedures are followed for referring non-routine events to immediate supervisor for directions
	2.7	Routine quality checks are carried out in accordance with work instructions
3 Report maintenance and repair of remote area power generation facilities	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Procedures are followed for referring maintenance issues beyond the scope of prescribed work to persons of higher authority.
	3.3	Work carried out is reported to the work supervisor through the established maintenance reporting procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and maintaining and repairing facilities associated with remote area essential service operations.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK116A Remote area essential services power plant

Evidence shall show an understanding of remote area essential services power plant to an extend indicated by the following aspects:

Minor service and maintenance procedures of diesel powered generation equipment in accordance with a prepared schedule encompassing:

- Types and grades of inspections, repairs, replacement and/or adjustments under a maintenance schedule:
  - Replacement items/materials include engine oil, oil filters, fuel filters, engine coolant system filters, air cleaners and fan belts;
  - Inspection and repair items include leakages from fuel system, coolant system and lubricating oil system.
- Cleaning of fluid spills.
- Environmentally safe procedures for removal and disposal of consumables.

Servicing batteries and battery packs in a community power station in accordance with the prepared maintenance schedule encompassing:

- Hazards associated with batteries.
- Types of batteries and their application in a community power station (Starting battery set, switchboard (nicad) batteries)
- Battery maintenance techniques

Schedule regular servicing and maintenance encompassing:

- Engine oil and filter changes;
- Fuel filters;
- Coolant filters

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Water trap devices
- Drive belt (condition/adjustment);
- Valve adjustments (if applicable);
- Major and minor mechanical servicing by outside agents;
- Air cleaner (both dry paper and oil bath types)

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous

substance/material present a challenge for those determining competence. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit must be considered holistically. Each element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence must also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this must incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement.
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Maintain and repair remote area power generation facilities as described in 8) and including:

A Understanding the location and nature of the work required

B Correctly inspecting, repairing, replacing and adjusting items listed in the maintenance schedule

C Cleaning fluid spills appropriately.

D Removing and disposing of consumable following environmentally safe procedures.

E Documenting work activities accurately

F Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence must be clearly identified

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment

ELEMENT	PERFORMANCE CRITERIA	
	2.8	Routine quality checks are carried out in accordance with work instructions
3 Complete maintenance and repair work report	3.1	OHS work completion risk control measures and procedures are followed
	3.2	Work site is cleaned and made safe in accordance with routine procedures
	3.3	Procedures are followed for referring maintenance issues beyond the scope of prescribed work to persons of higher authority
	3.4	Work carried out is reported to the work supervisor through the established maintenance reporting procedures

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and maintaining and repairing facilities associated with remote area essential service operations.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK117A Remote area essential services facilities

Evidence shall show an understanding of remote area essential services facilities to an extent indicated by the following aspects:

T1 Window repair and maintenance encompassing:

- Emergency repairs
- Louvre type
- Fixed pane type
- Shutters
- Safety awareness

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T2 Repair and maintenance to fences and gates encompassing:

- Emergency repairs
- Locks and catches
- Security fencing
- Fence maintenance
- Gates
- Safety awareness

T3 Maintenance painting encompassing:

- Preparation of surfaces
- Block work
- Concrete
- Timber
- Steel
- Paint selection
- Brush and roller selection
- Paint application
- Clean up process
- Paint and accessories storage
- Safety awareness

T4 Essential services facilities lighting encompassing:

- Incandescent lamps
- Compact fluorescent lamps
- Fluorescent tubes
- Fluorescent light starters
- Diffusion devices
- Safety awareness
- Disposal of faulty lamps

T5 Essential services facilities safety and security and emergency checks encompassing:

- Broken windows
- Faulty lighting
- Damaged gates
- Logging the inspections
- Notification of the situation
- Safety awareness

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

T6 Telephone encompassing:

- Answer calls promptly and clearly.
- Using designated business protocol procedure
- Making and receiving telephone calls in a workplace context
- Obtain accurate telephone numbers from an appropriate source.
- Establish contact using designated business protocol procedures.
- Convey purpose all call clearly and concisely.

T7 Mathematical operations encompassing:

- Whole numbers.
- Fractions
- Decimals
- Percentages
- Ratios
- Proportions

T8 Electrical encompassing:

- Identification and basic function of electrical components used
- for generating and distributing.
- Electricity safety procedures when working with electricity.
- Identification of faulty electrical components.
- Reporting of faulty electrical components.

T9 Fire fighting equipment encompassing:

- Fire extinguishers and signage
- Types of fire extinguishers
- Contents and colour
- Correct identification
- Use of fire extinguishers
- Use of water hose and reel
- Safety awareness

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit must be considered holistically. Each element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence must also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this must incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Maintain and repair facilities associated with remote area essential service operations as described in 8) and including:

A	Understanding the location and nature of the work required
B	Identifying deterioration and damage to facilities correctly

© Commonwealth of Australia, 2025 Powering Skills Organisation

C	Carrying out maintenance and repairs effectively
D	Identifying maintenance issues beyond the scope of prescribed work and notifying appropriate persons
E	Documenting work activities accurately
F	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items Note: Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence must be clearly identified

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to maintaining and repairing facilities associated with remote area essential service operations.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units **9.5)**

There are no concurrent assessment recommendations for this unit.

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers basic maintenance power station compound of remote area infrastructure facilities, monitoring power station performance and developing a basic maintenance schedule. It encompasses working safely, to maintenance standards and following maintenance routines, identifying deterioration and damage to facilities using routine procedures, reading and recording performance information from instruments/meters and completing the necessary reporting.

Application of the Unit

Application of the Unit **2)**

This unit is intended primarily for indigenous persons seeking qualifications in remote area utilities facilities servicing. The unit may also be applied to work entry qualifications in renewable energy service work in general and be used in school-based vocational programs.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace. However, practice in this unit is subject to regulations directly

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

related to occupational health and safety and contracts of training such as new apprenticeships.

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting, risk safety measures etc

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health Safety regulations, codes and practices in the workplace
UEENEEK102A	Work safely with remote area power supply systems

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

© Commonwealth of Australia, 2025 Powering Skills Organisation

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to maintain and power station compound and monitor performance.	1.1 OHS procedures for a remote area power station facility is identified, obtained and understood through established routines and procedures
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed
	1.3 Safety hazards which have not previously been identified are reported and advice on risk control measures is sought from the work supervisor
	1.4 The nature and location of remote area power station facility is obtained from documentation or from work supervisor to establish the scope of work to be undertaken

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
	1.5	Advice is sought from the work supervisor to ensure the work is coordinated effectively with fellow workers and the local community
	1.6	Sources of materials that may be required for the work are identified and accessed in accordance with established routines and procedures
	1.7	Tools, equipment and testing devices needed to carry out the work are obtained and checked for correct operation and safety.
	1.8	Established procedures are followed to repair or replace defective and unsafe tools and service equipment.
2 Maintain power station compound and monitor performance	2.1	Established OHS risk control measures and procedures for carrying out the work are followed
	2.2	Circuits/machines/plant are checked as being isolated where necessary in strict accordance OHS requirements and procedures
	2.2	Established procedures are followed to clean and tidy power station building, generating equipment and compound to maintain safe and efficient plant area.
	2.3	Inspection and reporting is conducted on suitability, location and legibility of safety signage.
	2.4	Inspection and reporting is conducted on location, suitability and condition of fighting equipment
	2.5	Performance, status and fuel and oil use of generation equipment is monitored and logged from information displayed instruments, meters and measuring devices.
	2.7	Procedures are followed for referring non-routine events to immediate supervisor for directions
	2.8	Routine quality checks are carried out in

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		accordance with work instructions
3 Develop basic maintenance schedule and complete work report	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Maintenance schedule is developed from logged information on power station performance, status and condition of compound.
	3.3	Procedures are followed for referring maintenance issues beyond the scope of prescribed work to persons of higher authority.
	3.4	Work carried out is reported to the work supervisor through the established maintenance reporting procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and maintaining and repairing facilities associated with remote area essential service operations.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK118A Power station and compound maintenance

Evidence shall show an understanding of RAPS compound maintenance and meter reading to an extent indicated by the following aspects:

Maintaining clean, tidy and safe condition of the power station building and generating equipment encompassing:

- Removal of generating plant oil, coolant and fuel leaks.
- Removal fluid spills from plant room floor areas.
- Cleaning of power house ventilation systems
- Removal of insects and fauna from plant area.
- Environmentally safe disposal of used consumables and

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

rubbish.

- Repositioning empted rubbish bins.
- Correct storage of plant spares.

Maintaining a clean, tidy and safe working environment of power station compound encompassing:

- Repairing and securing compound perimeter fencing and gates.
- Removal and environmentally safe disposal of flora from the fence line and plant room perimeter.
- Removal and environmentally safe disposal compound rubbish
- Cutting and watering the compound grassed area.
- Safe arrangements for storage of fuel drums and other flammable liquids.
- Maintaining water reticulation equipment.

Inspecting, classifying and repairing the power station tools and equipment encompassing:

- Inspecting and reporting hand tools and service equipment for serviceability.
- Equipment repair procedures.
- Cleaning and storage of tools and equipment.

Inspecting and reporting on the safety signage displayed in the power station and on the perimeter fence encompassing:

- Types and location of safety signs relevant to a community power station and compound.
- Reporting on the conditions and suitability of the signs.

Locating, inspecting and reporting on the fixed and portable fire fighting equipment contained in and around the power station encompassing:

- Types of fire fighting equipment suitable for a power station.
- Typical locations of power station fire fighting equipment.
- Inspecting and reporting suitability and condition of fire fighting equipment.

Instruments/meters showing performance/status of community power stations encompassing:

- Types of information displayed on the instrument panel and switchboards (engine oil pressure, coolant temperatures fuel pressure/flow, amperes, voltage, kilowatt, kilowatt hours,

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

frequency Hertz, and engine running hours).

- Instrument/meter reading and recording techniques.
- Dip stick measurement measure and recording methods of bulk fuel and engine oil.

Developing maintenance schedules from logged information of community power station performance encompassing:

- Logged information is that listed in T1 above.
- Maintenance schedules includes timely ordering of fuel, coolant and engine oil, engine oil changes, engine oil filter changes, fan belt condition and adjustment, air cleaner element service, minor tune up requirements, valve adjustments and minor and major overhaul work.

Instrument/meter reading and maintenance scheduling records.

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.1)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and

© Commonwealth of Australia, 2025 Powering Skills Organisation

regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous substance/material present a challenge for those determining competence. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit must be considered holistically. Each element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence must also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this must incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Apply sustainable energy principles and practices as specified in the performance criteria and range statement.
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Maintain and monitor remote area essential service operations as described in 8) and including:

A	Understanding the location and nature of the work required
B	Following established procedures for repairing or replacing defectives tools and service equipment
C	Cleaning and tidying power station building, generating equipment and compound effectively.
D	Correctly inspecting and reporting suitability, location and legibility of safety signage.
E	Correctly inspecting and reporting location, suitability and condition of fighting equipment.
F	Accurately monitoring and logging performance, status and fuel and oil use of generation equipment.
G	Developing an appropriate basic maintenance schedule from logged information
H	Documenting work activities accurately
I	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items Note: Successful completion of relevant vendor training may be used to contribute to evidence on which

© Commonwealth of Australia, 2025 Powering Skills Organisation

competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence must be clearly identified

Context of and specific resources for assessment **9.3)**

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to maintaining and repairing facilities associated with remote area essential service operations.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Concurrent assessment and relationship with other units **9.5)**

There are no concurrent assessment recommendations for this unit.

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit must be demonstrated in relation to least two different remote area essential service operations.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Not applicable.

Competency Field

Competency Field **11)**

Renewable and Sustainable Energy

UEENEEK123A Carry out basic repairs to renewable energy apparatus

Modification History

Not applicable.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit deals with the replacement of electrical and non-electrical components of renewable energy apparatus. It encompasses safe working practices, following written and oral instructions and procedures, basic testing techniques, disconnecting and reconnecting electrical/electronic components, dismantling and assembling apparatus and reporting repair activities.

Application of the Unit

Application of the Unit **2)**

This unit is intended for competency development entry-level employment-based programs incorporated in approved contracts of training.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a license to practice in the workplace provided equipment is not connected to installation wiring at voltage above 50 V a.c. or 120 V d.c. However, practice in this unit is subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting, risk safety measures etc.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE104A	Solve problems in d.c. circuits

AND

UEENEEE108A	Lay wiring/cabling and terminate accessories for extra-low voltage (ELV) circuits

OR

UEENEEG106A	Terminate cables, cords and accessories for low voltage circuits

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve competency in this unit if they have reading, writing and numeracy skills

© Commonwealth of Australia, 2025 Powering Skills Organisation

indicated by the following scales. Description of each scale is given in Volume 2, Part 3 'Literacy and Numeracy'

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA
1 Prepare to repair renewable energy apparatus.	1.1 OHS procedures for a given work area are identified, obtained and understood through established routines and procedures
	1.2 Established OHS risk control measures and procedures in preparation for the work are followed
	1.3 The nature of the repair is obtained from documentation or from work supervisor to establish the scope of work to be undertaken
	1.4 Advice is sought from the work supervisor to ensure the work is coordinated effectively with

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		others
	1.5	Sources of materials that may be required for the work are identified and accessed in accordance with established routines and procedures
	1.6	Tools, apparatus and testing devices needed to carry out the work are obtained and checked for correct operation and safety
2 Repair renewable energy apparatus.	2.1	Established OHS risk control measures and procedures for carrying out the work are followed
	2.2	The need to test or measure live is determined in strict accordance with OHS requirements and when necessary conducted within established safety procedures
	2.3	Circuits/apparatus are checked as being isolated where necessary in strict accordance OHS requirements and procedures
	2.4	Apparatus is dismantled in accordance with manufacturer's guide and supervisor's instructions
	2.5	Component parts are tagged during the dismantling to help ensure correct and efficient reassembly and stored to protect them against loss or damage
	2.6	Repairs are affected efficiently without damage to other components, apparatus or circuits.
	2.7	Apparatus is assembled in an appropriate sequence with all parts placed, secured and connected in accordance with manufacturer guide or industry practice
	2.8	Procedures are followed for referring non-routine events to immediate supervisor for directions
	2.9	Repairs are carried out efficiently without waste of materials or damage to apparatus and the surrounding environment or services and using

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		sustainable energy practices
3 Complete and report repair work activities.	3.1	OHS work completion risk control measures and procedures are followed
	3.2	Repaired apparatus is prepared for testing by an appropriate person
	3.3	Work area is cleaned and made safe in accordance with established procedures
	3.4	Work supervisor is notified of the completion of the repair work in accordance with established procedures

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence must show that knowledge has been acquired of safe working practices and carrying out basic repairs to renewable energy apparatus by replacement of components.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK123A Introduction to renewable energy technologies

Evidence shall show an understanding of renewable energy principles and technologies to the extent indicated by the following aspects:

T1 Major non-technical issues encompassing:

- impact of economic, social, environmental and political issues on the use of renewable energy technologies.
- how each of the non-technical issues impact on the application of a selected renewable energy technology.

T2 Energy services and demand encompassing:

- definition of the terms: energy, power, energy efficiency, end use energy, primary energy, embodied energy.
- calculation relating to energy, power and time with the

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

appropriate number and time with the appropriate number of significant figures.

- units and symbols for energy, power, time and temperature using standard SI units and prefixes.
- conversion of energy and power quantities from one unit to another using conversion tables
- the two laws that apply to any energy conversion process.
- efficiency of a simple energy conversion process.
- energy services required by a domestic dwelling.
- power and energy consumption of individual appliances and systems using appropriate meters or other methods.
- calculation of the end use and primary energy required for these energy services.
- selection of the most appropriate energy source for each of these services.
- justification in terms of environmental, economic, social and political constraints.
- selection of appropriate energy efficient appliances and technologies.

T3 The solar resource encompassing:

- definition of the terms: irradiation, latitude, solar constant, direct and diffuse radiation, azimuth and altitude angles, irradiance, solar window, tilt angle, solstice, equinox.
- units and symbol for irradiation and irradiance and the conversion of one unit to another using conversion tables.
- measurement of solar irradiance with a solarimeter.
- solar radiation data tables and contour maps.
- position of the sun for a given date, time and latitude using a sun path diagram.
- times when an obstacle will shade a given collector.
- how radiation varies throughout the year on the surface of a collector which is either fixed, single-axis tracking or double-axis tracking.
- appropriate tilt angles for fixed and seasonally-adjustable collectors at a given latitude and given application
- calculation of the effect of single-axis tracking and double-axis tracking on collected radiation using radiation data tables.

T4 Solar thermal systems encompassing:

- definition of the terms: conduction, convection, radiation, collector heat loss co-efficient, conductivity, specific hear,

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

solar fraction.

- components for a solar thermal system including collector, storage, reticulation and control.
- solar collector types suitable for low, medium and high temperature applications.
- different types of domestic solar hot water (SWH) systems.
- how the components of thermosiphon and pumped storage systems operate.
- heat loss mechanisms in collectors.
- stratification in storage tanks.
- backup energy systems.
- control and protection strategies.
- solar fraction of a domestic SHW system with the use of table or nomograms.

T5 Energy efficient building design encompassing:

- definition of the terms: thermal comfort, passive system, active system, aspect of the site, orientation of the building, thermal mass.
- the climate factors which affect building design.
- relationship between thermal comfort and climate.
- relationship between the seasonal variation of the sun's path and the heat gain of the building elements (roof, walls, windows, floor).
- effect of the thermal conductivity of building materials on heat flows to and from the building
- use of thermal mass in reducing temperature variations within the building.
- use of ventilation.
- thermal performance of a dwelling using both indoor and outdoor hourly temperature measurements over the period of at least one day.
- effect of insulation, glazing, orientation, shading devices, thermal mass and ventilation on the thermal performance of a building.
- an active solar system which could be used in a dwelling to complement passive design features in extreme climates.
- aspects of an existing dwelling that contribute to or detract from thermal performance.

T6 Photovoltaic arrays encompassing:

- definition of the terms: photovoltaic (PV) cell, module, series,

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

parallel, array, maximum power point (MPP), nominal operating cell temperature (NOCT), short circuit current (ISC), open Circuit voltage (VOC), I-V curve, current at maximum power point (IMP), voltage at maximum power point (VMP).

- calculations relating to voltage, current and power with the appropriate number of significant figures and using standard SI units and prefixes.
- types of commercially available PV modules, their efficiency and typical applications.
- I-V curve for a typical PV module and label the approximate position of MPP and values of ISC, VOC, IMP and VMP.
- effect of irradiance and temperature on ISC, VOC, IMP and VMP.
- function of blocking and bypass diodes.
- current and voltage of a single module to produce the I-V characteristic curve.
- major specification criteria for a PV module.
- size and configuration of a PV array for a given load and system voltage using tables or nomograms.

T7 Wind energy resources encompassing:

- definition of the terms: kinetic energy, specific wind power, vertical wind speed profile, surface roughness, temperature inversion layer, cut in (vC), rated (vR) and furling (vF) wind speeds, rated power (PR), power co-efficient (cP), output co-efficient (cO), tip speed ratio.
- units and symbols for wind speed, specific wind power and air density.
- large scale wind patterns over the Australian continent, their causes and the effect of local terrain on wind speed, direction and turbulence.
- specific wind power for given wind speeds.
- wind speed at different heights above ground level.
- the mean wind speed based on wind speed frequency distribution data in the form of a histogram.
- suitable minimum tower height for a Wind.
- energy conversion System (WECS) sited downwind from an obstacle.
- isovent maps.
- types of wind-measuring instruments and the minimum requirements for assessing wind energy at a given site.
- measurement of wind speed and direction

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- characteristics of horizontal axis and vertical axis, upwind and downwind, lift and drag propelled wind turbines.
- power vs. wind speed curve for a typical WECS showing vC, vR, vF, and PR.
- major specification criteria for a WECS.
- sizing a WECS for a given load, efficiency and annual mean wind speed using tables or a nomogram.

T8 Micro-hydro system basis encompassing:

- definition of the terms: flow rate, gross or static head, potential energy, net or dynamic head, hydraulic efficiency, MHS efficiency, equivalent pipe length, reaction turbine, impulse turbine
- units and symbols for: flow rate, head, gravitational constant
- methods each assessing flow rate and head.
- measurement of stream flow rate and head.
- assessment from contour maps.
- different MHS in terms of their physical and operating characteristics.
- major specification criteria for an MHS for electricity generation.
- suitable type and size of MHS for a given load, efficiency, available flow rate and net head using tables or a nomogram.

T9 Energy storage encompassing:

- methods of energy storage.
- energy density of the energy storage methods above by mass and volume.
- define the following terms in relation to batteries: nominal voltage, cell, primary and secondary cells, battery, charge and discharge rate, amp hour capacity, watt hour capacity, state of charge (SOC), depth of discharge (DOD), specific gravity (SG), watt hour and amp hour efficiency, cycle life.
- major features of common types of batteries suitable for stand-alone power systems.
- state of charge of a lead-acid battery through measurement of specific gravity or battery voltage using safe working practices.

T10 Stand alone power system basis encompassing:

- d.c. sub-system efficiency.
- block diagram of a typical SPS
- function of each SPS system component

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- typical efficiencies of each component.
- major characteristics of different types of commercially available regulators, inverters and battery chargers.

T11 Biomass encompassing:

- definition of the terms: biogas, producer gas, biofuels, feedstock, gross and net calorific values.
- biofuels and their specific energy contents
- method of production of one of these five biofuels including: source of raw material/feedstock, conversion process, yield
- applications for each of the biofuels.
- assessment of the biomass resource required to meet a particular energy service e.g. cooking, hot water, space heat, transport, process heat, electricity.
- social, political and economic impact of large scale use of selected biomass resources.

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit and must be read in conjunction with the performance criteria and the range statement of the unit and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this unit. It must be used in conjunction with all parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the

© Commonwealth of Australia, 2025 Powering Skills Organisation

workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous substance/material present a challenge for those determining competence. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

Before the critical aspects of evidence are considered all prerequisites must be met.

Evidence for competence in this unit must be considered holistically. Each element and associated performance criteria must be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence must also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this must incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range

© Commonwealth of Australia, 2025 Powering Skills Organisation

statement

- Apply sustainable energy principles and practices as specified in the performance criteria and range statement
- Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
- Demonstrate an appropriate level of skills enabling employment
- Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures

- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Carry out basic repairs to renewable energy apparatus by replacement of components as described in 8) and including:

A	Following manufactures service instructions for access to components
B	Removing at least three different types of components specified in the work instructions
C	Replacing components to manufacturer requirements.
D	Reassembling the apparatus correctly.
E	Testing apparatus operation
F	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence must be clearly identified

© Commonwealth of Australia, 2025 Powering Skills Organisation

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to carrying out basic repairs to renewable energy apparatus by replacement of components.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 ‘Assessment Guidelines’.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

© Commonwealth of Australia, 2025 Powering Skills Organisation

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with unit:

UEENEEE102A	Fabricate, assemble and dismantle utilities industry components
UEENEEE104A	Solve problems in d.c. circuits
UEENEEE107A	Use drawings, diagrams, schedules, standards, codes and specifications

The critical aspects of occupational health and safety covered in unit UEENEEE101A and other discipline specific occupational health and safety units shall be incorporated in relation to this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit must be demonstrated in relation to carrying out basic repairs renewable energy apparatus limited to replacement or repair of components in which the fault has been previously established. This must include at least two different renewable energy apparatus in which three different types of components are faulty one of which is mechanical.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This competency standard unit requires the worker to undertake methods of work practice that minimises energy and material usage and to seek energy reduction strategies in the energy sector workplace. The unit seeks to minimise negative impacts on the environment.

Application of the Unit

Application of the Unit **2)**

This competency standards unit shall apply to persons entering work in energy sector and may be used in school based vocational programs.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit do not require a licence to practice in the work place. However practice in this unit is subject to regulations directly related to occupational health and safe and contracts of training such as new apprenticeships and the like.

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control, lifting equipment and the like. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus, site rehabilitation and the like.

2. Compliance may be required in various jurisdictions relating to currency in first aid, confined space, lifting, risk safety measure and the like

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

There are no prerequisite competencies for this unit

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve this unit if they have reading, writing and maths skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 “Literacy and Numeracy”

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Plan and prepare to apply sustainable work practice	1.1	Activities are planned and prepared for to ensure OHS policies and procedures are followed with the work appropriately sequenced in accordance with requirements
		1.2	Appropriate personnel are consulted to ensure the work is co-ordinated effectively with others involved
		1.3	Materials are obtained and checked in accordance with established procedures and to comply with requirements
		1.4	Location in which activities are to be undertaken is determined from requirements
		1.5	Materials necessary to complete the work are obtained in accordance with established procedures and checked against job requirements
		1.6	Workplace environmental risks and resource efficiency issues are identified
2	Apply sustainable work practice	2.1	OHS policies and procedures for undertaking administrative functions are followed
		2.2	Activities are undertaken in accordance with requirements to implement techniques which produce energy reduction directly or indirectly
		2.3	Unplanned events or conditions are responded to in accordance with established procedures
		2.4	Approval is obtained in accordance with established procedures from appropriate personnel before any contingencies are

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		implemented
	2.5	On-going checks of the quality of the work are undertaken in accordance with established procedures
	2.6	Work is carried out efficiently without unnecessary waste of materials or damage to the surrounding environment, while using sustainable work practices which minimise wastage of energy and materials either directly or indirectly
3 Complete the application of sustainable work practice	3.1	Documentation/reports are completed to ensure detailed promotional activities requirements are met
	3.2	Suggestions are made for improvements to workplace practices to minimise energy and materials wastage
	3.3	Completion is notified in accordance with established procedures

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and applying environmentally and sustainable work practices in the energy sector.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK142A Environmentally and sustainable work practice

Evidence shall show an understanding of environmentally and sustainable work practices to an extent indicated by the following aspects:

T1 Sustainable work practices encompassing:

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Notion of sustainable work practice
- Effects of neglecting sustainable work practice
- The greenhouse effect - causes, consequences.
- International and national greenhouse imperatives.
- The role of regulators and similar bodies
- Legislative requirements
- Economic benefits of sustainable initiatives.

T2 Techniques for reducing carbon produced energy and hence greenhouse gases encompassing:

- domestic, commercial and industrial strategies
- trade related technologies and methods
- energy efficient retrofits (overview).
- renewable energy technologies (overview)

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit of competency and must be read in conjunction with the performance criteria and the range statement of the unit of competency and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this Competency Standard Unit and shall be used in conjunction with all components parts of this unit and, performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitude competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the Industry's preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. It is recognised that, in some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accord

© Commonwealth of Australia, 2025 Powering Skills Organisation

with Industry and, Regulatory policy in this regard.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety nature of working with electricity, electrical equipment, gas or any other hazardous substance/material carries risk in deeming a person competent. Hence, sources of evidence need to be 'rich' in nature so as to minimise error in judgment.

Activities associated with normal every day work have a bearing on the decision as to how much and how detailed the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practiced. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

© Commonwealth of Australia, 2025 Powering Skills Organisation

Before the critical aspects of evidence are considered all prerequisites shall be met.

The evidence on which competency in this unit is based shall be considered holistically for each element on at least two occasions comprising:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range; and
  - Apply sustainable work practice principles and practices as specified in the performance criteria and range; and
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements. and
  - Demonstrate an appropriate level of skills enabling employment; and
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures; and
- Demonstrated performance across a representative range of contexts from the prescribed items below:
  - Participate in environmentally sustainable work practices as listed in the Range statement' and including:

A Apply sustainable work practice in daily work activities

B Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified

© Commonwealth of Australia, 2025 Powering Skills Organisation

Context of and specific resources for assessment **9.3)**

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this competency standard unit.

Resources required to assess this unit are listed above in Context of assessment', which should also be used in the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment it must ensure that the conditions for assessment are authentic and as far as possible reproduce and replicate the workplace and is consistent with the approved industry simulation policy.

In addition to the resources listed above in Context of and specific resources for assessment, evidence should show demonstrated competency in participating in environmentally sustainable work practices.

Method of assessment **9.4)**

This competency standard unit shall be assessed by methods given in Volume 1, Part 3 "Assessment Guidelines".

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this competency standard unit applies. This requires that the specified essential knowledge and associated skills are assessed in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent **9.5)**

© Commonwealth of Australia, 2025 Powering Skills Organisation

assessment and relationship with other units

There are no concurrent assessment recommendations for this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit of competency as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This competency standard unit shall be demonstrated in relation to participating in environmentally sustainable work practices in any of the following disciplines:

- Appliances
- Business equipment
- Computers
- Data Communications
- Electrical
- Electronics
- Fire protection
- Instrumentation and control
- Refrigeration and Air Conditioning
- Renewable / sustainable energy
- Security technology

Generic terms are used throughout this Vocational Standard shall be regarded as part of the Range of Variables in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Not applicable.

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This Competency Standard Unit specifies the outcomes for the collecting, interpretation and application of environmental management information, the identification of environmental impacts and the assessment of risks. It also consists of monitoring while implementing environmentally sustainable work polices and plans an, the development of modifications as part of the review process.

Application of the Unit

Application of the Unit **2)**

This Competency Standard Unit is intended to augment formally acquired competencies. It is suitable for employment-based programs under an approved contract of training. The unit addresses information processes and techniques for the implementation and monitoring of work place procedures that minimise energy use in the workplace.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit may require a licence/registration to practice in the work place subject to regulations for undertaking of electrical work.

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

Practice in workplace and during training is also subject to regulations directly related to Occupational Health and Safety, electricity/telecommunications/gas/water industry safety and compliance, industrial relations, environmental protection, anti discrimination and training. Commonwealth, State/Territory or Local Government legislation and regulations may exist that limits the age of operating certain equipment.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

There are no pre-requisites for this unit

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve this unit if they have reading, writing and maths skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 “Literacy and Numeracy”

Reading 4 Writing 4 Numeracy 4

Employability Skills Information

Employability Skills **5)**

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit	Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA	
1 Prepare/plan to implement and monitor environmentally sustainable work practice management policies and procedures	1.1	Works schedule(s), including drawings, plans, requirements, established procedures, and material lists, are obtained, analysed, if necessary, by site inspection and the extent of the preparation of the work determined for planning and coordination.
	1.2	Work is prioritised and sequenced for the most efficient and effective outcome following consultation with others for completion within acceptable timeframes, to a quality standard and in accordance with established procedures.
	1.3	Relevant requirements (including environmental regulations) and established procedures for the work are given to all personnel and identified for all work sites.
	1.4	Hazards are identified, OHS risks assessed and control measures are prioritised, implemented and monitored to ensure safe systems of work are followed and according to established procedures.
	1.5	Resources including personnel, equipment, tools and personal protective equipment required for the job are identified, scheduled and coordinated and confirmed in a safe and technical working order.
	1.7	Risk management is applied to the job identifying and itemising ways in which energy wastage can be minimised
	1.8	Items for installation are sourced, where

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		possible, that are recycled or reusable, in consultation with an agreement of the customer.
2 Carry out the implementation and monitoring of environmentally sustainable work management policies and procedures	2.1	Environmentally sustainable work practice to reduce/ minimise waste and excessive energy use are implemented and monitored in accordance with requirements and/or established procedures with input being sought from specialists where possible
	2.2	Implementation and monitoring of environmentally sustainable energy management policies and procedures are carried out, in accordance with the work schedule and requirements and/or established procedures.
	2.3	Essential Knowledge and Associated Skills in the safe implementation and monitoring of environmental and sustainable energy management policies and procedures are applied to ensure completion in an agreed timeframe and, to quality standards with a minimum of waste according to requirements.
	2.4	Solutions to non-routine problems are identified and actioned using acquired Essential Knowledge and Associated Skills according to requirements.
	2.5	Ongoing checks of quality of the work are undertaken in accordance with requirements and established procedures to ensure a quality like outcome is achieved for the client/customer and to a community/industry standard.
3 Complete the implementation and monitoring of environmental and sustainable energy management policies and procedures	3.1	Work undertaken is checked against works schedule for conformance with requirements, anomalies reported and solutions identified in accordance with established procedures.
	3.2	Work site is rehabilitated, cleaned up and confirmed safe in accordance with established procedures.
	3.3	Tools, equipment and any surplus resources and materials are, where appropriate, cleaned, checked and returned to storage in accordance

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		with established procedures.
	3.4	Materials suitable for recycling and or reuse are identified and are stored for further use or proper disposal.
	3.5	Policies for implementing and monitoring of sustainable work practices are reviewed and updated from the experience of the current job and new procedures implemented if required.
	3.6	Relevant work permit(s) are signed off and the work completed/returned to service and advised to client/customer in accordance with requirements.
	3.7	New targets for energy minimisation are set, in keeping with successful strategies
	3.8	Successful strategies are promoted and where possible participants rewarded

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired implementing & monitoring, policies & procedures for environmentally sustainable electrotech work practice.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EK145A Environmental and sustainable work practice - supervisory responsibilities

Evidence shall show an understanding of environmentally sustainable work practice, supervisory responsibilities to an extent indicated by the following aspects:

T1 Environmentally sustainable work practice principles encompassing:

- Provisions of relevant environmental legislation

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- Notion of sustainable work practice
- Effects of neglecting sustainable work practice
- The greenhouse effect - causes, consequences.
- International and national greenhouse imperatives.
- The role of regulators and similar bodies
- Economic benefits of sustainable initiatives.
- Techniques for reducing the use of carbon based energy sources and hence greenhouse gas emissions
- domestic, commercial and industrial strategies
- trade related technologies and methods
- renewable energy technologies
- energy efficient retrofits

T2 Implementing and monitoring encompassing:

- Principles and practice of effective sustainable work practice management
- Workplace sustainable work practice non compliance, range and selection of control measures
- Organisational systems and policies and procedures needed for legislative compliance
- Impact of characteristics and composition of the workforce on sustainable work practice management
- Relevance of sustainable work practice management to other organisational management policies, procedures and systems.
- Analysis of entire work environment and judge sustainable work practice interventions
- Analysis of relevant workplace data
- Ability to assess resources needed for risk control.

Evidence Guide

EVIDENCE GUIDE

9) This provides essential advice for assessment of the unit of competency and must be read in conjunction with the performance criteria and the range statement of the unit of competency and the Training Package Assessment Guidelines.

The Evidence Guide forms an integral part of this Competency Standard Unit and shall be used in conjunction with all components parts of this unit and, performed in accordance with the Assessment Guidelines of this Training Package.

prerequisites shall be met.

The evidence on which competency in this unit is based shall be considered holistically for each element on at least two occasions comprising:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range; and
  - Apply sustainable energy principles and practices as specified in the performance criteria and range; and
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements. and
  - Demonstrate an appropriate level of skills enabling employment; and
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures; and
  - Implement and monitor, policies and procedures for environmentally and sustainable electrotech work practice as listed in the Range statement' and including

A	Providing environmentally sustainable work practice information to the work group
B	Implementing and monitoring participative arrangements for the management of environmentally sustainable work practice
C	Implementing and monitoring the procedures for identifying procedures for identifying hazards, assessing risks and controlling risks
D	Implementing the procedures for dealing with hazardous events
E	Implementing and monitoring the procedures for environmentally sustainable work practice
F	Implementing and monitoring the procedures for maintaining environmentally sustainable work

© Commonwealth of Australia, 2025 Powering Skills Organisation

		practice records
	G	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in the holistic assessment with the above listed items

Context of and specific resources for assessment **9.3)**

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual implementation and monitoring of environmental and sustainable energy management policies and procedures.

The resources used for assessment should reflect current industry practices in relation to implementing and monitoring, policies and procedures for environmentally and sustainable electrotech work practice.

Method of assessment **9.4)**

This Competency Standard Unit shall be assessed by methods given in Volume 1, Part 3 “Assessment Guidelines”.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this Competency Standard Unit applies. This requires that the specified Essential Knowledge and Associated Skills are assessed in a structured environment which is primarily intended for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent **9.5)**

assessment and relationship with other units

For optimisation of training and assessment effort, competency development in this unit may be arranged concurrently with units:

UEENEEE117A	Implement and monitor energy sector OHS policies and procedures

Range Statement

RANGE STATEMENT

10) This relates to the unit of competency as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This Competency Standard Unit shall/may be demonstrated in relation to implementing and monitoring, policies and procedures for environmentally and sustainable electrotech work practice and may include the following equipment:

The following constants and variables included in the elements and performance criteria in this unit augment other definitions described in the Definitions section of this Training Package and form an integral part of the Range Statement of this unit:

- Environmental legislation may include relevant federal legislation; relevant state/territory legislation; relevant local government by-laws; relevant government or quasi government policies and regulations; relevant community planning and development agreements (e.g. Land care agreements)
- Environmental management documentation may include information on applicable environmental laws or other requirements; complaint records; training records; process information; process operational log books; inspection, maintenance and calibration records; relevant contractor and supplier information; incident reports; information on emergency preparedness and response.

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Descriptor

Unit Descriptor **1**)

1.1) Descriptor

This unit covers attaching flexible cords and plugs to electrical equipment for connection to supplies up to 230V a.c. This may be incidental to or a primary and regular function of work related to a principle function in the workplace. It encompasses working safely, identifying plug configurations, selecting and using testing and measuring devices, terminating and connecting cords/plugs and conductors, safety testing and reporting.

Application of the Unit

Application of the Unit **4**)

This unit applies to any formal recognition for this standard at the aligned AQF 2 level or higher.

Licensing/Regulatory Information

1.2) License to practice

The skills and knowledge described in this unit may require a license to practice in the workplace. However, practice in this unit is subject to regulations directly related to occupational health and safety and where applicable contracts of training such as apprenticeships.

Note:
Candidates are to meet regulator eligibility requirements by providing formal

Elements and Performance Criteria

ELEMENT	PERFORMANCE CRITERIA	
1	Plan and prepare to attach flexible cord(s) and plug(s).	1.1 Work is planned and prepared to ensure OHS policies and procedures are followed, and the work is appropriately sequenced in accordance with requirements.
		1.2 Condition and ratings under which the flexible cords and plugs are to operate is determined from requirements and in consultation with appropriate personnel followed by written instruction.
		1.3 Flexible cords and plugs are selected to comply with standards and requirements for the condition and rating to be determined.
		1.4 Materials necessary to complete the work are obtained in accordance with established procedures and checked against job requirements.
		1.5 Tools, equipment and testing devices needed to carry out the work are obtained in accordance with established procedures and checked for correct operation and safety.
		1.6 Flexible cord(s) is prepared without damage to insulation and conductors and in accordance with requirements.
2	Attach flexible cord(s) and plug(s).	2.1 OHS policies and procedures are followed.
		2.2 Single insulated metal framed equipment is earthed in accordance with requirements.
		2.3 The integrity of double insulated equipment is maintained in accordance with requirements.
		2.4 Conductors are connected to terminals in accordance with requirements to ensure the required polarity is affected.

© Commonwealth of Australia, 2025 Powering Skills Organisation

3	Test equipment for operation and safety.	3.1 Appropriate tests of the cord(s) and plug(s) connected to the electrical equipment are conducted in accordance with requirements and to established procedures to ensure safe installation and operation.
		3.2 Ongoing checks of the quality of work are undertaken in accordance with established procedures.
4	Locate and repair fault(s) in attached flexible cord(s) and plug(s).	4.1 Electrical equipment and attached flexible cord(s) and plug(s) are isolated, where necessary, in accordance with established procedures.
		4.2 Other OHS policies and procedures are followed.
		4.3 Visual checks of the attached flexible cord(s) and plug(s) are carried out in accordance with established procedures to detect any abnormal or obvious damage or fault.
		4.4 Fault(s) in attached flexible cord(s) and plug(s) are confirmed and components to be replaced are determined and details recorded in accordance with established procedures.
		4.5 Fault(s) in attached flexible cord(s) and plug(s) are repaired in accordance with established procedures, where necessary.
		4.6 Approval is obtained in accordance with established procedures from appropriate personnel, before any contingencies are implemented.
5	Provide status report(s).	5.1 Status report(s) are completed and notified in accordance with established procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

7) This describes the essential skills and knowledge and their level,

© Commonwealth of Australia, 2025 Powering Skills Organisation

required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and attaching cords and plugs to electrical equipment for connection to a single phase 230 Volt supply.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EP024A **Flexible cords and plugs to 230 V**

Evidence shall show an understanding of flexible cords and plugs to 230 V to an extent indicated by the following aspects

T1 Safety encompassing:

* OH&S and electrical safety requirements

* requirements of AS/NZS 4836:2001 Safe working practices on low voltage installations

T2 The basic electrical circuit encompassing:

* simple electric circuit (supply, control device and load)

* symbol, units of measurement and the abbreviation for electromotive force, potential difference, current and resistance.

* drawing of a basic electrical circuit using correct symbols

* using multiples and submultiples for voltage, current and resistance values

* a.c and d.c supplies

* single phase electrical loads

© Commonwealth of Australia, 2025 Powering Skills Organisation

	* electrical circuit protection devices
T3 Relationships in an electrical circuit encompassing:	
	* relationship between voltage, current and resistance (Ohm's law)
	* changes in circuit parameters for altered values of voltage, current and resistance
	* electrical power in relationship to d.c. or resistive a.c. circuits
T4 Test Equipment - resistance measurement encompassing:	
	* types of electrical test equipment used for resistance measurement (analogue and digital multimeters, insulation resistance testers and continuity testers)
	* selection of appropriate electrical test instrument for continuity and insulation resistance measurement
	* using analogue and digital multimeters for resistance measurement (ensuring zero setting, correct scale selection, avoidance of parallax error and estimation of between division readings for analogue multimeters)
	* continuity tests and using a continuity tester to check the polarity of a three core extension cord
	* insulation resistance tests and minimum values for insulation resistance for low voltage equipment
	* reasons for insulation resistance testing is conducted at higher than supply voltage (AS/NZS3000 requirements)
	* using insulation resistance hand held tester
	* care and storage of electrical instruments
	* regulatory requirements in regard to the maintenance and testing of test instrumentation for resistance measurement.
T5 Selection of flexible cords and plugs to suit given applications	

© Commonwealth of Australia, 2025 Powering Skills Organisation

encompassing:

* types , structures and applications of common cores (parallel two core unsheathed (‘figure 8’) cords, light duty sheathed, ordinary duty sheathed, heavy duty sheathed and textile braided)

* determining the current rating of a range of commonly used flexible cords

* service duty

* purpose of colour coding and the recommended single phase colour code and the conventional code used in the most common alternative colours

* selection of appropriate flexible cords for a range of single phase appliances in regard to application, load, and service duty

* identification of correct plug and socket polarities for the range of commonly used 230 volt plug socket combinations

* factors affecting the choice of plugs and sockets including IP rating

* selection of the correct plug and socket combinations for a range of applications including use in damp areas

T6 Connecting flexible cords and plugs to appliances encompassing:

* design features of plugs and sockets which protect the conductor terminations from undue force when disconnecting a cord - tortuous path

* cord preparation - not to mark/damage the inner core when stripping the sheath for termination, double the end of the conductor to be terminated

* purpose of earthing

* structure of double insulated appliances, symbol, reasons they should not be earthed, and maintenance of the integrity of the double insulation

* preparation of the surfaces at an earthing connection before and after completion of the termination including terminations exposed to corrosion, and those

© Commonwealth of Australia, 2025 Powering Skills Organisation

for which no specific earthing terminal is provided

* fitting a range of various plugs and sockets with attention to requirements, colour code, polarity, and correct termination of conductors with the sheath well into the body, and the cord grip anchored

* terminate cords to several appliances utilising the appropriate cord type and rating

T7 Testing encompassing:

* importance of conducting both visual and electrical tests to ensure leads are safe and appropriate for connection to supply in regard to physical condition, sufficiently high insulation resistance, continuity, arrangements for protection against indirect contact are undamaged and in place, appropriate IP rating, and arrangements for protection against dangers of mechanical movement as relevant are undamaged and in place

* check polarity of plug, and for any abnormal or obvious damage or fault

* minimum acceptable value of insulation resistance between active neutral and earth

* conduct insulation resistance and continuity tests prior to, and after, connecting cords and plugs to appliances

* fault finding attached cords and plugs, and cord extension leads

T8 Producing documentation and reports encompassing:

* nature and content of, and the need to produce, status reports and documents

* Producing status reports and documents

Evidence Guide

EVIDENCE GUIDE

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this Unit and shall be used in conjunction with all components parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment

9.**1**)

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous substance/material present a challenge for those determining competence. Sources of evidence need to be 'rich' in nature to minimise error in judgment.

Activities associated with normal everyday work influence decisions about how/how much the data gathered will contribute to its 'richness'. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required

9.**2**)

Before the critical aspects of evidence are considered all

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

to demonstrate competency in this unit

prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines - UEE07'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Attach cords and plugs to electrical equipment for connection to a single phase 230 Volt supply as described in 8) and including:

A Demonstrating consistent performance for each element of the unit

B Meeting the performance criteria associated with each element of competence by employing the techniques, procedures, information and resources available in the workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

C	Demonstrating an understanding of the underpinning knowledge and skills shown in the Essential Knowledge and Associated Skills section of the unit
D	Planning and preparing to attach flexible cord(s) and plug(s) up to 230 V a.c
E	Attaching, replacing and repairing flexible cord(s) and plugs(s) to equipment, safely up to 230 V a.c
F	Testing flexible cord(s), plugs(s) and connected equipment for operation and safety up to 230 V a.c., including polarity and continuity testing
G	Finding and repairing fault(s) in attached flexible cord(s) and plug(s) in accordance with established procedures
H	Providing status report(s)
I	Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Note:
Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.
- Workplace evidence to be produced in an industry/regulator approved recording system (logbook) confirming skills development under appropriate supervision

These should be part of the formal learning/assessment environment.

© Commonwealth of Australia, 2025 Powering Skills Organisation

EVIDENCE GUIDE

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to attaching cords and plugs to electrical equipment for connection to a single phase 230 Volt supply.

Method of assessment

9.4)

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:
Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units

9.5)

There are no concurrent assessment recommendations for this unit

Range Statement

RANGE STATEMENT

8) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to any cord, cable and plug connected equipment or cord extension leads intended for single-phase supplies up to 230 V.

Note:

Limitations of this unit. This unit does not cover the knowledge and skills necessary for work:

© Commonwealth of Australia, 2025 Powering Skills Organisation

RANGE STATEMENT

a) Competencies associated with high current faults

b) On complex electrical apparatus, circuits and electrical work

c) In hazardous areas or on electrical equipment that is part of an explosion protection technique

d) Nor competencies associated with fixed wiring.

Safe Working. Safe procedures for working within in the scope of this unit shall be in accordance with AS/NZS 4836:2001 'Safe working on low-voltage electrical installations.'

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

Unit Sector(s)

Unit Descriptor

Unit Descriptor **1) Scope:**

1.1) Descriptor

This unit covers safety testing of electrical cord connected equipment and cord assemblies. It encompasses working safely, using portable apparatus tester, identifying faults, applying tagging, arranging for repair of faulty equipment and complete testing documentation.

Application of the Unit

Application of the Unit **2)**

This unit is intended to augment previously acquired competencies. It is suitable for employment-based programs under an approved contract of training.

Licensing/Regulatory Information

License to practice **3)**

The skills and knowledge described in this unit may require a license to practice in the workplace. However, practice in this unit is subject to regulations directly

© Commonwealth of Australia, 2025 Powering Skills Organisation

License to practice **3)**

related to occupational health and safety, general electrical safety and where applicable contracts of training such as apprenticeships.

Note:

1. Compliance with permits may be required in various jurisdictions and typically relates to the operation of plant, machinery and equipment such as elevating work platforms, powder operated fixing tools, power operated tools, vehicles, road signage and traffic control and lifting equipment. Permits may also be required for some work environments such as confined spaces, working aloft, near live electrical apparatus and site rehabilitation.

2. Compliance may be required in various jurisdictions relating to currency in First Aid, confined space, lifting and risk safety measures.

Pre-Requisites

Prerequisite Unit(s) **4)**

Competencies **4.1)**

Granting competency in this unit shall be made only after competency in the following unit(s) has/have been confirmed.

UEENEEE101A	Apply Occupational Health and Safety regulations, codes and practices in the workplace

Literacy and numeracy skills **4.2)**

Participants are best equipped to achieve this unit if they have reading, writing and numeracy skills indicated by the following scales. Description of each scale is given in Volume 2, Part 3 ‘Literacy and Numeracy’

Reading 3 Writing 3 Numeracy 3

Employability Skills Information

Employability Skills **5)**

This unit contains Employability Skills

The required outcomes described in this unit of competency contain applicable facets of Employability Skills. The Employability Skills Summary of the qualification in which this unit of competency is packaged will assist in identifying Employability Skill requirements.

Elements and Performance Criteria Pre-Content

6) Elements describe the essential outcomes of a competency standard unit

Performance Criteria describe the required performance needed to demonstrate achievement of the element. Assessment of performance is to be consistent with the Evidence Guide.

Elements and Performance Criteria

ELEMENT		PERFORMANCE CRITERIA	
1	Prepare to test cord connected apparatus and cord assemblies	1.1	OHS procedures for a given work area are identified, obtained and understood.
		1.2	OHS risk control work preparation measures and procedures are followed.
		1.3	Advice is sought from an appropriate person to minimise disruption to the work place.
		1.4	Cord connected apparatus and cord assemblies to be tested are obtained.
		1.5	Portable apparatus testing device is checked for correct operation and safety.
2	Test cord connected apparatus and cord assemblies	2.1	OHS risk control work measures and procedures are followed.
		2.2	Measures are followed to ensure that cord

© Commonwealth of Australia, 2025 Powering Skills Organisation

ELEMENT	PERFORMANCE CRITERIA	
		connected apparatus and cord assemblies to be tested are not connected to the electrical supply.
	2.3	Knowledge of electrical safety requirements and parameters are applied to safety testing to ensure correct interpretation of test results.
	2.4	Visual checks of the cord connected apparatus and cord assemblies are carried out in accordance with established procedures to detect any abnormal or obvious damage or fault.
	2.5	Approval is obtained in accordance with established procedures from appropriate personnel, before any contingencies are implemented.
	2.6	Established PAT routines are followed to test cord connected apparatus and cord assemblies.
	2.7	Unsafe cord connected apparatus and cord assemblies are identified from test results
	2.8	Testing is undertaken effectively with minimum waste of energy and damage to apparatus.
3 Tag tested cord connected apparatus and cord assemblies and document testing activities	3.1	OHS work completion risk control measures and procedures are followed.
	3.2	Work site is cleaned and made safe in accordance with established procedures.
	3.3	Cord connected apparatus and cord assemblies are tagged according to their safety status.
	3.4	Arrangements are made for unsafe cord connected apparatus and cord assemblies to be repaired by a recognised competent person.
	3.5	Safety testing activities are documented in accordance with requirements and established routines procedures.

Required Skills and Knowledge

REQUIRED SKILLS AND KNOWLEDGE

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

8) This describes the essential skills and knowledge and their level, required for this unit.

Evidence shall show that knowledge has been acquired of safe working practices and conduct in-service safety testing of electrical cord connected equipment and cord assemblies.

All knowledge and skills detailed in this unit should be contextualised to current industry practices and technologies.

KS01-EP026A Testing and Tagging Portable and Cord Connected Electrical Apparatus

Evidence shall show an understanding of testing and tagging portable and cord connected electrical apparatus to an extent indicated by the following aspects:

T1 Australian Standards and Commonwealth/State/Territory legislation and regulations encompassing:

- Australian Standard AS/NZS 3760
- Commonwealth/State/Territory Occupational Health and Safety Acts and Regulations
- Limitations of work that can be undertaken
- Codes of Practice and associated guidance material
- Risk management principles

T2 Basic electrical testing concepts encompassing:

- Basic electrical circuits
- Functions of electrical circuit
- Conductors and insulators
- Basic electrical supply system
- Relationship of electrical quantities
- Effects of electrical currents
- Methods/devices used to negate or minimise electrical shock
- Portable Appliance Testers (PAT)
- PAT maintenance and calibration

T3 Electrical equipment and cord assemblies testing encompassing:

- Classification of electrical equipment
- Inspection of electrical equipment (visual inspections)
- Using PAT:
  - Earth continuity testing
  - Insulation resistance testing
  - Polarity testing (extension cords and IEC cords)

T4 Testing and tagging documentation requirements encompassing:

- Risk assessment documentation

© Commonwealth of Australia, 2025 Powering Skills Organisation

REQUIRED SKILLS AND KNOWLEDGE

- frequency of inspection and testing
- tagging of equipment
- records maintenance

Evidence Guide

EVIDENCE GUIDE

9) The evidence guide provides advice on assessment and must be read in conjunction with the Performance Criteria, Required Skills and Knowledge, the Range Statement and the Assessment Guidelines for this Training Package.

The Evidence Guide forms an integral part of this Unit and shall be used in conjunction with all components parts of this unit and performed in accordance with the Assessment Guidelines of this Training Package.

Overview of Assessment **9.1)**

Longitudinal competency development approaches to assessment, such as Profiling, require data to be reliably gathered in a form that can be consistently interpreted over time. This approach is best utilised in Apprenticeship programs and reduces assessment intervention. It is the industry-preferred model for apprenticeships. However, where summative (or final) assessment is used it is to include the application of the competency in the normal work environment or, at a minimum, the application of the competency in a realistically simulated work environment. In some circumstances, assessment in part or full can occur outside the workplace. However, it must be in accordance with industry and regulatory policy.

Methods chosen for a particular assessment will be influenced by various factors. These include the extent of the assessment, the most effective locations for the assessment activities to take place, access to physical resources, additional safety measures that may be required and the critical nature of the competencies being assessed.

The critical safety issues inherent in working with electricity, electrical equipment, gas or any other hazardous substance/material present a challenge for those determining competence. Sources of evidence need to be ‘rich’ in nature to minimise error in judgment.

Activities associated with normal everyday work influence decisions about how/how much the data gathered will contribute to its ‘richness’. Some skills are more critical to safety and operational requirements while the same skills may be more or less frequently practised. These points are raised for the assessors

© Commonwealth of Australia, 2025 Powering Skills Organisation

to consider when choosing an assessment method and developing assessment instruments. Sample assessment instruments are included for Assessors in the Assessment Guidelines of this Training Package.

Critical aspects of evidence required to demonstrate competency in this unit

9.2)

9.2)

Before the critical aspects of evidence are considered all prerequisites shall be met.

Evidence for competence in this unit shall be considered holistically. Each element and associated performance criteria shall be demonstrated on at least two occasions in accordance with the 'Assessment Guidelines – UEE11'. Evidence shall also comprise:

- A representative body of work performance demonstrated within the timeframes typically expected of the discipline, work function and industrial environment. In particular this shall incorporate evidence that shows a candidate is able to:
  - Implement Occupational Health and Safety workplace procedures and practices including the use of risk control measures as specified in the performance criteria and range statement
  - Apply sustainable energy principles and practices as specified in the performance criteria and range statement
  - Demonstrate an understanding of the essential knowledge and associated skills as described in this unit. It may be required by some jurisdictions that RTOs provide a percentile graded result for the purpose of regulatory or licensing requirements.
  - Demonstrate an appropriate level of skills enabling employment
  - Conduct work observing the relevant Anti Discrimination legislation, regulations, polices and workplace procedures
- Demonstrated consistent performance across a representative range of contexts from the prescribed items below:
  - Conduct in-service safety testing of electrical cord

© Commonwealth of Australia, 2025 Powering Skills Organisation

connected equipment and cord assemblies as described in 8) and including:

a. Preparing the portable apparatus tester
b. Connecting cords and apparatus to the testing apparatus
c. Using test results to establish the safety status
d. Identifying safe and unsafe cords and apparatus
e. Applying appropriate tagging
f. Documenting testing activities
g. Dealing with unplanned events by drawing on essential knowledge and skills to provide appropriate solutions incorporated in a holistic assessment with the above listed items

Note:

Successful completion of relevant vendor training may be used to contribute to evidence on which competency is deemed. In these cases the alignment of outcomes of vendor training with performance criteria and critical aspects of evidence shall be clearly identified.

Context of and specific resources for assessment

9.3)

This unit should be assessed as it relates to normal work practice using procedures, information and resources typical of a workplace. This should include:

- OHS policy and work procedures and instructions.
- Suitable work environment, facilities, equipment and materials to undertake actual work as prescribed by this unit.
- Workplace evidence to be produced in an industry/regulator approved recording system (logbook) confirming skills development under appropriate supervision

These should be part of the formal learning/assessment environment.

Note:

Where simulation is considered a suitable strategy for assessment, conditions must be authentic and as far as possible reproduce and replicate the workplace and be consistent with the approved industry simulation policy.

The resources used for assessment should reflect current industry practices in relation to conducting in-service safety testing of

© Commonwealth of Australia, 2025 Powering Skills Organisation

electrical cord connected equipment and cord assemblies.

Method of assessment **9.4)**

This unit shall be assessed by methods given in Volume 1, Part 3 'Assessment Guidelines'.

Note:

Competent performance with inherent safe working practices is expected in the Industry to which this unit applies. This requires assessment in a structured environment which is intended primarily for learning/assessment and incorporates all necessary equipment and facilities for learners to develop and demonstrate the essential knowledge and skills described in this unit.

Concurrent assessment and relationship with other units **9.5)**

There are no concurrent assessment recommendations for this unit.

Range Statement

RANGE STATEMENT

10) This relates to the unit as a whole providing the range of contexts and conditions to which the performance criteria apply. It allows for different work environments and situations that will affect performance.

This unit shall be demonstrated in relation to in-service safety testing of at least two different electrical cords and two different items of cord connected equipment with safety faults.

Safe Working. Safe procedures for working within in the scope of this unit shall be in accordance with AS/NZS 4836 'Safe working on low-voltage electrical installations.'

Generic terms used throughout this Vocational Standard shall be regarded as part of the Range Statement in which competency is demonstrated. The definition of these and other terms that apply are given in Volume 2, Part 2.1.

UEPMNT201 Carry out routine work activities in an electricity supply industry generation environment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake scheduled routine work activities in the electricity supply industry generation sector.

Routine work can include undertaking functions encompassing activities such as the operation of non-critical generation plant systems, lubricating plant and performing minor maintenance on both electrical and mechanical equipment. Tasks may also involve cleaning, warehousing, stock duties and the operation of load shifting equipment.

Competency in this unit requires the ability carry out routine work activities in an electrical supply generation environment. Individuals will work, under supervision, as an operator in a power generation facility.

No licensing, legislative or certification requirements apply to unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare to undertake routine work activities	**1.1** Instructions for work activities, including permits to work, are identified and confirmed, in accordance with workplace procedures
	1.2 Work, Health and Safety(WHS)/Occupational Health and Safety (OHS) procedures are identified and confirmed for use, in accordance with workplace procedures
	1.3 Tools, equipment and Personnel Protective Equipment are identified and checked to ensure they are safe to use, in accordance with workplace procedures
	1.4 Appropriate personnel are consulted, in accordance with workplace procedures, to ensure work is coordinated at site with others
	1.5 Resources and materials are confirmed and obtained, in accordance with workplace procedures
	1.6 Schedule of work, including practices for working safely such as the use of Material Safety Data Sheets (MSDS), manual handling techniques and personal protective equipment are confirmed, in accordance with workplace procedures
2 Carry out work activities	**2.1** Hazards are identified and risk controls are implemented, in accordance with workplace procedures
	2.2 Schedule of work is followed, in accordance with workplace procedures, to ensure work activities are completed
	2.3 Work practices, applicable to electricity supply industry, are applied, in accordance with workplace procedures
	2.4 Instructions are sought, if required, in accordance with workplace procedures, from appropriate personnel when unplanned events occur
	2.5 Continuous checks on work quality are undertaken, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

3 Check completed work activities	**3.1** Final checks are made to ensure work conforms with instructions and requirements
	3.2 Appropriate personnel are notified of work completion, in accordance with workplace procedures
	3.3 Tools, equipment, resources and materials are cleaned, checked and returned to storage, in accordance with workplace procedures
	3.4 Work area is cleaned and made safe, in accordance with workplace procedures, using sustainable energy practices
	3.5 Records are updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT201A Carry out routine work activities in an electricity supply industry generation environment.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPMNT201 Carry out routine work activities in an electricity supply industry generation environment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying sustainable energy practices
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including
  - emergency procedures
  - hazard identification
  - personal protective equipment (PPE)
  - risk control measures
  - safe working practices
- checking work results
- communicating with personnel
- completing lubrication, servicing and maintenance activities
- complying with legislation, industry standards, codes of practice and regulations
- dealing with unplanned events
- interpreting manufactures' specifications and manuals
- preparing to undertake routine work activities
- using permit to work system, Material Data Safety Sheets (MSDS) and manual handling techniques
- using tools, resources, materials and permits

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- cleaning methods and tools

© Commonwealth of Australia, 2025 Powering Skills Organisation

- cleaning solvents
- electrical supply industry routine tasks
- legislation, industry standards, codes of practice and regulations
- lubrication, service and maintenance requirements
- manual handling techniques
- manufacturers' specifications and manuals
- Material Data Safety Sheets (MSDS)
- permit to work system
- potential hazards
- sustainable energy practices
- types of power generation plant
- WHS/OHS legislated requirements including
  - emergency procedures
  - hazard identification
  - personal protective equipment
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT202 Carry out routine work activities in an ESI large scale wind generation environment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake scheduled routine work activities in the Electricity Supply Industry (ESI) - large scale wind generation environment.

Routine work activities can include undertaking tasks such as the operation of non-critical plant systems, lubricating plant, performing minor maintenance on electrical and mechanical equipment, cleaning plant, performing warehousing stock duties and operating mobile load shifting equipment.

Competency in this unit requires the ability carry out routine work activities in an electrical supply generation environment - wind. Individuals will work, under supervision, as a maintenance operative in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Assessment Requirements for UEPMNT202 Carry out routine work activities in an ESI large scale wind generation environment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - identifying hazards
  - risk control measures
  - safe working practices
- carrying out routine work activities including servicing and maintenance tasks
- checking results
- communicating with personnel
- completing work
- complying with legislation, industry standards, codes of practice and regulations
- interpreting manufactures' specifications and manuals
- performing routine activities using Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)
- preparing to undertake routine work activities
- using tools, resources, materials and personal protective equipment
- working with maintenance schedules

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- legislation, industry standards, codes of practice and regulations
- maintenance schedules
- manufacturers' specifications and manuals workplace documentation
- routine work activities including servicing and maintenance tasks

UEPMNT302 Install and maintain industrial pipe work

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake work associated with the installation, maintenance and fabrication of industrial pipe work, which may also involve fault finding and repairs.

Industrial piping is used to convey fluids, liquids and gases from one location to another. Pipe fabrication is the process of making and assembling industrial pipe work to suit each power generation facility's requirements.

Competency in this unit requires the ability to plan work, fabricate and install industrial pipe work, maintain industrial pipe work and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or no site

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Occupational Health and Safety (OHS)/Work, Health and Safety (WHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with the work procedures
	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace
	1.7 Potential hazards are identified, and risk control measures, are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Fabricate and install pipe	**2.1** Isolations are confirmed, where appropriate, in

© Commonwealth of Australia, 2025 Powering Skills Organisation

work		accordance with workplace procedures
	2.2	Pipe runs are identified, calculations performed and sketches made of planned installation in accordance with workplace procedures
	2.3	Pipe work is fabricated, using appropriate techniques and equipment, in accordance with workplace procedures
	2.4	Pipe work is levelled and aligned, and installed or coupled, in accordance with the workplace procedures
3 Maintain industrial pipework	**3.1**	Pipe work found to be faulty is repaired and replaced to conform to site requirements or manufacturers' specifications, in accordance with workplace procedures
	3.2	Pipe work modifications and alterations are undertaken, in accordance with workplace procedures, site requirements and manufacturers' specifications
	3.3	Machinery and/or plant is returned to service, and pipe work is monitored and adjusted, in accordance with workplace procedures
4 Complete work	**4.1**	Work is completed, and appropriate personnel notified, in accordance with workplace procedures
	4.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	4.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	4.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Assessment Requirements for UEPMNT302 Install and maintain industrial pipe work

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing data using analysis techniques
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled requirements
- determining work to permit requirements
- dismantling and reassembling industrial pipework using approved techniques
- fabricating and installing industrial pipe work using installation and fabrication techniques and procedures maintain industrial pipe work using maintenance techniques and procedures
- fabricating and installing industrial pipework
- implementing legislation, relevant industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- interpreting technical drawings and data
- planning for installation and maintenance pipe work
- recognising worn or damaged components
- selecting materials and components
- undertaking measurements with measuring equipment
- using tools
- utilising testing techniques
- working with pipe levelling and alignment techniques

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the

© Commonwealth of Australia, 2025 Powering Skills Organisation

requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- data analysis techniques
- isolations
- legislation, industry standards, codes of practices and regulations
- maintenance of industrial pipework
- manufacturers' specifications and manuals
- materials and components
- measuring equipment
- permit to work system
- pipe levelling and alignment techniques
- pipe work fabrication and installation techniques
- technical drawings and plans
- techniques for dismantling and reassembling industrial pipes recognition of worn or damaged components
- testing techniques
- tools
- types and characteristics of industrial pipe work
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPMNT303 Maintain mechanical valves

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake fault finding, diagnosis, repair and/or overhaul of mechanical valves, excluding any associated servo or actuating unit.

Fault finding is the process of undertaking an investigation into the cause of a mechanical valve malfunction and then performing repairs to ensure optimal performance of equipment and plant.

Competency in this unit requires the ability to plan work, remove mechanical valves for maintenance, perform mechanical valve maintenance, replace and/or install valves and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT304 Maintain mechanical pumps

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the installation and maintenance of mechanical pumps (no more than basic alignment). Pump maintenance, including installation, is undertaken to ensure optimal performance of equipment and plant in a power generation facility.

Competency in this unit requires the ability to plan work, remove mechanical pumps for maintenance, maintain mechanical pumps, replace and/or install mechanical pumps and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT305 Maintain industrial fans

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to maintain and/or overhaul industrial fans. It may involve fault finding, diagnosis, repair and may require the removal and replacement of rotating elements with modulating controls.

Industrial fans typically provide a large flow of air or gas to power or cool a power generation facility's plant and equipment. The diagnosis and repair of faults requires the systematic investigation of any industrial fan malfunction.

Competency in this unit requires the ability to plan work, remove industrial fans for maintenance, maintain industrial fans, replace and/or install industrial fans and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Assessment Requirements for UEPMNT305 Maintain industrial fans

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work using completing work procedures
- determining installation techniques and procedures
- dismantling and assembling components
- identifying and using measuring equipment
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- maintaining industrial fans
- planning and preparing for industrial fan maintenance work
- recognising worn or damaged components
- removing industrial fan for maintenance
- replacing and installing industrial fans
- selecting materials and components
- using removal and balancing techniques
- using tools
- utilising permit to work system
- working with maintenance techniques and procedures including coupling, levelling, aligning and working to defined tolerances

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the

© Commonwealth of Australia, 2025 Powering Skills Organisation

requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- defined tolerances
- dismantle and reassemble techniques
- legislation, industry standards, codes of practice and regulations
- maintain industrial fans
- manufacturers' specifications and manuals
- measurement equipment
- permit to work system
- recognition of worn or damaged components
- selection of materials and components
- techniques for coupling, levelling and alignment
- tool use
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry

UEPMNT307 Maintain industrial screens, strainers and filters

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake fault finding, diagnosis, repair and/or overhaul of industrial screens, strainers and filters.

Industrial screens, strainers and filters are used in the filtration, separation, extraction and absorption of liquids or solids in a power generation facility's machinery and plant. The diagnosis and repair of faults requires the systematic investigation of any industrial screen, strainer and filter malfunction.

Competency in this unit requires the ability to plan work, remove industrial screens, strainers and filters for maintenance, maintain industrial screens, strainers and filters, replace and/or install industrial screens, strainers and filters and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources for work activities are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Remove screens, strainers and filters for	**2.1** Isolations are confirmed, where appropriate, in

© Commonwealth of Australia, 2025 Powering Skills Organisation

maintenance		accordance with workplace procedures
	2.2	Screens, strainers and filters are disconnected, in accordance with workplace procedures
	2.3	Screens, strainers and filters are removed, in a manner which will assist in replacement, in accordance with workplace procedures
	2.4	Screens, strainers and filters are inspected for abnormalities, in accordance with workplace procedures
3 Maintain screens, strainers and filters	**3.1**	Equipment isolation and depressurisation is confirmed visually and manually, as required, in accordance with workplace procedures
	3.2	Plant and/or equipment including screen, strainer and filter components, assemblies and/or subassemblies, are identified and prepared for maintenance, in accordance with workplace procedures
	3.3	Equipment, including screens, strainers and filters are removed, cleaned and marked for identification, in accordance with workplace procedures
	3.4	Faulty items are repaired or overhauled, using appropriate principles, techniques and industry standards, in accordance with the workplace procedures
	3.5	Replacement items for installation are selected and inspected, in accordance with manufacturers' specification and workplace procedures
	3.6	Modifications or alterations outside of the manufacturers' specification are approved by appropriate personnel, in accordance with workplace procedures
	3.7	Component failures are identified and probable causes are reported, in accordance with workplace procedures
	3.8	Components or subassemblies are refitted, in accordance with workplace procedures and manufacturers' specification
	3.9	All fastenings are torqued, in accordance with workplace procedures and manufacturers' specification
4 Replace screens, strainers and filters	**4.1**	Equipment and plant is prepared for screens, strainers and filter replacements, in accordance with workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

		procedures
	4.2	Screens, strainers and filters are replaced, in accordance with workplace procedures and manufacturers' specification
	4.3	Screens, strainers and filters are levelled, aligned and coupled, in accordance with workplace procedures
	4.4	All fastenings are torqued, in accordance with workplace procedures and manufacturers' specification
	4.5	Equipment and plant including screens, strainers and filters, are given a test run and are monitored and adjusted, as required, in accordance with workplace procedures and manufacturers' specification
5 Complete work	**5.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	5.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	5.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	5.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT307B Maintain industrial screens, strainers and filters.

Assessment Requirements for UEPMNT307 Maintain industrial screens, strainers and filters

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled requirements
- dismantling and assembling components
- identifying permit to work system requirements
- interpreting manufacturers' specifications and manuals
- maintaining industrial screens, strainers and filters
- planning for industrial screen, strainer and filter maintenance work
- reading technical drawings and data
- removing industrial screens, strainers and filters for maintenance
- replacing and installing screens, strainers and filters
- using removal, maintenance and installing techniques and procedures
- utilising valve levelling and alignment techniques
- working with measuring equipment and tools

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- how to dismantle and assemble components
- installation and maintenance techniques

© Commonwealth of Australia, 2025 Powering Skills Organisation

- legislation, industry standards, codes of practice and regulations
- levelling and alignment techniques
- maintenance of industrial screens, strainers and filters
- manufacturers' specifications and manuals
- measuring equipment
- permit to work system
- screen and filter types and characteristics
- technical drawings and data use
- tool use
- valve levelling and alignment techniques
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPMNT308 Maintain conveyors and associated equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake fault finding, diagnosis, adjustments, exchange of rollers and preparations for belt splicing and/or repairs of conveyors and associated equipment.

A conveyor system is a continuous moving band of fabric, rubber or metal used for transporting bulk materials from one place to another in a power generation facility.

Competency in this unit requires the ability to plan work, remove associated equipment to facilitate maintenance, maintain conveyors and/or associated equipment, replace and/or install conveyors and/or associated equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT309 Maintain material feeders

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake fault finding, diagnosis, out of service inspection (internal or external), repairs and/or overhaul of material feeders.

Material feeders are used to regulate the flow of bulk materials from bins and hoppers. They can be used in conjunction with other types of material handling equipment such as conveyors in a power generation facility.

Competency in this unit requires the ability to plan work, conduct in-service testing, remove equipment to facilitate maintenance of material feeders, maintain material feeders, replace or install material feeders and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT310 Maintain material crushers

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake in-servicing, fault finding, diagnosis, out of service inspection, repair or overhaul of material crushers including roll and/or door assemblies.

Material crushers are used to reduce solid materials, they operate by using components such as balls, jaws or rollers that move or turn together with great force.

Competency in this unit requires the ability to plan work, conduct in-service testing of material crushers, remove material crusher's equipment to facilitate maintenance, maintain material crushers, replace and/or install material crushers and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with the workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Conduct in-service testing	**2.1** In-service tests are carried out, in accordance with

© Commonwealth of Australia, 2025 Powering Skills Organisation

		workplace procedures
	2.2	Faults are located, in accordance with workplace procedures, using appropriate tools, equipment and testing techniques
	2.3	Testing and fault finding results are analysed, in accordance with workplace procedures, to establish repairs or ascertain serviceability of material crusher
3 Remove equipment to facilitate maintenance	**3.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures and site requirements
	3.2	Material crushers are disconnected, in accordance with workplace procedures
	3.3	Material crusher components are removed, in a manner which will assist in replacement, in accordance with workplace procedures
	3.4	Material crusher components are inspected for abnormalities, in accordance with workplace procedures
4 Maintain material crushers	**4.1**	Components or subassemblies are dismantled, cleaned and examined to verify tolerances, in accordance with workplace procedures, to determine need to replace, overhaul or repair material crusher
	4.2	Sketches are made, data noted and components are marked for identification for reassembly or overhaul, in accordance with workplace procedures
	4.3	Dimensional inspection is performed, in accordance with workplace procedures, using precision measuring devices to determine compliance with relevant drawings and/or manufacturers' specification
	4.4	New components are inspected for compliance with manufacturers' specification and are prepared for assembly, in accordance with workplace procedures
	4.5	Components are weighed, measured and recorded, in accordance with workplace procedures and site requirements
	4.6	Components are reassembled and preliminary balance of equipment is obtained, maintained and adjusted by assembling components sequentially by appropriate

© Commonwealth of Australia, 2025 Powering Skills Organisation

		weight, in accordance with workplace procedures
	4.7	Plant and machinery is adjusted using appropriate techniques, in accordance with workplace procedures, manufacturers' specification and site tolerances
	4.8	All fastenings are torqued, in accordance with workplace procedures and manufacturers' specifications
	4.9	Components are levelled and aligned, using appropriate tools, in accordance with workplace procedures
5 Replace/install material crushers	**5.1**	Equipment is prepared for material crushers to be replaced, in accordance with workplace procedures
	5.2	Material crushers are replaced, in accordance with workplace procedures and manufacturers' specification
	5.3	Alterations or corrections are undertaken, in accordance with workplace procedures
	5.4	Material crushers are levelled, aligned and coupled, in accordance with workplace procedures
	5.5	All fastenings are torqued, in accordance with workplace procedures, manufacturers' specification and site requirements
	5.6	Material crushers are given a test run and are monitored, as required, in accordance with workplace procedures and manufacturers' specification
6 Complete work	**6.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	6.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	6.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	6.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT310B Maintain material crushers.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPMNT310 Maintain material crushers

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled arrangements
- conducting material crusher in-service testing using in-service testing procedures to identify faults
- determining measuring equipment
- dismantling and reassembling components
- interpreting technical drawings, manufacturers' specifications and manuals
- maintaining material crushers using maintenance techniques and procedures
- planning for material crusher maintenance work
- removing equipment to facilitate material crusher maintenance using removal techniques
- replacing and installing material crushers using removal and installation techniques and procedures
- selecting materials and components
- testing, adjusting, replacing and overhauling crushers for desired material sizing
- using tools including specialised tools and jigs
- utilising levelling and alignment techniques
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes

© Commonwealth of Australia, 2025 Powering Skills Organisation

knowledge of:

- component dismantling and reassembly
- crusher types and operating characteristics
- identification and use of measuring equipment
- legislation, industry standards, codes of practice and regulations
- maintenance of material crushers
- manufacturers' specifications and manuals
- materials and components
- permit to work system
- technical drawings
- tests, adjustments, replacements and overhaul requirements material crushers
- tolerances
- tools including specialised tools and jigs
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions. Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT312 Maintain industrial pressure vessels

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to maintain boiler pressure parts, pressure vessels and associated components.

Pressure vessels are designed to hold gas or liquids at a pressure substantially different from the ambient pressure, they are used in conjunction with mechanical plant and equipment in a power generation facility. Maintaining boiler pressure parts, pressure vessels and associated components will include monitoring and verifying equipment is operating efficiently.

Competency in this unit requires the ability to plan work, remove associated equipment to facilitate maintenance, dismantle and maintain pressure vessel, reassemble pressure vessel and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

MEM18006C Repair and fit engineering components

MEM09002B Interpret technical drawing

MEM12023A Perform engineering measurements

MEM18001C Use hand tools

MEM18002B Use power tools/hand held operations

MEM18003C Use tools for precision work

MEM18055B Dismantle, replace and assemble engineering components

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned sequenced, prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Remove associated equipment to facilitate	**2.1** Associated equipment isolation and depressurisation is confirmed visually and manually, as required, in

© Commonwealth of Australia, 2025 Powering Skills Organisation

maintenance		accordance with workplace procedures
	2.2	Pressure vessel is disconnected, in accordance with the workplace procedures
	2.3	Pressure vessel's associated equipment is removed, in a manner which will assist in replacement, in accordance with workplace procedures
	2.4	Pressure vessel is inspected for abnormalities, in accordance with workplace procedures
3 Dismantle and maintain pressure vessel	**3.1**	Hazardous material is identified and arrangements are made for clearance from pressure vessel and work site, in accordance with workplace procedures and legislative requirements
	3.2	Internal and external components are systematically dismantled, marked and recorded, in accordance with workplace procedures
	3.3	Components are refurbished, catalogued and stored for reassembly, in accordance with workplace procedures and manufacturers' specifications
	3.4	Gasket and seal requirements are assessed, manufactured or obtained, in accordance with workplace procedures and manufacturers' specifications
	3.5	Vessel mountings are maintained, as required, in accordance with workplace procedures and manufacturers' specifications
	3.6	Internal piping or tubing is tested and expanded or replaced, as required, in accordance with workplace procedures and manufacturers' specifications
4 Reassemble pressure vessel	**4.1**	Internal and external components are systematically reassembled, in accordance with workplace procedures and manufacturers' specifications
	4.2	Associated equipment is aligned and replaced, in accordance with workplace procedures
	4.3	Fastenings are torqued, in accordance with manufactures' specification and workplace procedures
	4.4	Vessel is pressure tested, monitored and adjusted, if required, in accordance with workplace procedures, and

© Commonwealth of Australia, 2025 Powering Skills Organisation

		legislative requirements
5	**Complete work**	**5.1** Work is completed and appropriate personnel are notified, in accordance with workplace procedures
		5.2 Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
		5.3 Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
		5.4 Work completion details are finalised, in accordance with workplace procedures

UEPMNT314 Maintain hydro turbines

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to maintain hydro turbines including their removal from service and the completion of overhauls.

An overhaul includes a thorough examination of the hydro turbine, with repairs or changes made, if required. This may mean taking apart the hydro turbine to examine and repair it.

Competency in this unit requires the ability to plan work, disassemble a hydro turbine, inspect a hydro turbine's components, repair a hydro turbine and/or its' components and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or onsite.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

UEPMNT317 Diagnose and repair faults in mechanical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to diagnose and repair faults in a range of mechanical equipment; this may entail work to be carried out whilst machinery or power generation plant is online.

Diagnosing and repairing faults in mechanical equipment includes locating faults, overhauling equipment and/or fitting and adjusting mechanical equipment to meet power generation facility requirements.

Competency in this unit requires the ability to plan work, verify mechanical equipment faults, find mechanical equipment faults, determine the cause of mechanical equipment faults, repair or rectify mechanical equipment faults and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic, and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. UEPMNT318 Conduct generator mechanical maintenance

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct mechanical maintenance on an electrical generating unit.

A power generation facility typically maintains several independent generating units which can be brought online or taken offline as demand fluctuates in the system. Regular maintenance ensures that all electrical generating units are operating to maximum efficiency.

Competency in this unit requires the ability to plan work, remove associated equipment, perform generator maintenance, replace generator associated equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic, and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned tasks are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

2 Remove associated equipment	**2.1** Work notations are confirmed, in accordance with workplace procedures
	2.2 Associated generator equipment is disconnected, in accordance with workplace procedures
	2.3 Associated generator equipment is removed, in accordance with workplace procedures
	2.4 Associated generator equipment is inspected for abnormalities, in accordance with workplace procedures
3 Perform generator maintenance	**3.1** Generator maintenance is performed, in accordance with workplace procedures and manufacturers' specification
	3.2 Generator is dismantled, clearly marked for identification and relevant data or sketches are noted or drawn, in accordance with workplace procedures
	3.3 Components are prepared for reassembly, in accordance with manufacturers' drawings or manuals and workplace procedures
	3.4 New components are inspected, in accordance with workplace procedures, to ensure compliance with manufacturers' specification
	3.5 Dimensional inspection is performed, in accordance with workplace procedures, on generator and components to ensure compliance with manufacturers' specifications
	3.6 Components are reassembled for testing, in accordance with workplace procedures and manufacturers' specification
	3.7 Components are levelled, aligned and coupled, in accordance with workplace procedures and manufacturers' specification
4 Replace generator associated equipment	**4.1** Associated generator equipment is replaced and connected, in accordance with workplace procedures
	4.2 Generator is rotated and checks are carried out, in accordance with workplace procedures, to ensure operating conditions are in accordance with manufacturers' specifications
	4.3 Modifications outside of manufacturers' specifications

© Commonwealth of Australia, 2025 Powering Skills Organisation

		are approved by appropriate personnel and are documented, in accordance with workplace procedures
	4.4	Final inspection is completed, in accordance with workplace procedures
5 Complete work	**5.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	5.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	5.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	5.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT318B Conduct generator mechanical maintenance.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPMNT318 Conduct generator mechanical maintenance

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - ascertaining hazardous materials
  - emergency procedures
  - risk control measures
  - safe working practices
- assembling and disassembling equipment
- balancing, levelling and aligning
- communicating with personnel
- completing work as per scheduling requirements
- conducting transmissions and/or couplings
- determining permit to work
- identifying components including recognising worn, damaged or faulty components
- interpreting technical drawing, manufacturers' specifications and manuals
- performing generator mechanical maintenance using overhaul and maintenance techniques and procedures
- planning for generator mechanical maintenance work
- removing generator mechanical associated equipment using removal techniques and procedures
- replacing generator mechanical associated equipment using replacement techniques and procedures
- undertaking isolations
- using tools and measuring equipment
- utilising assessment and data analysis techniques and tools
- working with diagnosis and testing techniques

© Commonwealth of Australia, 2025 Powering Skills Organisation

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- advanced balancing, levelling and aligning techniques
- construction of mechanical generators
- diagnostic and testing techniques
- generator mechanical maintenance
- isolations
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications
- measuring equipment
- permit to work system
- plant and equipment and its location
- technical drawings and plans
- tools
- transmissions and couplings
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - ascertaining hazardous materials
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions. Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment

UEPMNT340 Fabricate metal structures and components

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to fabricate metal structures and components required to facilitate the installation, modification and maintenance of equipment associated with the electricity supply industry generation sector.

Fabrication is the construction of metal structures and components using cutting, bending and assembling processes.

Competency in this unit requires the ability to plan work, fabricate structures and components and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT346 Maintain electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the maintenance of electrical equipment including, but not limited to, rotating and static machines, appliances, luminaries and associated control equipment, but it excludes High Voltage (H.V.) equipment.

Maintenance is an essential part of the ongoing care and upkeep of electrical equipment, defined as any machine, simple or complex, powered by electricity in a power generation facility, that is undertaken to ensure optimal efficiency.

Competency in this unit requires the ability to plan work, carry out maintenance on electrical equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

UEENEEG063A Arrange circuits, control and protection for general electrical installations

UEENEEG101A Solve problems in electromagnetic devices and related circuits

© Commonwealth of Australia, 2025 Powering Skills Organisation

UEENEEG102A Solve problems in low voltage A.C. circuits

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

UEPMNT348 Maintain electrical electronic equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the maintenance of electronic electrical equipment containing solid state components, complex control panels and complex control equipment.

Maintenance includes performing inspections, testing, measurement, replacement and adjustments on electrical electronic equipment to ensure optimal efficiently.

Competency in this unit requires the ability to plan work, carry out maintenance on electronic electrical equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE107A Use drawings, diagrams, schedules, standards, cords and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

		procedures
	2.2	Electrical electronic equipment is maintained using appropriate plans, drawings and manuals, in accordance with workplace procedures
	2.3	Resets or adjustments, are carried out, in accordance with workplace procedures
	2.4	Maintenance, reset or adjustment is completed, in accordance with workplace procedures, without damage or loss to other equipment
	2.5	Final inspection is carried out, in accordance with workplace procedures
3 Complete work	**3.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	3.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	3.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	3.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT348B Maintain electrical electronic equipment.

Assessment Requirements for UEPMNT348 Maintain electrical electronic equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control procedures
  - safe working practices
- carrying out electrical electronic maintenance using maintenance procedures
- communicating with personnel
- completing work
- determining permit to work requirements
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- maintaining electrical electronic equipment
- operating with installation techniques and procedures
- planning for electrical electronic equipment maintenance work
- selecting materials
- using tools and equipment
- utilising data analysis techniques and tools
- working with test and measurement instruments

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- characteristics and operation of electronic equipment
- electrical installation practices

© Commonwealth of Australia, 2025 Powering Skills Organisation

- equipment and materials
- legislation, industry standards, codes of practice and regulations
- maintaining electrical electronic equipment
- maintenance techniques
- manufacturers' specifications and manuals
- permit to work system
- plant and equipment, and its location
- test and measurement instruments
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control procedures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT350 Modify electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to perform modifications to electrical equipment which may include, but is not limited to alterations, additions or adjustments.

Electrical equipment is any machine, simple or complex, powered by electricity used in a power generation facility. Modifications can include any changes to electrical equipment which may alter it from the manufacturers' specifications.

Competency in this unit requires the ability to plan work, modifying electrical equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or onsite.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

UEENEEG063A Arrange circuits, control and protection for general electrical installations

UEENEEG101A Solve problems in electromagnetic devices and related circuits

UEENEEG102A Solve problems in low voltage A.C. circuits

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Carry out electrical	**2.1** Isolations are confirmed, in accordance with workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

equipment modifications		procedures
	2.2	Electrical equipment is modified using appropriate plans, drawings and manuals, in accordance with workplace procedures
	2.3	Modifications on electrical equipment are carried out, in accordance with workplace procedures, without damage or loss to other equipment
	2.4	Modified electrical equipment is set up to meet operational requirements, in accordance with workplace procedures and manufacturers' specification
	2.5	Final inspection on electrical equipment is performed, in accordance with workplace procedures
3 Complete work	**3.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	3.2	Work area is cleared of waste, cleaned, restored and secured in accordance with workplace procedures
	3.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	3.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

UEPMNT351 Test and commission electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct testing and commissioning of electrical wiring systems and equipment.

Commissioning and testing is the process of ensuring that all electrical wiring systems which includes cabling and associated devices such as switches, distribution boards, sockets and fittings and equipment in a power generation facility are meeting operational requirements.

Competency in this unit requires the ability to plan work, test wiring systems, test electrical equipment, commission electrical equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

		with workplace procedures
	1.8	Work area is prepared, in accordance with workplace procedures and requirements
2 Test electrical wiring systems	**2.1**	Isolations for work are confirmed, in accordance with workplace procedures
	2.2	Electrical wiring systems are tested using appropriate plans, drawings and manuals, in accordance with workplace procedures
	2.3	Electrical wiring systems, including enclosures and/or supports, are inspected in accordance with workplace procedures, prior to testing to ensure absence of any damage, defects and deterioration
	2.4	Fixed electrical wiring is tested, as required, and results are documented to confirm compliance with job specification
3 Test electrical equipment	**3.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures site requirements
	3.2	Electrical equipment is tested using appropriate plans, drawings and manuals, in accordance with workplace procedures
	3.3	Test conditions are confirmed, and equipment is inspected, in accordance with workplace procedures, to ensure absence of damage, defects and deterioration
	3.4	Electrical equipment is tested using appropriate testing techniques, in accordance with workplace procedures
	3.5	Electrical equipment test results are documented to confirm compliance with job specification
4 Commission electrical equipment	**4.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures and site requirements
	4.2	Electrical equipment is commissioned using appropriate plans, drawings and manuals, in accordance with workplace procedures
	4.3	Equipment is set up, in accordance with workplace procedures, operational requirements or manufacturers' specifications

© Commonwealth of Australia, 2025 Powering Skills Organisation

	4.4	Testing and monitoring procedures are followed, and results are documented to ensure electrical equipment functions within manufacturers' specifications
	4.5	Electrical equipment is commissioned, in accordance with workplace procedures
	4.6	Final inspection on electrical equipment is carried out, in accordance with workplace procedures
5 Complete work	**5.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	5.2	Work area is cleared of waste, cleaned, restored and secured in accordance with workplace procedures
	5.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	5.4	Work completion details are finalised, in accordance with workplace procedures

UEPMNT355 Install complex electronic instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the installation of complex electronic instrumentation equipment used in multi-loop configurations including, but not limited to, totaliser units, laboratory and field analysers and signal characterising, microprocessor control, interface, ultrasonic and nucleonic equipment.

Installation of complex electronic instrumentation equipment in a power generation facility is typically performed in conjunction with manufacturers' specifications to ensure serviceability and reliability.

Competency in this unit requires the ability to plan work, install complex electronic instrumentation equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT356 Maintain instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the maintenance of instrumentation equipment including, but not limited to, process measurement, control and analytical instrumentation.

Instrumentation equipment measures, monitors or controls flows, temperature, levels or pressure and typically forms part of the control system in a power generation facility. Maintenance is an essential part of the ongoing care and upkeep required to ensure all instrumentation equipment is operationally efficient.

Competency in this unit requires the ability to plan work, maintain instrumentation equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

  - hazard identification
  - risk control measures
  - safe working practices
  - using emergency procedures
- carrying out maintenance on instrumentation equipment
- communicating with personnel
- completing work as per scheduled requirements
- determining permit to work requirements
- identifying and selecting materials
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- maintaining instrumentation equipment using maintenance and calibration techniques and procedures
- performing with testing and measurement instruments
- planning for instrumentation equipment maintenance work
- utilising tools and equipment
- working with data analysis techniques and tools

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- equipment and materials
- installing electronic instrumentation equipment
- instrument installation practices

© Commonwealth of Australia, 2025 Powering Skills Organisation

- isolations
- legislation, industry standards, codes of practice and regulations
- maintenance and instrument calibration techniques
- manufacturers' specifications and manuals
- permit to work system
- test and measurement instruments
- types of instrumentation equipment
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - hazard identification
  - risk control measures
  - safe working practices
  - using emergency procedures
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions. Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT357 Diagnose and repair faults in instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to diagnose and repair instrumentation equipment, including, but not limited to, sensor elements, signal characterising equipment, input and output blocks, controllers, transducers and final elements.

A fault is defined as an abnormal condition or defect at the component, equipment or system level which may lead to a failure. Diagnosing and repairing faults ensures the smooth and efficient operation of all instrumentation equipment in a power generation facility.

Competency in this unit requires the ability to plan work, find and verify instrumentation equipment faults, determine cause and then repair faults in instrumentation equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEENEEI001B Install and set up transducers and sensing devices

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

Competency Field

Maintenance

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance, in accordance with workplace procedures and job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace and site procedures
2 Diagnose and verify faults	**2.1** Normal performance and function of instrumentation equipment is ascertained using manufacturers' manuals and industry standards, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.2	Fault indicators, technical information and diagnostic techniques are used to verify reported faults, in accordance with workplace procedures
	2.3	Faults are reproduced and monitored, in accordance with workplace procedures
3 Find faults	**3.1**	Isolations for work are confirmed, where appropriate, in accordance with workplace procedures and site requirements
	3.2	Instrumentation equipment components, wires, cables, terminations and support fixings are inspected for faults, in accordance with workplace procedures
	3.3	Diagnostic techniques are selected and used to determine faults, in accordance with workplace procedures
	3.4	Components are disconnected, to enable accurate test measurements of suspected faulty components without the concern of back feed readings, in accordance with workplace procedures
	3.5	Test and measurement instruments are used, in accordance with workplace procedures, manufacturers' specifications and job requirements
4 Determine cause of faults	**4.1**	Appropriate personnel are consulted on faulty equipment, in accordance with workplace procedures
	4.2	Information from fault indicators and maintenance records are used, in accordance with workplace procedures
	4.3	Conclusions about the nature and cause of the fault are determined from an analysis of the evidence, in accordance with workplace procedures
5 Repair faults	**5.1**	Isolations for work are confirmed, in accordance with workplace procedures and site requirements
	5.2	Faulty components are replaced or repaired, in accordance with manufacturers' specifications and workplace procedures
	5.3	Components disconnected for testing are reconnected, and all terminations are checked to ensure they are electrically and mechanically sound, in accordance with

© Commonwealth of Australia, 2025 Powering Skills Organisation

		workplace procedures
	5.4	All faults are repaired, in accordance with workplace procedures
	5.5	Final inspection is performed, in accordance with workplace procedures
6 Complete work	**6.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	6.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	6.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	6.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT357B Diagnose and repair faults in instrumentation equipment.

Assessment Requirements for UEPMNT357 Diagnose and repair faults in instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled requirements
- determining cause of instrumentation equipment fault
- determining permit to work requirements
- diagnosing and repairing faults in instrumentation equipment
- finding instrumentation equipment fault using fault finding and diagnostic techniques
- identifying and selecting materials
- implementing regulations, legislation, industry standards and codes of practice
- interpreting manufacturers' specifications and manuals
- planning for diagnosis and fault repair of instrumentation equipment work
- repairing instrumentation equipment fault
- using tools and equipment
- verifying instrumentation equipment fault using data analysis techniques and tools
- working with test and measurement instruments

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- diagnosing and repairing faults in instrumentation equipment

© Commonwealth of Australia, 2025 Powering Skills Organisation

- diagnostic and fault finding techniques and procedures
- equipment and materials
- instrument calibration techniques
- instrumentation equipment
- isolations
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- plant and equipment and its location
- repair and verification techniques
- test and measurement instruments
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPMNT358 Modify instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct modifications of instrumentation equipment, including but not limited to sensor elements, signal characterising equipment, input and output blocks, controllers, transducers and final elements.

Modifications to instrumentation equipment, that forms part of the control system in a power generation facility, includes any changes which may alter it from the manufacturers' specifications.

Competency in this unit requires the ability to plan work, carry out modifications of instrumentation equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT359 Test and commission instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct testing and commissioning of instrumentation equipment including, but not limited to, sensor elements, signal characterising equipment, input and output blocks, controllers, transducers and final elements.

Commissioning and testing is the process of ensuring that all instrumentation equipment, that forms part of the control system in a power generation facility, is working according to operational requirements.

Competency in this unit requires the ability to plan work, testing wiring systems, testing piping and tubing systems, testing instrumentation equipment, commissioning instrumental equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. UEPMNT366 Maintain power plant inverter systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the maintenance of power generation plant inverter systems.

Maintenance includes the regular monitoring, inspection and verification of the safe and efficient operation of a power generation facility's inverter system.

Competency in this unit requires the ability to plan work, carry out inverter system maintenance and complete all work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practices

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

UEENEEG063A Arrange circuits, control and protection for general electrical installations

UEENEEG101A Solve problems in electromagnetic devices and related circuits

UEENEEG102A Solve problems in low voltage A.C. circuits

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

  - emergency procedures
  - potential hazards
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions. Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT367 Install and commission stationary gas fuelled reciprocating engines

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the installation and commissioning of stationary gas fuelled reciprocating engines.

Installation and commissioning is a key feature of placing stationary gas fuelled reciprocating engines into service. Completing installation and commissioning correctly ensures the reliability of stationary gas fuelled reciprocating engines for its service life.

Competency in this unit requires the ability to work safely to installation standards matching the plant or equipment, location, components and fuel train pipe work relevant to given specifications. Commissioning plant and equipment includes performing precommissioning tests, start ups and adjusting components and controls for safe and efficient operation. It also includes completing all necessary installation and commissioning documentation. Individuals will, in general, work as a maintenance operative, in a power generation facility.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practices

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

CPCCWHS1001 Work safely in the construction industry

HLTAID001 Provide cardiopulmonary resuscitation.

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare to install and commission stationary gas fuelled reciprocating engine	**1.1** Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations are obtained and implemented, in accordance with workplace procedures
	1.2 Health and safety risks are identified and risk control measures are followed, in accordance with workplace procedures
	1.3 Safety hazards that have not previously been identified are noted and risk control measures are implemented, in accordance with workplace procedures
	1.4 Design specification for gas fuelled reciprocating engines to be installed and commissioned are accessed, analysed and confirmed through a detailed site inspection
	1.5 Design specification matters requiring clarification are resolved through liaison with designer and gas authorities
	1.6 Formal authority to proceed with installation and commissioning of stationary gas fuelled reciprocating engine is obtained before commencing work, in accordance with workplace procedures, regulatory and code of practice requirements
	1.7 Installation is prepared and is sequenced, in accordance with workplace procedures and quality assurance requirements
	1.8 Nature and location of the installation and commissioning of the stationary gas fuelled reciprocating engine is determined from documentation or appropriate personnel to establish scope of work and assigned roles to be undertaken

© Commonwealth of Australia, 2025 Powering Skills Organisation

	1.9 Stationary gas fuelled reciprocating engine plant, equipment component specifications and manufacturers' manuals are obtained
	1.10 Plant, equipment, fuel train pipe work and components are identified and locations are sequenced within the constraints of site and work requirements
	1.11 Materials needed for installation are obtained, in accordance with workplace procedures and design specifications
	1.12 Tools and equipment including personal protective equipment and testing devices are obtained, in accordance with workplace procedures and are checked for correct operation and safety
	1.13 Work area is prepared to support installation and commissioning of gas fuelled reciprocating engine plant and equipment
2 Install stationary gas fuelled reciprocating engine	**2.1** Regulatory and code of practice recording and reporting requirements are satisfied throughout work sequence, in accordance with workplace procedures
	2.2 Gas and electrical circuits, machines and plant are checked as being isolated, in accordance with workplace procedures
	2.3 Stationary gas fuelled reciprocating engine components including fuel train, associated pipe work and flue/exhaust systems are installed, in accordance with workplace procedures, design specifications, technical standards and regulatory requirements
	2.4 Ventilation systems are installed, in accordance with workplace procedures and design specifications
	2.5 Electrical components, wiring enclosures and terminations are installed, in accordance with workplace procedures, design and manufacturers' specifications and regulatory requirements
	2.6 Ongoing compliance and safety inspections of installed gas fuelled reciprocating engine, equipment, pipe work, components and accessories is undertaken and identified defects are rectified
	2.7 Stationary gas fuelled reciprocating engine installation is

© Commonwealth of Australia, 2025 Powering Skills Organisation

		carried out without waste of materials or damage to plant, equipment, pipe work, components, accessories, the surrounding environment or services using workplace identified sustainable energy principles and practices
	2.8	Unexpected situations are dealt with safely, in accordance with workplace procedures and the approval of authorised personnel
3 Commission stationary gas fuelled reciprocating engine	**3.1**	Gas and electrical safety checks and isolation procedures, including purging are completed and recorded to manufacturers' and regulatory requirements before testing and commissioning are commenced
	3.2	Operational parameters of individual components are tested and adjusted to conform to manufacturers' specifications
	3.3	Reciprocating engine operations are tested, first without, and then with fuel, and adjustments are completed, as required, with results recorded in accordance with workplace procedures and approving authority requirements
	3.4	Exhaust gases are analysed, in accordance with workplace procedures, industry practice and regulatory requirements
	3.5	Commissioning of stationary gas fuelled reciprocating engine is conducted without waste of materials or damage to apparatus and the surrounding environment or services using workplace sustainable energy procedures and practices
4 Completion and report installation and commissioning activities	**4.1**	Final check of installed gas fuelled reciprocating engine is made to verify compliance with regulatory and certification requirements
	4.2	Work area is cleared and materials are disposed of or are recycled, in accordance with legislation and workplace procedures
	4.3	Tools and equipment are cleaned, checked, serviced and stored, in accordance with manufacturers' recommendations and workplace procedures
	4.4	Work site is cleaned and made safe, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

4.5	Installed reciprocating engine equipment components, pipe work, flue, exhaust systems and accessories are documented and appropriate personnel are notified, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT367A Install and commission stationary gas fuelled reciprocating engines.

Assessment Requirements for UEPMNT367 Install and commission stationary gas fuelled reciprocating engines

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - hazard identification
  - identifying hazards
  - risk control measures
  - safe working practices
- commissioning stationary gas fuelled reciprocating engine
- communicating with personnel
- completing and reporting on installation and commissioning activities
- completing documentation
- determining permit to work requirements
- identifying safety and/or site arrangements including hazardous area requirements
- implementing legislation, industry standards, codes of practice and regulations
- installing stationary gas fuelled reciprocating engine
- interpreting technical and plans drawings related to plant and/or equipment locations and pipe work connections
- obtaining formal authority to proceed with installation and commissioning
- preparing to install and commission stationary gas fuelled reciprocating engines
- recording results from testing
- rectifying defects using tools and equipment
- securing, aligning and connecting plant, equipment, pipe work, components and accessories accurately
- testing pressure, repairing leaks and purging fuel train system to design test pressures
- undertaking compliance and safety inspections
- using manufacturers' specifications and manuals

© Commonwealth of Australia, 2025 Powering Skills Organisation

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- commission and installation processes
- compliance and safety inspections
- documentation and reports
- gas fuelled reciprocating engine types and characteristics
- gas fuels
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- potential defects
- pressure testing, repairing leaks and purging fuel train system to design test pressures
- safety and/or site arrangements including hazardous area requirements
- securement, alignment and connection of plant, equipment, pipe work, components and accessories
- stationary gas fuelled reciprocating engine plant and equipment drawings and plans
- tools and equipment
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPMNT368 Repair and maintain stationary gas fuelled reciprocating engines

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to isolate, disconnect, repair, reconnect and undertake maintenance of stationary gas fuelled reciprocating engines. It does not include repairs to the internal mechanical components of the engine.

Maintenance includes the regular monitoring, inspection and verification of the safe and efficient operation of a power generation facility's stationary gas fuelled reciprocating engine.

Competency in this unit requires the ability to work safely to relevant industry standards when disconnecting, carrying out repairs and replacing fuel train components to given specifications. It also includes reconnecting the engine including pre-start tests, start-up, adjusting components and controls for safe and efficient operation and completing all required documentation. Individuals will, in general, work as a maintenance operative, in a power generation facility.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practices

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

engines		workplace procedures
	2.2	Gas and electrical circuits, machines and/or power generation plant are checked prior to commencement and are recorded as being isolated and safe, in accordance with workplace procedures
	2.3	Nature and possible cause of stationary gas fuelled reciprocating engine faults, or out of specification performance, are identified from defect reports or operational records
	2.4	Fault finding using observation, measurement, calculations, comparison with normal system and component parameter values is undertaken
	2.5	Faults beyond the scope of gas fuel train, ignition or fume exhaust work are identified and arrangements are made for authorised personnel to rectify faults
	2.6	Stationary gas fuelled reciprocating engine is disconnected, to carry out maintenance and repairs, in accordance with workplace procedures
	2.7	Components are removed or dismantled, where necessary, and parts are stored to protect them against loss or damage
	2.8	Faulty components are rechecked and their fault status is reconfirmed
	2.9	Materials required to rectify faults are obtained, in accordance with workplace procedures
	2.10	Repair and maintenance work is carried out without waste of materials or damage to apparatus, circuits, the surrounding environment or services, in accordance with workplace procedures and sustainable energy principles and practices
	2.11	Stationary gas fuelled reciprocating engine repair is tested, in accordance with workplace procedures
	2.12	Stationary gas fuelled reciprocating engine is reassembled, reconnected and tested to ensure it is operating safely and that it complies with relevant workplace and legislative requirements
3 Complete and report on	**3.1**	Final check of stationary gas fuelled reciprocating engine is made to verify compliance with legislative and

UEPMNT369 Monitor climatic conditions for renewable electricity generation

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to monitor weather and climate conditions for the purposes of planning electricity generation from renewable sources and ensuring the safety of power generation plant and personnel.

Weather is measured through the assessment of patterns in temperature, humidity, atmospheric pressure, wind, precipitation and other meteorological variables. Climate is the measurement of weather over longer periods of time in specific regions.

Competency in this unit requires the ability to interpret weather and climate information, plan for adverse or extreme weather conditions, take action in response to adverse or extreme weather conditions and complete all documentation. Individuals will, in general, work as a maintenance operative in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practices

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Interpret weather and climate information	**1.1** Weather, climate information and warnings are regularly monitored to determine likely conditions
	1.2 Potential variations in weather and climate conditions are assessed, in accordance with warnings, weather patterns and historical experience
	1.3 Possible impact of weather and climate on power generation plant, equipment, grid demand and civil assets are identified
2 Plan for adverse weather conditions	**2.1** Workplace operational guidelines for adverse weather conditions are accessed and implemented, in accordance with workplace procedures
	2.2 Possible power generation outages and actions to be taken are communicated to key stakeholders
3 Act in response to adverse weather conditions	**3.1** Work schedules are adjusted, in accordance with workplace procedures, to account for extreme weather events
	3.2 Workplace procedures to be followed during, and after, extreme weather events are analysed and discussed with personnel or team members
	3.3 External assets in the perimeter area of wind turbine generators are prepared, in accordance with workplace procedures, for extreme weather events
	3.4 Emergency and evacuation procedures are implemented, in accordance with workplace procedures for adverse weather conditions
	3.5 Stakeholders and key personnel are informed of anticipated impact of weather and climate on power generation plant, equipment, grid demand and civil assets
	3.6 Meteorological incidents are monitored and preventative actions are taken

© Commonwealth of Australia, 2025 Powering Skills Organisation

	3.7	Normal operations are recommenced, in accordance with workplace procedures, after confirmation of return to normal weather conditions and completion of inspection
4 Complete documentation	**4.1**	Workplace documentation is updated, in accordance with workplace procedures
	4.2	Reports are prepared and presented to key personnel, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

UEPMNT370 Maintain and monitor wind farm civil assets

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to condition, monitor and conduct preventative and remedial maintenance to ensure the integrity of civil assets associated with a wind farm.

Civil assets include infrastructure such as water treatment facilities, sewer pipelines, roads, utility grids, bridges, tunnels and railways. Maintenance involves the use of strategies and procedures to preserve and extend the service life of civil asset infrastructure at a wind farm.

Competency in this unit requires the ability to plan work, disassemble wind turbine, inspect wind turbine components, repair wind turbine and/or components and report on all completed work tasks. Individuals will, in general, work under supervision in a maintenance operative in a power generation facility.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Assessment Requirements for UEPMNT370 Maintain and monitor wind farm civil assets

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work
- confirming security systems operation
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- maintaining and repairing civil assets including:
  - confirming security system operation
  - performing corrosion restoration and painting of metal surfaces
  - placing pest control baits in a safe and environmentally aware manner
  - undertaking surveys of lighting systems and replacing defective bulbs
  - using brush cutters and mowers to reduce vegetation form the perimeter of buildings and/or structures
- monitoring civil assets
- performing corrosion restoration and painting of metal surfaces
- placing pest control baits in a safe and environmentally aware manner
- planning for maintenance and monitoring of wind farm civil assets work
- undertaking surveys of lighting systems and replacing defective bulbs
- using brush cutters and mowers to reduce vegetation from the perimeter of buildings or structures
  -

UEPMNT371 Maintain large scale wind turbine generators

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake scheduled maintenance of large scale wind turbine generators.

Scheduled maintenance typically includes a list of predetermined maintenance actions carried out at regular time intervals to prevent breakdowns. It includes monitoring, inspecting and maintaining large scale wind turbine generators to ensure their safe and efficient operation.

Competency in this unit requires the ability to plan work, conduct maintenance and complete all work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Maintenance

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.6 Isolations for work are requested, in accordance with workplace procedures
	1.7 Work area is prepared, in accordance with workplace procedures
2 Conduct maintenance	**2.1** Wind turbine generator equipment is replaced, in accordance with manufacturers' specifications and workplace procedures
	2.2 Documented service checklists, or similar documentation, are followed, in accordance with workplace procedures
	2.3 Diagnostic testing and data from monitoring systems are used to identify wind turbine generator components requiring maintenance
	2.4 Wind turbine generator equipment is dismantled for maintenance, in accordance with manufacturers' specifications and workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.5	Approved workplace techniques are used to enable identification or reassembly of components or equipment, in accordance with workplace procedures
	2.6	New components are obtained and inspected, in accordance with workplace procedures, for compliance with manufacturers' specifications
	2.7	Wind turbine generator equipment or components are tested, monitored and adjusted, in accordance with manufacturers' specifications and workplace procedures
3 Complete work	**3.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	3.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	3.3	Tools and equipment are maintained and stored, in accordance with workplace procedures
	3.4	Maintenance completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT371A Maintain large scale wind turbine generators.

Assessment Requirements for UEPMNT371 Maintain large scale wind turbine generators

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices including working in high wind velocity
- assembling and dismantling wind turbine generator equipment and components
- communicating with personnel
- completing documentation after maintenance activities
- completing work as per scheduled requirements
- conducting diagnostic testing using which may include use of a diagnostic computer
- conducting maintenance
- determining permit to work requirements
- identifying faults in wind turbine generator equipment and components
- implementing legislation, industry standards, codes of practice and regulations
- interpreting data
- planning for maintenance of large scale wind turbine generator work
- reading maintenance schedules and service checklists
- using manufacturers' specifications and manuals

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals

© Commonwealth of Australia, 2025 Powering Skills Organisation

- permit to work system
- safe working practices including working in high wind velocity
- typical arrangements of, power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
- wind turbine generator plant and equipment, its location and operating parameters
- wind turbine generator plant status
- wind turbine generator, types and characteristics
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT401 Install and maintain complex mechanical seals

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the installation and maintenance of complex mechanical seals which may involve fault finding, diagnosis and repair.

Installation of mechanical seals, which are leakage control devices used in power generation plant and equipment, is typically performed in conjunction with manufacturers' specifications to ensure serviceability and reliability. Maintenance ensures the ongoing care and upkeep of the seals to ensure optimal efficiency.

Competency in this unit requires the ability to plan work, remove complex mechanical seals for maintenance, maintain complex mechanical seals, replace and/or install complex mechanical seals and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT402 Conduct complex levelling and alignment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct levelling and the advanced alignment of power generation plant and machinery, this may include high speed rotating plant.

Levelling is the process in which differences in height between two or more points are determined. Alignment is placing or arranging in a straight line, this can include adjusting parts of a mechanism to produce a required relationship or orientation.

Competency in this unit requires the ability to plan and prepare work, perform alignments and complete all work tasks. Individuals will, in general, work as a maintenance operative in a power generation facility.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

MEM18009B Perform levelling and alignment of machines and engineering components

MEM09002B Interpret technical drawing

UEPMNT403 Maintain complex mechanical valves

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake fault finding, diagnosis, repair or overhaul of complex mechanical valves, excluding associated servo or actuating units.

A fault is defined as an abnormal condition or defect of a mechanical valve which may lead to a failure in power generation facility equipment, systems and/or plant. Diagnosis and repair requires the identification of the type of fault, its cause and the determination of repair actions.

Competency in this unit requires the ability to plan work, remove mechanical valves for maintenance, perform mechanical valve maintenance, replace and/or install valves and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT404 Maintain complex mechanical pumps

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the maintenance of complex mechanical pumps which may include multi-stage centrifugal pumps, axial flow compressors, fans and blowers.

Maintenance is the process of regularly monitoring, inspecting and maintaining complex mechanical pumps in a power generation facility to ensure optimal performance.

Competency in this unit requires the ability to plan work, remove complex mechanical pumps for maintenance, maintain complex mechanical pumps, replace or install complex mechanical pumps and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT304 Maintain mechanical pumps

MEM18006C Repair and fit engineering components

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigning roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturer specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Remove complex mechanical pumps for	**2.1** Isolations for work are confirmed, in accordance with

© Commonwealth of Australia, 2025 Powering Skills Organisation

maintenance		workplace procedures
	2.2	Complex mechanical pump is disconnected, in accordance with workplace procedures
	2.3	Complex mechanical pump is removed, in accordance with workplace procedures
	2.4	Complex mechanical pump is inspected for abnormalities, in accordance with workplace procedures
3 Maintain complex mechanical pumps	**3.1**	Maintenance is performed on complex mechanical pump, in accordance with workplace procedures and manufacturers' specifications
	3.2	Complex mechanical pump is dismantled for maintenance, in accordance with workplace procedures and manufacturers' specifications
	3.3	Sketches are made, data noted and components marked for identification or reassembly, in accordance with workplace procedures
	3.4	New components are inspected, in accordance with workplace procedures, for compliance with manufacturers' specifications
	3.5	Dimensional inspection is performed with precision measuring devices, in accordance with workplace procedures, to ensure compliance with manufactures' specifications and results are recorded
	3.6	Complex mechanical pump is reassembled, using industry principles and approved techniques, in accordance with workplace procedures and manufacturers' specifications
	3.7	Modifications or alterations are undertaken, in accordance with workplace procedures
4 Replace or install complex mechanical pumps	**4.1**	Equipment and plant is prepared for complex mechanical pump replacement, in accordance with workplace procedures
	4.2	Complex mechanical pump is replaced, in accordance with workplace procedures and manufacturers' specifications
	4.3	Complex mechanical pump is levelled, aligned, coupled and connected, in accordance with workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

		procedures
	4.4	All fastenings are torqued, in accordance with workplace procedures and manufacturers' specifications
	4.5	Machinery, plant and pump are given a test run, then monitored and adjusted, as required, in accordance with workplace procedures and manufacturers' specifications
5 Complete work	**5.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	5.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	5.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	5.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT404B Maintain complex mechanical pumps.

Assessment Requirements for UEPMNT404 Maintain complex mechanical pumps

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing using data analysis techniques
- applying Work, Health and Safety(WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled requirements
- determining permit to work requirements
- dismantling and reassembling techniques for maintaining complex mechanical valves
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- levelling and aligning with approved techniques
- maintaining complex mechanical pumps using maintenance techniques and procedures
- operating with torque techniques
- planning for maintenance of complex mechanical pump work
- reading technical drawings and data
- recognising worn or damaged components
- removing complex mechanical pumps for maintenance using removal techniques
- replacing or installing complex mechanical pumps using installation techniques and procedures
- selecting materials and components
- testing using diagnostic and testing techniques
- undertaking isolations and torqueing
- using tools
- utilising precision measuring equipment
- working with and applying fluid dynamics principles

© Commonwealth of Australia, 2025 Powering Skills Organisation

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- analysis and data recording techniques
- diagnostic and testing techniques
- fluid dynamics
- isolations
- legislation, industry standards, codes of practice and regulations
- level and alignment techniques
- maintenance of complex mechanical pumps generation plant and equipment, its location and operation
- manufacturers' specifications and manuals
- materials and components of pumps
- permit to work system
- precision measuring equipment
- technical drawings and data
- tools
- torque techniques
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - hazard identification
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions. Resources for assessment must include access to:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT408 Install hydro turbines

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to install hydro turbines. The installation of a hydro turbine refers to a hydro turbine being removed from service, for repair and overhaul.

Installation is a key feature of placing hydro turbines into service, it can include conducting repairs and/or the overhaul of a hydro turbine to ensure reliability of operation during its service life.

Competency in this unit requires the ability to plan work, disassemble a hydro turbine, inspect hydro turbine's components, repair a hydro turbine and/or its' components and to report on all completed work tasks. Individuals will, in general, work under supervision as a maintenance operative in a power generation facility.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT402 Conduct complex levelling and alignment

MEM18009B Perform levelling and alignment of machines and engineering components

MEM09002B Interpret technical drawing

MEM12023A Perform engineering measurements

MEM18001C Use hand tools

MEM18002B Use power tools/hand held operations

MEM18003C Use tools for precision work

MEM18055B Dismantle, replace and assemble engineering components

MEM18006C Repair and fit engineering components

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Disassemble hydro turbine	**2.1** Isolations for work are confirmed, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.2	Hydro turbine is disassembled, in accordance with manufacturers' specifications and workplace procedures
	2.3	Hydro turbine components are removed in priority order, in accordance with manufacturers' specification and workplace procedures
	2.4	Disassembly is carried out to facilitate reassembly, in accordance with workplace procedures
	2.5	Components are measured and clearances are taken, in accordance with workplace procedures, to determine conformity to manufacturer’s limits and to ensure assembly meets manufacturers' specifications
	2.6	Measurements and clearances are recorded, in accordance with manufacturer' specifications and workplace procedures
3 Inspect hydro turbine components	**3.1**	Components are cleaned and inspected, in accordance with workplace procedures
	3.2	Faults are identified and recorded, in accordance with workplace procedures
	3.3	New components are inspected for compliance to manufacturers' specifications, in accordance with workplace procedures
	3.4	Components are prepared for assembly, in accordance with workplace procedures
4 Repair hydro turbine or components	**4.1**	Repairs are carried out, in accordance with workplace procedures
	4.2	Repairs are tested and results are analysed to ensure conformance to manufactures' specifications, in accordance with workplace procedures
	4.3	Data from testing is recorded, in accordance with workplace procedures
5 Reassemble hydro turbine	**5.1**	Equipment and plant is prepared for reassembly of hydro turbine, in accordance with workplace procedures.
	5.2	Isolations are confirmed, in accordance with workplace procedures
	5.3	Components are refitted, in accordance with workplace

UEPMNT410 Diagnose and repair faults in electronic equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to diagnose and repair faults in electronic equipment at board and component level; this may involve work to be carried out with equipment on line.

Diagnosing and repairing includes the inspection, testing and verification of the operation and reliability of electronic equipment including components, wires, cables, boards, terminations and support fixings used in a power generation facility.

Competency in this unit requires the ability to plan work, diagnose electronic equipment faults, find electronic equipment faults, determine cause of electronic equipment faults, repair electronic equipment faults and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

UEPMNT411 Diagnose and repair faults in complex electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to diagnose and repair faults in complex and High Voltage (H.V.) electrical equipment, this may involve work being carried out with equipment online.

Diagnosing and repairing faults includes the inspection, testing and verification of the operation and reliability of complex and H.V. electrical equipment used in a power generation facility.

Competency in this unit requires the ability to plan work, verify complex electrical equipment faults, find complex electrical equipment faults, determine cause of complex electrical equipment fault, repair complex electrical equipment fault and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Assessment Requirements for UEPMNT411 Diagnose and repair faults in complex electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
- communicating with personnel
- completing work as per scheduled requirements
- determining permit to work requirements
- implementing regulations, industry standards, codes of practice and legislation
- planning diagnosis and repair of faults in complex electrical equipment work
- repairing faults using repair techniques
- safe working practices using diagnostic and fault finding techniques and procedures
- selecting materials and resources
- using manufacturers' specifications and manuals
- utilising testing and measurement instruments
- verifying and identifying faults
- working with tools and equipment

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- diagnosis and repair of faults in complex electrical equipment
- fault finding and diagnostic methods and techniques
- isolations
- legislation, industry standards, codes of practice and regulations

© Commonwealth of Australia, 2025 Powering Skills Organisation

- manufacturers' specifications and manuals
- materials to use in diagnosing and repairing complex electrical equipment
- permit to work system
- power generation plant and equipment, its location and operation
- repair methods and techniques
- test and measurement instruments
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions. Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT412 Modify complex electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake modifications of complex and High Voltage (H.V.) electrical equipment; this may include but is not limited to alterations, additions or adjustments.

Modifications are any changes to complex electrical equipment which may alter it from the manufacturers' specification, it can include alterations, additions or adjustments to complex and High Voltage (H.V.) electrical equipment to ensure they meet operational requirements.

Competency in this unit requires the ability to plan work, carry out complex electrical equipment modifications and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or onsite.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT350 Modify electrical equipment

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

© Commonwealth of Australia, 2025 Powering Skills Organisation

UEENEEG063A Arrange circuits, control and protection for general electrical installations

UEENEEG101A Solve problems in electromagnetic devices and related circuits

UEENEEG102A Solve problems in low voltage A.C. circuits

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

Competency Field

Maintenance

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) standards, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control

© Commonwealth of Australia, 2025 Powering Skills Organisation

		measures are selected and implemented, in accordance with workplace procedures
	1.8	Work area is prepared, in accordance with workplace procedures
2 Carry out modifications	**2.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures
	2.2	Complex electrical equipment is modified, in accordance with workplace procedures, plans, drawings and manuals
	2.3	Modifications are completed, in accordance with workplace procedures, without loss or damage to equipment
	2.4	Modified equipment is set up, in accordance with workplace procedures and manufacturers' specifications
	2.5	Final inspection is performed, in accordance with workplace procedures
3 Complete work	**3.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	3.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	3.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	3.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

UEPMNT414 Test and commission complex electrical equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct testing and commissioning of complex and High Voltage (H.V.) electrical wiring systems and equipment.

Commissioning and testing is the process of ensuring all systems and components of complex and High Voltage (H.V.) electrical wiring systems and equipment used within a power generation facility are working efficiently and safely according to operational requirements.

Competency in this unit requires the ability to plan work, test wiring systems in complex electrical equipment, test complex electrical equipment, commission complex electrical equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT351 Test and commission electrical equipment

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEPMNT417 Inspect electrical generators and diagnose faults

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct inspections and diagnose faults in electrical generators.

An inspection is a critical appraisal involving the examination, measurement, testing, gauging, and comparison of electrical generator components and parts. An inspection will determine if an electrical generator is in a safe and reliable working condition and if it conforms to the manufactures' specifications.

Competency in this unit requires the ability to plan work, carry out electrical generator inspections, evaluate and analyse inspection results, prepare remedial action plans and update documentation. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT351 Test and commission electrical equipment

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEPMNT419 Perform civil drafting

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to perform civil drafting and to use drawing equipment for the production of sectional, schematic and plan drawings.

Drafting is the creation of a technical drawing, schematic or plan of a mechanical device or structure for the purpose of determining how they have been created or works. Drafting can be completed by hand or with specially designed computer programs.

Competency in this unit requires the ability to prepare for drafting, perform civil drafting and complete work tasks. Individuals will, in general, work as a maintenance operative in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

MEM09002B Interpret technical drawing

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare for drafting	**1.1** Requirements including scope of work are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
2 Perform drafting	**2.1** Civil structures and their assembly are drawn using sectional representations, in accordance with specification requirements
	2.2 Civil structures are drawn to highlight critical features, in accordance workplace procedures and manufacturers' specifications
	2.3 Progressive tolerance calculations are performed, in accordance with workplace procedures, to ensure functional operation of civil structures
	2.4 Dimensions are selected to ensure fit of civil components, in accordance with specification requirements
	2.5 Civil components are selected from manufacturers' catalogue, in accordance with workplace procedures, to meet specified functions
	2.6 Pictorial drawings such as isometrics are produced, as requested, in accordance with workplace procedures and industry standards
3 Complete work	**3.1** Drawings are checked to ensure that civil structure assembly is possible, in accordance with specification requirements
	3.2 Drawings are produced, registered and recorded, in

© Commonwealth of Australia, 2025 Powering Skills Organisation

accordance with workplace documentation procedures

3.3 Relevant personnel are notified, and existing drawings and specification sheets are updated, as required

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT419B Perform civil drafting.

Assessment Requirements for UEPMNT419 Perform civil drafting

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled requirements
- implementing legislation, industry standards, codes of practice and regulations
- performing drafting of civil structures
- preparing for drafting
- using technical drawings, plans, manufacturers' specifications and manuals
- utilising drafting principles including using civil drawing symbols
- working with computer aided drawing systems and equipment

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- civil drawing symbols
- concepts and principles of drafting
- equipment for drawing and computer aided drawing systems
- legislation, industry standards, codes of practice and regulations
- technical drawings, plans, manufacturers' specifications and manuals
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:

© Commonwealth of Australia, 2025 Powering Skills Organisation

  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT421 Conduct technical inspection of process plant and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct a technical inspection of process generation plant, equipment and associated infrastructure.

An inspection is an organised examination or formal evaluation of power generation plant and equipment, it includes verifying compliance with technical specifications, taking measurements and performing tests.

Competency in this unit requires the ability to prepare for an inspection of power generation plant, inspection of power generation plant, analysing inspection results and updating documentation. Individuals will, in general, work as a maintenance operative in a power generation facility.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT351 Test and commission electrical equipment

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and

© Commonwealth of Australia, 2025 Powering Skills Organisation

circuits

UEENEEG063A Arrange circuits, control and protection for general electrical installations

UEENEEG101A Solve problems in electromagnetic devices and related circuits

UEENEEG102A Solve problems in low voltage A.C. circuits

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

Competency Field

Maintenance

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare for inspection process plant	**1.1** Short term maintenance and operating history is identified and obtained from authorised personnel
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications and workplace procedures are reviewed in preparation for work
	1.3 Deviations from normal operational parameters of process plant, equipment and associated infrastructure are identified
	1.4 Potential options for cause of deviations are established, in accordance with workplace procedures
	1.5 Needs and outcomes of process plant inspections or testing are defined, in accordance with workplace procedures
	1.6 Method sheets, check sheets and isolation instructions are obtained, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	1.7	Technical procedures are reviewed and adapted, as required, in accordance with workplace procedures
2 Inspect process plant	**2.1**	Process plant is correctly identified, in accordance with workplace procedures
	2.2	Process plant's operational status is identified, in accordance with workplace procedures
	2.3	Inspection work is carried out, in accordance with workplace procedures, legislative requirements and industry standards
	2.4	Inspection methods are followed, in accordance with workplace procedures
	2.5	Relevant documentation is completed, in accordance with workplace procedures
	2.6	Additional tests or inspections are identified, in accordance with workplace procedures
	2.7	Process plant and/or equipment is left in a safe condition, in accordance with workplace procedures
	2.8	Process plant and/or equipment availability is declared, in accordance with workplace procedures
	2.9	Specialist assistance is sought, in accordance with workplace procedures, during a technical inspection
3 Analyse inspection results	**3.1**	Testing and inspection results are analysed
	3.2	Causes for deviations from normal operation are identified
4 Prepare remedial action plan	**4.1**	Action plan is prepared for any required remedial action on process plant, equipment and associated infrastructure
	4.2	Remedial action is checked for implementation effectiveness, in accordance with workplace procedures
5 Update documentation	**5.1**	Records and documentation is updated, in accordance with legislative requirements, industry standards and workplace procedures
	5.2	Testing and inspection results, including reports are forwarded to designated personnel

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT421B Conduct technical inspection of process plant and equipment.

Assessment Requirements for UEPMNT421 Conduct technical inspection of process plant and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing inspection results
- analysing with data analysis techniques and tools
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- comparing components against drawings, manuals and modules
- determining power generation operating parameters and process plant status
- identifying abnormal power generation plant operating conditions including process plant
- implementing legislation, industry standards, codes of practice and regulations
- inspecting process plant
- locating process plant and equipment at worksite
- meeting permit to work requirements
- organising a remedial action plan
- preparing for inspection
- recognising worn, damaged or seized components
- updating documentation using recording procedures
- using manufacturers' specifications and manuals
- utilising testing and inspection techniques
- working with Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes

© Commonwealth of Australia, 2025 Powering Skills Organisation

knowledge of:

- data analysis techniques and tools
- inspection and test procedures
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- power generation plant operating parameters including process plant
- process plant and equipment, its location and operation
- process plant status
- Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)
- test equipment
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures
- worn, damaged or faulty process plant and equipment

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

UEPMNT422 Conduct performance testing on process plant and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct performance testing on process plant and equipment.

Performance testing is used to determine how power generation plant and equipment performs in terms of responsiveness and stability under specified workloads. It can also serve to investigate, measure, validate or verify other attributes such as scalability, reliability and resource usage.

Competency in this unit requires the ability to plan and prepare for performance tests, undertake performance tests and collect data, evaluate and analyse information and complete documentation. Individuals will, in general, work as a maintenance operative in a power generation facility.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT351 Test and commission electrical equipment

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for performance test	**1.1** Work request is received and appropriate method of testing is determined, in accordance with legislative requirements, industry standards and workplace procedures
	1.2 Safety and process plant issues are identified, in accordance with workplace procedures
	1.3 Specialist assistance and personnel are arranged, in accordance with workplace procedures
	1.4 Tools and equipment are identified and acquired, in accordance with workplace procedures
	1.5 Test equipment is calibrated as specified in industry standards, manufacturers' specifications and workplace procedures
	1.6 Performance test requirements are determined and planned, in accordance with manufacturers' specifications and workplace procedures
	1.7 Process plant is identified and its' status prior to the test is established, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

		and from appropriate personnel
	1.8	Authority to carry out work is obtained, in accordance with workplace procedures, process plant operating conditions and load requirements
2 Undertake performance test and collect data	**2.1**	Process plant is coordinated to initial operating state, ready for testing, in accordance with workplace procedures
	2.2	Performance tests and data collection are undertaken using appropriate techniques that ensure personnel safety and process plant integrity
	2.3	Performance tests are carried out, in accordance with workplace procedures
	2.4	Data is collected, in accordance with workplace procedures
	2.5	Performance test results are evaluated to accurately assess performance of process plant
	2.6	Process plant availability is declared, on completion of tests, in accordance with workplace procedures
3 Evaluate and analyse information	**3.1**	Process plant efficiency is evaluated, and analysed, in accordance with workplace procedures using data collected
	3.2	Process plant performance is measured against criteria or specifications, in accordance with workplace procedures
	3.3	Cause of abnormal process plant performance is identified by analysing technical and operational information
	3.4	Process plant integrity is maintained through consultation with appropriate personnel and reference to technical and operational documentation
	3.5	Performance test data is critiqued and validated, referencing technical information and applicable test procedure documentation
4 Complete documentation	**4.1**	Information and data is collated, in accordance with workplace procedures
	4.2	Reports and documentation are produced, in accordance

© Commonwealth of Australia, 2025 Powering Skills Organisation

with workplace procedures

4.3 Reports and documentation are presented to appropriate personnel, in accordance with workplace procedures, to facilitate implementation of recommendations

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

UEPMNT425 Maintain complex instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct maintenance of complex instrumentation equipment including, but not limited to, multi-loop equipment such as signal characterising, analogue control equipment, microprocessor controls such as programmable logic, laboratory and industrial analysers, ultrasonic and nucleonic equipment.

Maintenance is an essential part of the ongoing care and upkeep of complex instrumentation equipment that is used to measure, monitor, automate and control processes and equipment in a power generation facility.

Competency in this unit requires the ability to plan work, carry out complex instrumentation equipment maintenance and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or onsite.

Power generation maintenance personnel are typically trained and authorised to receive permits to work

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT356 Maintain instrumentation equipment

UEENEEI001B Install and set up transducers and sensing devices

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE105A Fix and secure electrotechnology equipment

UEPMNT427 Diagnose and repair faults in complex instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the diagnosis and repair of complex instrumentation configuration including, but is not limited to signal characterising equipment, totaliser units, microprocessor control and interface equipment, laboratory and field analysers, ultrasonic and nucleonic equipment.

Diagnosing and repairing complex electronic instrumentation equipment that is used to measure, monitor, automate and control processes and equipment in a power generation facility includes the inspection, testing and verification of operational efficiency to identify possible repairs.

Competency in this unit requires the ability to plan work, verify complex electronic instrumentation equipment faults, find complex electronic instrumentation equipment faults, diagnose complex electronic instrumentation equipment faults, repair complex electronic instrumentation equipment faults and to report on all completed tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

equipment fault		with workplace procedures
	2.2	Fault indicators, technical information and diagnostic techniques are used to verify reported faults in accordance with workplace procedures
	2.3	Faults are reproduced and monitored, if possible, in accordance with workplace procedures
3 Find complex instrumentation equipment fault	**3.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures and site requirements
	3.2	Complex instrumentation equipment components, wires, cables, terminations and support fixings are inspected, in accordance with workplace procedures, for faults
	3.3	Fault finding or diagnostic techniques are selected and used, in accordance with workplace procedures
	3.4	Components are disconnected to enable accurate test measurements of suspected faulty components, in accordance with workplace procedures, without back feed readings occurring
	3.5	Test and measurement instruments are used, in accordance with workplace procedures and manufacturers' specifications
4 Determine cause of complex instrumentation equipment fault	**4.1**	Appropriate personnel are consulted, if required, in accordance with workplace procedures
	4.2	Information from fault indicators and maintenance records are used, in accordance with workplace procedures
	4.3	Conclusions about the nature and cause of the complex instrumentation equipment fault are based on an analysis of available evidence, in accordance with workplace procedures
5 Repair complex instrumentation equipment fault	**5.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures and site requirements
	5.2	Faulty, worn or damaged components are repaired, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	5.3	Parts and components are selected and replaced, as required, in accordance with workplace procedures and manufactures' specifications
	5.4	Components disconnected for testing are reconnected, in accordance with workplace procedures and all terminations are checked to ensure they are electrically and mechanically sound
	5.5	All faults are repaired, in accordance with workplace procedures
	5.6	Final inspection is performed, in accordance with workplace procedures
6 Complete work	**6.1**	Work is completed and appropriate personnel are notified in accordance with workplace procedures
	6.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	6.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	6.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Assessment Requirements for UEPMNT427 Diagnose and repair faults in complex instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work and finalising completion details
- determining cause of faults using fault finding and diagnostic techniques
- determining permit to work requirements
- finding faults
- identifying and selecting materials
- implementing regulations, industry standards, codes of practice and legislation
- interpreting manufacturers' specifications and manuals
- performing instrument calibration techniques
- planning diagnosing and repairing of faults in complex instrumentation equipment work
- repairing faults
- using tools and equipment
- utilising data analysis techniques and tools
- verifying faults
- working with test and measurement instruments

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- complex instrumentation equipment
- diagnosis and repair of electronic instrumentation equipment plant and equipment, its location and operation
- equipment and material
- fault finding and diagnostic techniques
- instrument calibration techniques
- isolations
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- repair techniques
- technical drawings and manufacturers' manuals
- test and measurement instruments
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions. Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT428 Modify complex instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct modifications of complex instrumentation used in multi-loop configurations including characterising equipment, microprocessor control and interface equipment, as well as laboratory and field analysers, ultrasonic and nucleonic equipment.

Modifications can include any changes which may alter complex electronic instrumentation equipment that is used to measure, monitor, automate and control processes and equipment in a power generation facility from the manufacturers' specifications.

Competency in this unit requires the ability to plan work, carry out modifications to complex electronic instrumentation equipment and to report on all completed tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT356 Maintain instrumentation equipment

UEENEEI001B Install and set up transducers and sensing devices

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Carry out complex instrumentation	**2.1** Isolations are confirmed, where appropriate, in accordance with workplace procedures and site

© Commonwealth of Australia, 2025 Powering Skills Organisation

equipment modifications		requirements
	2.2	Complex instrumentation equipment is modified using appropriate plans, drawings and manuals, in accordance with workplace procedures
	2.3	Modifications are carried out, in accordance with workplace procedures, without damage or loss to other equipment
	2.4	Modified equipment is set up, in accordance with workplace procedures and manufacturers' specifications, to meet operational requirements
	2.5	Final inspection is performed, in accordance with workplace procedures
3 Complete work	**3.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	3.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	3.3	Tools and equipment are cleaned, maintained and stored, in accordance with workplace procedures
	3.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT428B Modify complex instrumentation equipment.

Assessment Requirements for UEPMNT428 Modify complex instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- carry out modifications using modification techniques and procedures
- communicating with personnel
- completing work and finalising completion details
- determining permit to work requirements
- identifying and selecting materials
- implementing regulations, industry standards, codes of practice and legislation
- interpreting manufacturers' specifications and manuals
- modifying complex instrumentation equipment
- planning for modification of complex instrumentation equipment work
- using tools and equipment
- utilising data analysis techniques and tools
- working with test and measurement instruments

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- equipment and materials
- instrumentation practices
- isolations

UEPMNT430 Test and commission complex instrumentation equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct testing and commissioning of complex instrumentation used in multi-loop configurations, including but not limited to, laboratory and field analysers, totaliser units, signal characterising, microprocessor control, interface, ultrasonic and nucleonic equipment.

Commissioning and testing ensures that all complex instrumentation equipment, which is used to measure, monitor, automate and control processes in a power generation facility are working efficiently and meeting operational requirements.

Competency in this unit requires the ability to plan work, test complex instrumentation equipment wiring systems, test complex instrumentation equipment piping and tubing systems, test complex instrumentation equipment, commission complex instrumentation equipment and to report on all completed work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT433 Conduct routine generator electrical maintenance

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake routine generator electrical maintenance tasks. Routine maintenance is the practice of monitoring, inspecting and performing reviews of generator electricals in a power generation facility on a regular basis to ensure the safe and efficient operation of all parts and components.

Competency in this unit requires the ability to plan work, carry out electrical generator inspections, evaluate/analyse inspection results, prepare remedial action plans and update documentation. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT346 Maintain electrical equipment

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

UEENEEG063A Arrange circuits, control and protection for general electrical installations

© Commonwealth of Australia, 2025 Powering Skills Organisation

UEENEEG101A Solve problems in electromagnetic devices and related circuits

UEENEEG102A Solve problems in low voltage A.C. circuits

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

UEPMNT440 Diagnose and repair faults in power plant inverter systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to diagnose and repair faults in power generation plant inverter systems, including associated accessories, components and wiring systems.

The diagnosis and repair of inverter system faults requires the inspection, repair and verification to ensure that it is working efficiently and meeting operational requirements.

Competency in this unit requires the ability to plan work, verify fault, find fault, determine cause of fault, repair fault and complete all work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT366 Maintain power plant inverter systems

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

	1.3 Resources are obtained and inspected for compliance with job specifications
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct quantity of materials and components for work are obtained and inspected for compliance with job specification
	1.6 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7 Potential hazards are identified and risk control

© Commonwealth of Australia, 2025 Powering Skills Organisation

		measures are selected and implemented, in accordance with workplace procedures
	1.8	Work area is prepared, in accordance with workplace procedures
2 Verify fault	**2.1**	Normal performance and function of inverter system equipment is ascertained by consulting appropriate personnel and reference sources, in accordance with workplace procedures
	2.2	Fault indicators, technical information and diagnostic techniques are used to verify reported faults, in accordance with workplace procedures
	2.3	Faults are reproduced and monitored, if possible, in accordance with workplace procedures
3 Find fault	**3.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures
	3.2	Equipment components, wires and terminations are inspected for faults, in accordance with workplace procedures
	3.3	Diagnostic techniques are selected and used, in accordance with workplace procedures
	3.4	Components are disconnected to enable accurate test measurements of suspected faulty components, without concern of back feed readings, in accordance with workplace procedures
	3.5	Test and measurement instruments are used, in accordance with workplace procedures and manufacturers' instructions
4 Determine cause of fault	**4.1**	Appropriate personnel are consulted to obtain details relating to faulty system, in accordance with workplace procedures
	4.2	Use is made of information from fault indicators and maintenance records, in accordance with workplace procedures
	4.3	Conclusions about nature and cause of fault are reached from analysis of available evidence, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

5 Repair fault	**5.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures
	5.2	Faulty, worn or damaged components are replaced or repaired, in accordance with workplace procedures
	5.3	Parts and components are selected and used, in accordance with manufacturers' specifications and workplace procedures
	5.4	Inverter system components are disconnected for testing and are reconnected having been proven free of faults, and all terminations are then checked to ensure they are electrically and mechanically sound, in accordance with workplace procedures
	5.5	Faults are repaired, in accordance with workplace procedures
	5.6	Final inspection is performed, in accordance with workplace procedures
6 Complete work	**6.1**	Work is completed and appropriate personnel are notified, in accordance with workplace procedures
	6.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	6.3	Tools and equipment are maintained and stored, in accordance with workplace procedures
	6.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Assessment Requirements for UEPMNT440 Diagnose and repair faults in power plant inverter systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled requirements
- determining cause of faults using data analysis techniques and tools
- determining permit to work requirements
- finding faults using diagnostic techniques and procedures
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- planning and preparing for diagnosis and repair of faults in power plant inverter systems work
- repairing faults using repair techniques and procedures
- selecting materials
- using manufacturers' specifications and manuals
- utilising test and measurement instruments
- verifying faults using verification techniques

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- diagnostic techniques
- equipment and materials

© Commonwealth of Australia, 2025 Powering Skills Organisation

- generation plant and equipment, its location and operation
- isolations
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- repair techniques
- test and measurement instruments
- typical arrangements of power production plant
- verification techniques
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT442 Maintain wind turbine generator electrical systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake scheduled maintenance of electrical systems in large scale wind turbine generators.

Maintenance is the process of optimising power generation plant and equipment operations through regular inspections and verification of electrical systems in large scale wind turbine generators.

Competency in this unit requires the ability to plan work, conduct maintenance on wind turbine generator electrical systems and complete all work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT371 Maintain large scale wind turbine generators

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEE102A Fabricate, assemble and dismantle electrotechnology components

UEENEEE104A Solve problems in D.C circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG101A Solve problems in electromagnetic devices and related circuits

UEENEEG102A Solve problems in low voltage A.C. circuit

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and are confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Work is planned, sequenced and prioritised, in accordance with workplace procedures
	1.6 Work area is prepared, in accordance with workplace procedures
2 Conduct maintenance on wind turbine generator electrical systems	**2.1** Wind turbine generator equipment is replaced, if required, due to faulty operation or maintenance plan requirements, in accordance with workplace procedures and manufacturers' specifications
	2.2 Documented service checklists, or similar are followed, in accordance with workplace procedures
	2.3 Diagnostic testing and data from monitoring systems is used to identify those components requiring

© Commonwealth of Australia, 2025 Powering Skills Organisation

		maintenance
	2.4	Wind turbine generator equipment is dismantled, if required, for maintenance, in accordance with manufacturers' specifications and workplace procedures
	2.5	Techniques are used to enable identification or reassembly of wind turbine generator equipment, in accordance with workplace procedures
	2.6	New components are obtained, if required, and are inspected for compliance with manufacturers' specifications
	2.7	Wind turbine generator equipment is tested, monitored and adjusted, if required, in accordance with workplace procedures and manufacturers' specifications
3 Complete work	**3.1**	Work is completed and appropriate personnel are notified, in accordance with workplace requirements
	3.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	3.3	Tools and equipment are maintained and stored, in accordance with workplace procedures
	3.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT442A Maintain wind turbine generator electrical systems.

Assessment Requirements for UEPMNT442 Maintain wind turbine generator electrical systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled requirements
- conducting maintenance on Wind Turbine Generator (WTG) electrical systems
- determining work to permit requirements
- identifying new components for use
- implementing legislation, industry standards, codes of practice and regulations
- measuring, inspecting and recording Wind Turbine Generator (WTG) electrical system
- performing isolations
- planning for wind turbine generator electrical system work
- reassembling and readjusting equipment and components in wind turbine generator electrical systems
- undertaking diagnostic testing
- using manufacturers' specifications and manuals

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- analysis and diagnostic methods and tools
- component identification and replacement
- isolations

© Commonwealth of Australia, 2025 Powering Skills Organisation

- legislation, industry standards, codes of practice and regulations
- maintenance of wind turbine generator electrical systems
- manufacturers' specifications and manuals
- measurement techniques
- permit to work system
- techniques for recognising wiring failure or potential for failure of wind turbine generator system and equipment
- test requirements of wind turbine generator electrical system
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - hazard identification
  - safe working practices
- wind turbine generator plant and its location at site
- wind turbine generator system types and characteristics
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPMNT445 Diagnose and repair faults in large scale wind turbine generators

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to diagnose and repair faults in large scale wind turbine generator systems.

Diagnosing and repairing faults is the process of inspecting wind turbine generator systems to identify problems and ensure repairs take place. The aim is to enhance the overall delivery of large scale wind turbine generator systems.

Competency in this unit requires the ability to gather data, interpret data to establish a theory about fault, repair faults and record faults. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT371 Maintain large scale wind turbines generators

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

UEENEEG063A Arrange circuits, control and protection for general electrical installations

UEENEEG101A Solve problems in electromagnetic devices and related circuits

UEENEEG102A Solve problems in low voltage A.C. circuits

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

Competency Field

Maintenance

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Gather data	**1.1** Wind turbine generator system's data logging information and error codes are accessed, in accordance with workplace procedures
	1.2 Wind turbine generator system's sensory data on fault is gathered
	1.3 Hard copy or online documentation is accessed to support fault finding process, in accordance with workplace procedures
	1.4 Fault indicators and error codes are examined and interpreted, in accordance with workplace procedures
	1.5 Circuit diagrams, manufacturers' specifications, schematics and/or consultation with technical advisors are used to determine circuit and system characteristics and function
2 Interpret data to establish hypothesis about fault	**2.1** Wind turbine generator system performance parameters are identified and applied to interpretation of fault data
	2.2 Wind turbine generator system faults are verified, or localised, using approved techniques, procedures, tools and test equipment

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.3	Priorities are set for testing or replacement of specific components, wiring and connections in wind turbine generator systems
3 Repair fault	**3.1**	Risk analysis is undertaken, in accordance with workplace procedures, and is communicated to the work team
	3.2	Safety precautions including circuit isolations, physical barriers and other protective devices or systems are used, where appropriate
	3.3	Tests are conducted to ensure fault has been correctly repaired or isolated, in accordance with workplace procedures
	3.4	Wind turbine generator system faulty components that have been removed from service are examined and cause of problem is identified
	3.5	Loose connections or wiring in the wind turbine generator system are repaired, in accordance with workplace procedures
	3.6	Parts or components are removed and replaced with tested and operational parts
	3.7	Wind turbine generator system is tested, in accordance with workplace procedures, to ensure correct operation
	3.8	Fault finding process is escalated to repairing a complex fault using a technical adviser, if required
4 Record fault	**4.1**	Wind turbine generator system's faulty components and parts are correctly tagged, identified and stored, in accordance with workplace procedures
	4.2	Wind turbine generator system's faults are recorded, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

UEPMNT446 Coordinate maintenance on a wind farm

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to coordinate scheduled servicing and maintenance of wind turbine generators on a wind farm.

Scheduled maintenance is the process of optimising plant and equipment operations through regular inspections and verification of wind turbine generators for operational efficiency.

Competency in this unit requires the ability to plan for scheduled maintenance, coordinate scheduled maintenance, respond to wind turbine generator breakdown, produce production and maintenance reports and make recommendations for dealing with wind turbine generator breakdowns. Individuals will, in general, work as a coordinator in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT445 Diagnose and repair faults in large scale wind turbine generators

UEPMNT448 Diagnose and repair faults in large scale wind turbine generator control systems

UEPMNT449 Diagnose and repair mechanical systems faults in large scale wind turbine generators mechanical systems

UEPMNT371 Maintain large scale wind turbines generators

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

UEENEEE104A Solve problems in D.C. circuits

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan for scheduled maintenance	**1.1** Maintenance schedules provided by key stakeholders and organisational representatives are accessed and interpreted
	1.2 Local maintenance work schedules are developed, in accordance with workplace procedures
	1.3 Stock and spare parts are identified, in accordance with workplace procedures
2 Coordinate scheduled maintenance	**2.1** Roles and tasks are allocated to onsite personnel, in accordance with workplace procedures
	2.2 Scheduled maintenance is performed, in accordance with workplace procedures and within established

© Commonwealth of Australia, 2025 Powering Skills Organisation

		timeframes
	2.3	A financial budget for scheduled maintenance is identified and coordinated
	2.4	Maintenance tasks are completed as per the maintenance schedule and industry standards
	2.5	Allocation of work tasks is coordinated, in accordance with workplace procedures
	2.6	Risk control measures are identified, prioritised and evaluated against maintenance schedule
	2.7	Work permits are secured for performance of maintenance tasks, in accordance with workplace procedures
3 Respond to wind turbine generator breakdown	**3.1**	An action plan for wind turbine generator breakdowns is developed and implemented, in accordance with workplace procedures
	3.2	Key stakeholders, personnel and organisations are advised of outage, in accordance with workplace procedures
	3.3	Out of hours' breakdown roster is updated and applied, in accordance with workplace procedures
	3.4	Analysis of wind turbine generator breakdown to determine likely remediation actions is undertaken, in accordance with workplace procedures
	3.5	Resources to find cause of wind turbine generator fault or breakdown are allocated
	3.6	Escalation procedures are applied, if required, for wind turbine generator fault
	3.7	Remediation for defective components or plant is selected, in accordance with workplace procedures
	3.8	Technical advice is given regarding potential hazards, safety risks and risk control measures or appropriate authorities are consulted
	3.9	Solutions to non-routine problems are identified and actioned, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

4 Produce production and maintenance reports	**4.1** Wind turbine generator records to produce maintenance reports are accessed
	4.2 Reports are produced, in accordance with workplace procedures and standards using applicable software and formats
	4.3 Reports are distributed to stakeholders and appropriate personnel, in accordance with workplace procedures
5 Make recommendations for dealing with wind turbine generator breakdowns	**5.1** Recommendations for dealing with wind turbine generator breakdowns are made to appropriate personnel
	5.2 Debriefing discussion is held with team members to facilitate managing similar wind turbine generator breakdowns

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT446A Coordinate maintenance on a wind farm.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPMNT446 Coordinate maintenance on a wind farm

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel and stakeholders
- coordinating scheduled maintenance
- determining permit to work requirements
- developing maintenance schedule plan
- implementing legislation, industry standards, codes of practice and regulations
- making recommendations for dealing with wind turbine generator breakdowns
- planning for scheduled maintenance work
- producing maintenance reports
- producing maintenance reports
- providing direction to team members involved in maintenance activities
- responding to wind turbine generator breakdown
- using manufacturers' specifications and manuals
- utilising risk control register

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- communication in a team environment
- coordination responsibilities

© Commonwealth of Australia, 2025 Powering Skills Organisation

- development of team members through task allocation
- equipment spares and consumables suitable for maintenance
- escalations for identified faults
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- organising maintenance schedules and plans
- permit to work system
- report writing including standards and styles
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPMNT447 Diagnose and repair faults in wind turbine generator electrical systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to diagnose and repair faults in large scale wind turbine generator electrical systems.

Diagnosis and repair of faults is the process of optimising large scale wind turbine generator electrical system outcomes through regular inspection and verification of operational efficiency.

Competency in this unit requires the ability to gather data, interpret data to establish hypothesis about wind turbine generator electrical system fault, repair wind turbine generator electrical system fault and record wind turbine generator electrical system fault. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT371 Maintain large scale wind turbine generators

UEPMNT442 Maintain wind turbine generator electrical systems

UEPMNT445 Diagnose and repair faults in large scale wind turbine generators

UEENEEE102A Fabricate, assemble and dismantle electrotechnology components

UEENEEE104A Solve problems in D.C circuits

UEENEEE105A Fix and secure electrotechnology equipment

UEENEEE107A Use drawings, diagrams, schedules, standards, codes and specifications

UEENEEG006A Solve problems in single and three phase low voltage machines

© Commonwealth of Australia, 2025 Powering Skills Organisation

UEENEEG033A Solve problems in single and three phase low voltage electrical apparatus and circuits

UEENEEG063A Arrange circuits, control and protection for general electrical installations

UEENEEG101A Solve problems in electromagnetic devices and related circuits

UEENEEG102A Solve problems in low voltage A.C. circuits

UEENEEG106A Terminate cables, cords and accessories for low voltage circuits

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

Competency Field

Maintenance

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Gather data	**1.1** Data logging information and error codes are accessed, in accordance with workplace procedures
	1.2 Sensory data on fault is gathered, in accordance with workplace procedures
	1.3 Documentation is accessed, in accordance with workplace procedures, to support fault finding process
	1.4 Built in fault indicators and error codes are, where appropriate, examined and interpreted
	1.5 Reference to circuit diagrams, manufacturers' specifications, schematics or consultation with technical adviser is used to determine electrical circuit or system functions and characteristics
2 Interpret data to establish hypothesis about wind turbine generator electrical system fault	**2.1** Knowledge of wind turbine generator electrical systems and performance parameters is applied to interpretation of fault data

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.2	Wind turbine generator electrical system faults are verified or localised using appropriate techniques, tools and test equipment, in accordance with workplace procedures.
	2.3	Priorities are set for testing or replacement of specific components, wiring and connections in the wind turbine generator electrical system
3 Repair wind turbine generator electrical system fault	**3.1**	Risk analysis is undertaken and is communicated to work team and appropriate personnel, in accordance with workplace procedures
	3.2	Safety precautions including circuit isolations, physical barriers and other protective devices or systems are, where appropriate, used in accordance with workplace procedures
	3.3	Tests are conducted to ensure wind turbine generator electrical system fault has been isolated
	3.4	Faulty components are removed from service and are examined to identify the cause of the problem
	3.5	Loose connections or wiring are repaired, in accordance with workplace procedures
	3.6	Faulty parts of wind turbine generator electrical system are removed and replaced with tested and operational parts
	3.7	Wind turbine generator electrical system is tested, in accordance with workplace procedures, to ensure correct operation
	3.8	Repairs to complex faults are, if required, escalated, in accordance with workplace procedures, to a technical adviser
4 Record wind turbine generator electrical system fault	**4.1**	Wind turbine generator electrical system faulty components and parts are tagged, identified and stored, in accordance with workplace procedures
	4.2	Faults are recorded, in accordance with workplace procedures

UEPMNT449 Diagnose and repair mechanical systems faults in wind turbine generators

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to diagnose and repair mechanical system faults in large scale wind turbine generators.

Diagnosing and repairing faults is the process of inspecting large scale wind turbine generators to identify problems and ensure repairs take place. The aim is to ensure that the overall delivery of the large scale wind turbine generators meets operational requirements.

Competency in this unit requires the ability gather data, interpret data to establish theory about wind turbine generator mechanical system faults, repair wind turbine generator mechanical system faults and record wind turbine generator mechanical system faults. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPMNT450 Test and commission wind turbine generators

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct testing and commissioning of a wind turbine generator.

Testing and commissioning of wind turbine generators includes the assessment and verification that all equipment and components are operating efficiently and are meeting operational requirements.

Competency in this unit requires the ability to plan work, test systems equipment, test system and complete all work tasks. Individuals will, in general, work under supervision in an electrical, electronic and/or mechanical equipment repair workshop or on site.

Power generation maintenance personnel are typically trained and authorised to receive permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit of competency may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional and/or other conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

UEPMNT371 Maintain large scale wind turbine generators

UEPMNT444 Maintain wind turbine generator mechanical systems

UEPMNT443 Maintain wind turbine generator control systems

UEPMNT448 Diagnose and repair faults in wind turbine generator control systems

UEPMNT449 Diagnose and repair mechanical systems faults in wind turbine generators

UEPMNT445 Diagnose and repair faults in large scale wind turbine generators

UEENEEG108A Troubleshoot and repair faults in low voltage electrical apparatus and circuits

UEENEEE102A Fabricate, assemble and dismantle utilities industry components

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements including scope of work and assigned roles are identified and confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are reviewed in preparation for work
	1.3 Resources are obtained and inspected for compliance with job specification
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct materials and components for work are obtained and inspected for compliance with job

© Commonwealth of Australia, 2025 Powering Skills Organisation

		specification
	1.6	Commissioning is planned, sequenced and prioritised, in accordance with workplace procedures
	1.7	Potential hazards are identified and risk control measures are implemented, in accordance with workplace procedures
	1.8	Work area is accessed and prepared, in accordance with workplace procedures
2 Test systems equipment	**2.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures
	2.2	Wind turbine generator system equipment is visually inspected to ensure absence of any damage, defects and deterioration, in accordance with workplace procedures and commissioning plan
	2.3	Wind turbine generator system equipment is tested, in conjunction with other related systems and equipment, to ensure correct operation, in accordance with workplace procedures and commissioning plan
	2.4	Wind turbine generator wiring systems are checked and tested, in conjunction with other related systems and equipment, in accordance with workplace procedures and commissioning plan
3 Test system	**3.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures
	3.2	Wind turbine generator system, plant and equipment are set up and calibrated, in accordance with workplace procedures, operational requirements and manufacturers' specifications
	3.3	Wind turbine generator system is commissioned using appropriate plans, drawings and manuals, in accordance with workplace procedures and commissioning plan
	3.4	Wind turbine generator system is commissioned, in conjunction with other related systems and equipment, in accordance with workplace procedures and commissioning plan
	3.5	Wind turbine generator equipment is commissioned, in accordance with workplace procedures and

© Commonwealth of Australia, 2025 Powering Skills Organisation

		commissioning plan
	3.6	Faulty wind turbine generator equipment is repaired or reported, in accordance with workplace procedures
	3.7	Final inspection is carried out, in accordance with workplace procedures and commissioning plan
4 Complete work	**4.1**	Wind turbine generator commissioning is completed and appropriate personnel are notified, in accordance with workplace procedures
	4.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	4.3	Tools and equipment are maintained and stored, in accordance with workplace procedures
	4.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPMNT450A Test and commission wind turbine generators.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPMNT450 Test and commission wind turbine generators

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work as per scheduled requirements
- determining permit to work requirements
- implementing legislation, industry standards, codes of practice and regulations
- inspecting wind turbine generator system and wiring
- planning for testing and commissioning wind turbine generator work
- selecting materials
- testing and commissioning wind turbine generator system
- testing wind turbine generator systems equipment
- undertaking isolations
- using data analysis techniques and tools
- using manufacturers' specifications and manuals
- utilising tools and equipment

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- equipment and materials required
- installation, testing and commissioning practices

© Commonwealth of Australia, 2025 Powering Skills Organisation

- isolations
- layout of wind farm plant, and operation of equipment
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- manufacturers' wind turbine generator components and parts
- permit to work system
- test and measurement instruments and techniques for use
- types of wind turbine generators and wiring systems
- typical arrangements of wind farm power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPL001 Licence to operate a steam turbine

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit specifies the outcomes required to operate a steam turbine for licensing purposes, steam turbine means equipment that is driven by steam acting on a turbine or rotor to cause a rotary motion.

It covers the operation of any steam turbine (except a steam turbine that produces a power output of less than 500 kW) that:

- is multi-wheeled
- is capable of a speed greater than 3600 rpm or
- uses attached condensers or
- a multi-staged heat exchange extraction process.

This unit requires the operator to plan the work, carry out preoperational safety checks, start the steam turbine, monitor steam turbine operation and shutdown the steam turbine.

A person performing this work is required to hold a turbine operation high risk work (HRW) licence.

Licensing/Regulatory information

This unit is based on the licensing requirements of Part 4.5 of the Model Work Health and Safety (WHS) Regulations, HRW and meets Commonwealth, state and territory HRW licensing requirements.

Any alteration to this unit would result in a unit that would not be acceptable to Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulators for the purpose of licensing.

Pre-requisite Unit

There are no prerequisite units

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan work	**1.1** Type of operations to be conducted for steam turbine are assessed and prepared
	1.2 Steam turbine operations are planned, in accordance with procedures
	1.3 Personal Protective Equipment (PPE) is selected for use, ensuring statutory requirements and procedures are followed
	1.4 Hazards and potential hazards in work area are identified and assessed for risk, and controls recommended are consistent with appropriate standards
	1.5 Appropriate communication methods are identified, in accordance with procedures
2 Start-up steam turbine	**2.1** Downstream user of output power from steam turbine is advised of start up
	2.2 Controls are implemented for identified hazards and potential hazards in work area consistent with appropriate standards
	2.3 Availability of quality steam from upstream provider is confirmed
	2.4 Preoperational safety checks of steam turbine are conducted, in accordance with procedures
	2.5 Start-up checks are performed upon ancillary plant
	2.6 Maintenance requirements are identified and reported, in accordance with procedures
	2.7 Steam turbine is started and brought up to speed and placed on line safely, in accordance with procedures, including performance of start-up checks

© Commonwealth of Australia, 2025 Powering Skills Organisation

3	**Monitor steam turbine operation**	**3.1** Steam turbine is monitored, in accordance with required procedures, including performing of operational checks and fault finding
		3.2 Operating log is maintained clearly and accurately, in accordance with established procedures
		3.3 Operating status of steam turbine is diagnosed and verified
		3.4 Status of steam turbine is communicated to other operational personnel, including downstream users of steam turbine output power
		3.5 Steam turbine emergencies and contingencies are dealt with, in accordance with local workplace procedures, manufacturers' specifications and environmental requirements
4	**Shut down steam turbine**	**4.1** Energy isolation procedures are followed
		4.2 Routine shutdown of steam turbine is performed, in accordance with operational and manufacturers' requirements and procedures, including performing shut down checks
		4.3 Maintenance requirements are identified, recorded and reported, in accordance with procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Assessment Requirements for UEPOPL001 Licence to operate a steam turbine

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least one occasion and includes:

- communicating effectively and working safely with others in the work area
- completing verification of problems and steam turbine equipment faults and demonstrating appropriate response procedures
- compliance with Commonwealth, state or territory regulations for the acquisition of a high risk work licence for steam turbine operation
- compliance with legislation, regulations, standards, codes of practice and established safe practices and procedures for starting, operating, shutting down and maintaining a steam turbine
- compliance with organisational and site policies and procedures including quality requirements and state or territory legislation applicable to workplace operations
- compliance with WHS and environmental regulations, policies and procedures
- controlling and monitoring any ancillary equipment which may be connected or interfaced to the steam turbine recording accurately and maintaining information related to operation of a steam turbine
- identifying hazards associated with the operation of the steam turbine and put in place effective hazard controls for those hazards identified
- performing efficiently and safely when starting, operating, shutting down and maintaining a steam turbine
- starting up, monitoring and shutting down a steam turbine effectively which meets the definition of this licence class
- undertaking diagnostic and testing techniques as applied to steam turbines
- using appropriate communication techniques with colleagues and others
- utilising relevant tools and equipment

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- basic principles of heat transfer and thermodynamics
- Commonwealth, state or territory WHS legislation, regulations, standards and codes of practice relevant to the full range of techniques for operating steam turbines
- confined space awareness and the limits for entry into a confined space
- environmental protection requirements relating to the disposal of waste material and storage of environmentally hazardous materials
- established communication channels and protocols in the workplace
- organisational and workplace standards, requirements, policies and procedures for starting, operating, shutting down and maintaining a steam turbine
- procedures for the recording, reporting and maintenance of workplace records and information
- safety data sheets and material handling methods
- steam turbine capabilities and components
- steam turbine fault finding and problem solving techniques
- steam turbine operations and operating techniques
- steam turbine safety devices and testing techniques
- steam turbine speed control equipment
- system components and their interaction with other plant and equipment.
- typical routine problems encountered in the process and with equipment and adjustments required for correction
- understanding of the hierarchy of hazard identification and control

Assessment Conditions

Assessments must be conducted by an assessor accredited for this High Risk Work (HRW) licence class in the Commonwealth, state or territory where the licence will be obtained (i.e. an assessor authorised by a Commonwealth, state or territory WHS/OHS regulator).

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment of performance must be undertaken in the workplace and/or under realistic workplace conditions which typically reflect:

- performing tasks and activities within timelines that would be expected in a workplace
- standard and authorised work practices, safety requirements and environmental constraints
- using full scale equipment

The use of simulators in the assessment of this unit of competency is acceptable.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools and equipment used in industry including:
  - Personal Protective Equipment (PPE) for performance assessment
  - appropriate safety equipment in safe condition
  - appropriate steam turbine and associated equipment in safe condition
- communication equipment, as required, applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPL002 Licence to operate a reciprocating steam engine

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit specifies the outcomes required to operate a reciprocating steam engine for licensing purposes, which includes the operation of steam equipment where the steam acts upon a piston under pressure.

Reciprocating steam engine means equipment that is driven by steam acting on a piston causing the piston to move and includes and expanding (steam) reciprocating engine.

High risk work is classed as the operation of a reciprocating steam engine where the diameter of any piston exceeds 250 millimetres.

This unit requires the operator to plan the work, carry out pre-operational safety checks, start the reciprocating steam engine, monitor the reciprocating steam engine operation, carry out shut down of reciprocating steam engine for operational and maintenance purposes.

A person performing this work is required to hold a reciprocating steam engine operation high risk work (HRW) licence.

Licensing/Regulatory information

This unit is based on the licensing requirements of Part 4.5 of the Model Work Health and Safety (WHS) Regulations, HRW and meets Commonwealth, state and territory HRW licensing requirements.

Any alteration to this unit would result in a unit that would not be acceptable to Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulators for the purpose of licensing.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Licensing There are no prerequisite units.

Unit Sector

Electricity generation

© Commonwealth of Australia, 2025 Powering Skills Organisation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan work	**1.1** Types of operations to be conducted for a reciprocating steam engine are assessed and prepared
	1.2 Personal Protective Equipment (PPE) is selected for use, ensuring statutory requirements and procedures are followed
	1.3 Hazards and potential hazards in work area are identified and assessed for risk and controls recommended are consistent with appropriate standards
	1.4 Pre-operational safety checks of reciprocating steam engine and equipment are conducted, in accordance with statutory requirements and procedures
	1.5 Maintenance requirements and equipment faults are identified and reported, in accordance with procedures
	1.6 Communication methods are identified according to procedures
2 Start reciprocating steam engine	**2.1** Controls are implemented for hazards in work area consistent with industry standards
	2.2 Start-up checks are performed and the reciprocating steam engine is brought on line safely, in accordance with statutory requirements and procedures
	2.3 Maintenance requirements are identified and reported, in accordance with procedures
3 Monitor reciprocating steam engine operation	**3.1** Reciprocating steam engine is monitored, in accordance with statutory requirements and workplace procedures, including undertaking operational checks
	3.2 Operating log is maintained clearly and accurately, in accordance with statutory requirements and procedures
	3.3 Information regarding reciprocating steam engine, its status and operation is communicated clearly in accordance with procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

4 Shut down reciprocating steam engine	**4.1**	Engine is shut down in accordance with statutory requirements and procedures, including shut down checks and shut down checks for maintenance
	4.2	Reciprocating steam engine is isolated in accordance with procedures
	4.3	Maintenance requirements are identified, recorded and reported in accordance with procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

appropriate standards must include	but not be limited to: • codes of practice • legislation • Australian Standards • manufacturers' specifications
communicated and/or communication must include	but are be limited to: • verbal • written • telephone • two-way radio • log records • computer record systems
emergencies must include	but not be limited to: • fire • bomb threat • terrorism • personal accidents • chemical spills • major steam leaks • major water leaks

© Commonwealth of Australia, 2025 Powering Skills Organisation

	• flooding • natural disasters
equipment must include	but not be limited to: • engine and auxiliary plant • engine lubrication and power or control oil systems • hydraulic oil system • pump • compressed air system • steam supply system • cylinder exhaust system • computers with equipment control functions • supervisory, alarm, protection and control equipment • relevant maintenance equipment including equipment for: • lock out for protecting operators and co-workers from accidental injury • emergency shutdown stopping • extinguishing fires • organisational first aid requirements • evacuation
equipment faults must include	but not be limited to: • abnormal operating conditions • loss of a major auxiliary • excessively high engine and engine valves heating rates or differentials • high engine bearing temperatures or vibration • high pressure heater malfunctions • mechanical or electrical faults or failure • failed field devices • engine protection
hazards must include	but not be limited to: • chemical hazards • thermal hazards • manual handling hazards • guarding of machinery requirements • illumination of work area • rubbish and combustibles in area

© Commonwealth of Australia, 2025 Powering Skills Organisation

	• leakage of steam • leakage of fuel • obstructions in work area • fire • noise • vibration • water • working at heights
operational checks must include	but not be limited to: • supply and quality of steam and line pressure • exhaust system • safety devices • speed governor • vibration level • lubrication system • operation and function of valves and fittings • cylinder drainage system • operation of control and/or safety devices
Personal Protective Equipment (PPE) must include	but not be limited to: • prescribed under legislation, regulation and codes of practice • workplace policies and practices • hard hat • safety boots • gloves • high visibility clothing • breathing, hearing, sight, skin and sun protection • fall arrest equipment such as harnesses and lanyards, horizontal life lines and inertia reel
preoperational safety checks may include	but not be limited to: • supply steam system • position and operation of engine valves • lubrication system • cylinder drainage system • exhaust system • auxiliary equipment • safety devices • over speed shut down • pressure relief devices

© Commonwealth of Australia, 2025 Powering Skills Organisation

	• speed governor
procedures must include	but not be limited to: • manufacturers' guidelines (e.g. instructions, specifications or checklists) • industry operating procedures • workplace procedures (e.g. work instructions, operating procedures and checklists)
operation of steam equipment must include	• where the steam acts upon a piston under pressure where this action of the steam forces the piston to move. • the definition includes all expanding (steam) reciprocating engines, with any piston diameter of greater than 250 millimetres
recorded must include	but not be limited to: • operations and maintenance of reciprocating steam engine equipment • difficulties or issues • environmental issues • recommendations for future work • results • costs • hazards • incidents or injuries • dangerous occurrences or equipment • malfunctions using log books • proformas • production reports • maintenance records
shutdown checks must include	but not be limited to: • steam supply • cooling process • load on engine • cylinder drains • auxiliary equipment
shutdown checks for maintenance must include	but not be limited to: • checks of cooling down process • isolation of steam • isolation from any common connection • opening of all access points required for

Assessment Requirements for UEPOPL002 Licence to operate a reciprocating steam engine

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least one occasion and includes:

- communicating effectively and working safely with others in the work area
- completing verification of problems and equipment faults and demonstrate appropriate response procedures
- compliance with Commonwealth, state or territory regulations for the acquisition of a high risk work licence for reciprocating steam engine operation
- compliance with legislation, regulations, standards, codes of practice and established safe practices and procedures for starting, operating, shutting down and maintaining a reciprocating steam engine
- compliance with organisational and site policies and procedures including quality requirements and state or territory legislation applicable to workplace operations
- compliance with WHS and environmental regulations, policies and procedures
- identifying hazards associated with the operation of the reciprocating steam engine and put in place effective hazard controls for those hazards identified
- performing efficiently and safely when starting, operating, shutting down and maintaining a reciprocating steam engine
- recording accurately and maintaining information relating to operation of a reciprocating steam engine
- starting up, monitoring and shutting down a reciprocating steam engine effectively that meets the definition of this licence class
- undertaking diagnostic and testing techniques for reciprocating steam engines
- using appropriate communication techniques with colleagues and others
- utilising relevant tools and equipment

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- basic principles of heat transfer and thermodynamics

© Commonwealth of Australia, 2025 Powering Skills Organisation

- Commonwealth, state or territory WHS legislation, regulations, standards and codes of practice relevant to the full range of techniques for operating reciprocating steam engines
- confined space awareness and the limits for entry into a confined space
- engine speed control equipment
- environmental protection requirements relating to the disposal of waste material and storage of environmentally hazardous materials
- established communication channels and protocols in the workplace
- hierarchy of hazard identification and control
- organisational and workplace standards, requirements, policies and procedures for starting, operating, shutting down and maintaining a reciprocating steam engine

- reciprocating steam engine fault finding and problem solving techniques
- reciprocating steam engine operations and operating techniques
- reciprocating steam engine safety devices and testing techniques
- routine problems encountered in the process and with equipment and adjustments required for correction
- safety data sheets and material handling methods
- system components and their interaction with other plant and equipment
- types of tools and equipment and procedures for use, operation and maintenance

Assessment Conditions

Assessments must be conducted by an assessor accredited for this High Risk Work (HRW) licence class in the Commonwealth, state or territory where the licence will be obtained (i.e. an assessor authorised by a Commonwealth, state or territory WHS/OHS regulator).

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment of performance must be undertaken in the workplace and/or under realistic workplace conditions which typically reflect:

- performing tasks and activities within timelines that would be expected in a workplace
- standard and authorised work practices, safety requirements and environmental constraints
- using full scale equipment

The use of simulators in the assessment of this unit of competency is not acceptable.

Resources for assessment must include access to:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools and equipment and currently used in industry including:
  - Personal Protective Equipment (PPE) for performance assessment
  - appropriate safety equipment in safe condition
  - appropriate reciprocating steam engine and associated equipment in safe condition
- communication equipment, as required applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS202 Apply quality systems to work

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to apply a quality assurance system to work.

Quality control is a process to ensure that significant variations in quality are kept to a minimum. Quality control in a power generation facility will focus on a set of procedures intended to ensure that personnel, plant and equipment operate smoothly and efficiently.

Competency in this unit requires the ability to plan and prepare quality procedures, conduct quality system practices and initiate changes to quality systems. Individuals will, in general, work as an operator in a power generation facility.

No licensing, legislative or certification requirements apply from this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS **PERFORMANCE CRITERIA**

© Commonwealth of Australia, 2025 Powering Skills Organisation

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare to work with quality systems	**1.1** Quality procedures are identified from quality system and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, in accordance with workplace procedures
	1.2 Performance objectives are identified, in accordance with workplace procedures and Quality Management System (QMS)
	1.3 Work plan is structured, in accordance with workplace procedures and site requirements, to ensure quality standards are achieved
2 Conduct quality system practices	**2.1** Quality assurance processes and procedures are implemented, in accordance with workplace procedures and manufacturers' recommendations
	2.2 Work is monitored against quality standards and sustainable energy principles, and are clarified with appropriate personnel, in accordance with workplace procedures
	2.3 Allocated work tasks are completed, in accordance with workplace procedures and quality assurance requirements
3 Initiate changes to quality systems	**3.1** Improvements to quality assurance procedures are identified by analysis of system outcomes, in accordance with workplace procedures and quality assurance requirements
	3.2 Extent of proposed changes to quality procedures are investigated, in accordance with workplace procedures and quality assurance
	3.3 Proposed improvements are negotiated and confirmed with appropriate personnel, in accordance with workplace procedures and quality assurance requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS202B Apply quality systems to work.

Assessment Requirements for UEPOPS202 Apply quality systems to work

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying continuous improvement techniques
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with personnel
- complying with legislation, industry standards, codes of practice and regulations
- contributing to quality control audits
- identifying quality procedural change requirements
- improving quality control procedures
- initiating changes to quality assurance processes and procedures
- planning and preparing for quality control
- using recording procedures for documenting
- utilising sustainable energy principles and practices
- working with quality assurance procedures, tools and techniques

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- continuous improvement
- continuous improvement techniques
- legislation, industry standards, codes of practice and regulations
- principles of sustainable energy practice
- procedural quality change requirements

© Commonwealth of Australia, 2025 Powering Skills Organisation

- quality control
- quality control audits including improvement implementation
- Quality Management System (QMS) tools and techniques
- WHS/OHS including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS203 Operate and monitor communications system

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate and monitor a communications system.

A communications system includes the various processes, both formal and informal, by which information is passed between personnel within a power generation facility itself and its clients, customers and stakeholders.

Competency in this unit requires the ability to plan work, operate and monitor a communications system and completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

No licensing, legislative or certification requirements apply from this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS **PERFORMANCE CRITERIA**

© Commonwealth of Australia, 2025 Powering Skills Organisation

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Select and use equipment	**1.1** An appropriate medium for communication is determined from the available options and is used, in accordance with workplace procedures
	1.2 Communication procedures for opening, passing and receiving messages are implemented, in accordance with workplace procedures
	1.3 Communication equipment is used, in accordance with workplace procedures, Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) guidelines and manufacturers' specifications
	1.4 Limitations of communication system are identified and alternatives are used, in accordance with workplace procedures
2 Monitor communication system	**2.1** Data acquisition is monitored and assessed for quality and action is taken, in accordance with workplace procedures
	2.2 Need for communication assistance is identified and addressed, in accordance with workplace procedures and job requirements
3 Complete documentation	**3.1** Communication equipment problems and status is reported, in accordance with workplace procedures
	3.2 Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

UEPOPS204 Maintain and utilise records

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to maintain and use recorded data. Power generation facility records are maintained and retrieved so that relevant data can be utilised, as required.

Recorded information can include transactions, historical data, personnel details, stakeholder information and compliance obligations. Records should provide evidence of meeting organisational and legal requirements.

Competency in this unit requires the ability to prepare and maintain records and retrieve and utilise records. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Assessment Requirements for UEPOPS204 Maintain and utilise records

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- acquiring and analysing information relevant for recording
- applying Work, Health and Safety (WHS)/Occupational Health and Safety workplace (OHS) procedures including safety working practices
- archiving documents and records
- complying with legislation, industry standards, codes of practice and regulations
- creating, retrieving, storing and maintaining new and existing documents and records
- using a range of document and record management systems including:
  - Data Acquisition and Surveillance (DAS) systems
  - Supervisory Control and Data Acquisition (SCADA) systems
- utilising workplace procedures

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

UEPOPS205 Conduct minor mechanical maintenance

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct a range of minor maintenance functions associated with mechanical equipment. Minor is defined as work that is of lesser seriousness or significance in mechanical maintenance.

Mechanical equipment in a power generation facility can include a variety of plant, machinery and power tools that may contain computers and sensors to monitor and enhance performance.

Competency in this unit requires the ability to plan work, conduct minor maintenance and complete work. Individuals will, in general, work as an operator in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

UEPOPS207 Perform plant lubrication

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to maintain grease, oil levels and quality in all areas of power generating plant. The selection and use of lubricants, as well as the care and operation of lubricating systems, is an essential part of any power generation plant maintenance program.

Competency in this unit requires the ability to plan and prepare plant to conduct lubrication, performing routine checks on plant, conducting plant lubrication and completing documentation. Individuals will, in general, work as an operator, in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare to conduct plant lubrication	**1.1** Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations are identified and applied, in accordance with workplace procedures
	1.2 Work requirements are identified, in accordance with workplace procedures, from relevant personnel and documentation
	1.3 Plant lubricating status is assessed and evaluated from documentation, in accordance with workplace procedures
	1.4 Isolation of power generation plant is arranged, in accordance with workplace procedures
	1.5 Tools, lubricants and Personal Protective Equipment (PPE) are acquired and used, in accordance with workplace procedures
2 Perform routine checks on plant lubrication	**2.1** Power generating plant is checked, in accordance with workplace procedures
	2.2 Power generating plant affected by abnormal lubrication are identified and appropriate personnel are informed, in accordance with workplace procedures
3 Conduct plant lubrication	**3.1** Power generating plant requiring lubrication are cleaned, in accordance with workplace procedures, before lubricating work is carried out
	3.2 Power generating plant is lubricated, in accordance with Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS), manufacturer specifications and workplace procedures
	3.3 Power generating plant is returned to operational condition, in accordance with workplace procedures, to ensure safety of personnel and plant integrity
4 Complete documentation	**4.1** Power generating plant problems, movements, and status is reported in accordance with workplace procedures
	4.2 Documentation is updated, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

Assessment Requirements for UEPOPS207 Perform plant lubrication

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations including:
  - emergency procedures
  - Personal Protective Equipment (PPE)
  - risk control measures
  - safe working practices
  - Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)
- communicating with personnel
- completing documentation
- complying with permit to work requirements
- implementing hazard identification and risk control measures
- lubricating power generating plant including:
  - applying lubricants to machinery and equipment
  - conducting checks of power generating plant lubrication
  - determining problems resulting from excessive or inadequate lubricants
  - preparing and planning power generation lubricating work
- utilising isolation procedures
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- function and types of lubricants and their application
- isolations
- lubrication of plant procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

- manufacturers' specifications and manuals
- permit to work system
- problems resulting from excessive or inadequate lubricants
- typical arrangement of power generation plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - Personal Protective Equipment (PPE)
  - risk control measures
  - safe working practices
  - Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS209 Perform process plant inspections

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct an inspection of electric power generating plant and associated equipment.

An inspection is an organised examination of power generation plant and equipment exposed to conditions that can cause deterioration. Power generation plant and equipment should be inspected at regular intervals.

Competency in this unit requires the ability to inspect power generating plant, gain safe access to work area for inspection, conducting inspections and reporting and/or recording the results. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace, where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare for power plant inspection	**1.1** Maintenance and operating history for inspection is obtained, in accordance with workplace procedures for process plant to be inspected
	1.2 Inspection requirements for power generation plant are determined and confirmed, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations
	1.3 Appropriate inspection check lists recording equipment and personal protective equipment are obtained, in accordance with workplace procedures for process plant to be inspected
	1.4 Availability and access to power generation plant is determined, in accordance with workplace procedures and isolation processes
	1.5 Hazards are identified in preparations for plant inspection and risk control measures are implemented, in accordance with workplace procedures
2 Inspect electric power generating plant	**2.1** Power generation plant is inspected, in accordance with workplace procedures and industry standards
	2.2 Power generation plant is identified and operational status is determined, in accordance with workplace procedures
	2.3 Inspection is conducted using approved methods, in accordance with workplace procedures
	2.4 Inspection requirements are completed, in accordance with workplace procedures
3 Complete documentation	**3.1** Records are updated, in accordance with workplace procedures
	3.2 Documentation is maintained, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS209B Perform process plant inspections.

Assessment Requirements for UEPOPS209 Perform process plant inspections

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- accessing records
- applying inspection procedures and techniques
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) legislation including:
  - emergency procedures
  - Personal Protective Equipment (PPE)
  - risk control measures
  - safe working practices
- complying with legislation, industry standards, codes of practice and regulations preparing for inspection of power generation plant
- conducting equipment isolation procedures
- recording and communicating inspection results
- undertaking inspection of power generation plant and equipment
- using manufacturers’ specifications and manuals
- utilising inspection checklists
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- communication methods for inspection results
- inspection methods and techniques including protocols
- isolations
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system

© Commonwealth of Australia, 2025 Powering Skills Organisation

- power generation inspection checklists
- power generation plant inspection records
- typical arrangements of power generation plant
- Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations including:
  - emergency procedures
  - Personal Protective Equipment(PPE)
  - risk control measures
  - safe working practices
- workplace policies and procedures
- workplace documentation

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPOPS211 Clean plant and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to clean industrial plant, machinery and surrounds associated with electricity generation stations and related surroundings. It may also include the removal of excess, or oil based, soil.

The removal of impurities is required to facilitate repairs, maintenance, refurbishment or the inspection of plant and machinery. Cleaning therefore, is often the first task performed in the maintenance, repair and overhaul of power generation plant.

Competency in this unit requires the ability to plan and prepare for the cleaning of industrial plant and equipment, conduct cleaning and complete work. Individuals will, in general, work as an operator, in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements are identified from work orders and are confirmed with appropriate personnel, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are identified, applied and monitored
	1.3 Resources including cleaning agents, Personal Protective Equipment (PPE) and tools are obtained and inspected for compliance with job specifications, in accordance with Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS) and workplace procedures
	1.4 Work is sequenced and prioritised, in accordance with workplace procedures
	1.5 Potential hazards are identified and prevention and risk control measures are implemented, in accordance with workplace procedures
	1.6 Work area is prepared, in accordance with workplace procedures
2 Conduct industrial plant and equipment cleaning	**2.1** Isolations are confirmed with appropriate personnel, in accordance with workplace procedures
	2.2 Surfaces are applied, where required, with suitable cleaning agent to assist in release of soil or oil residue, in accordance with manufacturer's instructions and workplace procedures
	2.3 Cleaning equipment and accessories are operated, in accordance with manufacturer's instructions and workplace procedures
	2.4 Industrial plant and equipment is cleaned, in accordance with the workplace procedures
	2.5 Residual waste is directed to suitable disposal points, in accordance with workplace procedures and

Assessment Requirements for UEPOPS211 Clean plant and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying material handling procedures
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) legislated requirements including:
  - emergency procedures
  - hazard identification
  - risk control measures
  - safe working practices
  - using Personal Protective Equipment (PPE)
- communicating with personnel
- completing documentation
- complying with legislation, industry standards, codes of practice and regulations
- directing residual waste to disposal points
- handling hazardous materials
- planning cleaning work
- protecting power generation plant or equipment
- selecting appropriate cleaning methods and using cleaning techniques and procedures on industrial plant and equipment
- using manufacturers' specifications and manuals
- using Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)
- working with isolations and permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- cleaning equipment and accessories

UEPOPS232 Transport plant and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to transport power generation plant and equipment.

Road transport is typically used to move light or heavy materials, equipment and power generation plant from one location to another, as required.

Competency in this unit requires the ability to plan and prepare for power generation plant and equipment for transportation, obtaining permits, loading and unloading power generation plant and equipment, securing load, operating transport vehicle and completing documentation. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations, or driving transport vehicles. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS **PERFORMANCE CRITERIA**

© Commonwealth of Australia, 2025 Powering Skills Organisation

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for transportation	**1.1** Safety requirements are identified, in accordance with Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice and workplace procedures
	1.2 Transport requirements are confirmed from work scheduling, in accordance with workplace procedures
	1.3 Characteristics of load are identified, in accordance with workplace procedures, to ensure appropriate loading and unloading procedures are followed
2 Obtain transport permits	**2.1** Permit forms are completed, in accordance with workplace procedures
	2.2 Load is assessed so as not to exceed safe working capacity of vehicle, in accordance with workplace procedures, manufacturers' specifications and regulatory authority's requirements
3 Load/unload plant or equipment	**3.1** Vehicle is inspected prior to loading, in accordance with workplace procedures and manufacturers' specifications
	3.2 Start up, park up and shut down procedures are carried out on transport vehicle, as required, in accordance with manufacturers' specifications and workplace procedures
	3.3 Power generation plant and equipment is loaded and unloaded safely, in accordance with workplace procedures, ensuring no injury to personnel or damage to property, equipment and load
	3.4 Calculations on dimensions including height and width of load and transport vehicle requirements are made for oversized loads, in accordance with workplace procedures
	3.5 Lashings are stored in transport vehicle, in accordance with workplace procedures
	3.6 Load is secured to transport vehicle using appropriate securing equipment and is lashed to anchorage points, in accordance with securing systems, manufacturers' specifications and workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

4 Operate transport vehicle	**4.1**	Preoperational checks are carried out on power generation plant, in accordance with manufacturers' recommendations and workplace procedures
	4.2	Attachments are set at correct height or position, and transport vehicle is driven, in accordance with traffic regulations, manufacturers' specifications and workplace procedures
	4.3	Start up, park up and shut down procedures are carried out on transport vehicle, in accordance with manufacturers' recommendations and workplace
	4.4	Hazards are identified and risk control measures are applied whilst transporting power generation plant and equipment on public roads and at work site, in accordance with workplace procedures
	4.5	Traffic regulations are adhered to, in accordance with workplace procedures
5 Complete documentation	**5.1**	Post operational checks and minor maintenance is carried out on transport vehicle and accessories, in accordance with manufacturers' recommendations and workplace procedures
	5.2	Documentation is updated and transport vehicle abnormalities and status is reported, in accordance with workplace

Assessment Requirements for UEPOPS232 Transport plant and equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- completing documentation using recording procedures
- complying with legislation, industry standards, codes of practice and regulations
- complying with road transport permit requirements
- loading, offloading and transporting power generation plant and equipment
- operating and manoeuvring vehicles
- operational and maintenance procedures
- prestart, start up and shut down procedures
- securing loads using lashing techniques

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- lashing techniques
- legislation, industry standards, codes of practice and regulations
- loading and offloading procedures
- manufacturers' specifications and manuals
- power generation plant and equipment, its location and operation
- prestart, start up and shut down procedures
- road transport permits
- transport equipment capabilities and limitations

© Commonwealth of Australia, 2025 Powering Skills Organisation

- transport operational and maintenance procedures
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace policies and procedures
- workplace documentation

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPOPS237 Perform tool store duties

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to perform operational processes in the storage of tools and consumable items that are used in a power generation facility.

Tool store operations revolve around monitoring and controlling the flow of tools and consumable items into and out of a power generation facility. It includes oversight of tool store operations; maintaining inventory; receiving, storing, and issuing tools, materials, equipment and other items; updating records and compiling store reports.

Competency in this unit requires the ability to plan and prepare for tool store duties, issuing and maintaining tools and associated equipment and completing tool store work. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

UEPOPS238 Maintain battery banks and cells

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the maintenance of all battery cells or banks.

Batteries store energy so that it can be used when needed, batteries can be charged, discharged and recharged several times. The types of equipment supported by batteries in a power generation facility can include emergency lighting systems and alarm and protection systems.

Competency in this unit requires the ability to plan and prepare for battery cell/bank maintenance work, conduct tests on battery cell/bank, analyse results of tests to determine its capability, perform routine maintenance, report abnormalities and documenting work when completed. Individuals will, in general, work as an operator, in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Requirements are identified from work order and is confirmed with appropriate personnel and/or by site inspection, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS)regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are identified, applied and monitored
	1.3 Resources are obtained and inspected for compliance with job specification, in accordance with workplace procedures
	1.4 Relevant plans, drawings and manuals are selected and used, in accordance with workplace procedures
	1.5 Correct size, type and quantity of materials and/or components are obtained and inspected, in accordance with workplace procedures
	1.6 Work is sequenced and prioritised, in accordance with workplace procedures and site requirements
	1.7 Potential hazards and risk control measures are selected and implemented, in accordance with workplace procedures and Material Safety Data Sheets (MSDS) processes
	1.8 Work area is prepared, in accordance with workplace procedures
2 Conduct tests on battery cell/bank	**2.1** Battery cell and/or bank is inspected prior to testing to ensure absence of any damage or defects, in accordance with workplace procedures
	2.2 Tests are carried out to determine battery cell or bank condition, in accordance with workplace procedures
	2.3 Test results are recorded and analysed to determine battery cell and/or bank capabilities, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.4	Testing and measurement instruments are used, in accordance with manufacturers' specifications and workplace procedures
	2.5	Faults found are documented and reported to appropriate personnel, in accordance with workplace procedures
3 Conduct maintenance on battery cell/bank	**3.1**	Isolations are confirmed, where appropriate, in accordance with workplace procedures
	3.2	Battery cell and/or bank is maintained using plans, drawings and manuals in accordance with workplace procedures
	3.3	Cleaning or adjustments are carried out on battery cell and/or bank, in accordance with workplace procedures
	3.4	Maintenance and adjustments are carried out, in accordance with workplace procedures
	3.5	Final inspection is carried out, in accordance with workplace procedures.
4 Complete work	**4.1**	Battery cell and/or bank work is completed and relevant personnel are notified, in accordance with workplace procedures
	4.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	4.3	Battery cell and/or bank tools and equipment are maintained and stored, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

© Commonwealth of Australia, 2025 Powering Skills Organisation

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS238B Maintain battery banks and cells.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPOPS238 Maintain battery banks and cells

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying maintenance techniques to repair faults
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations including:
  - emergency procedures
  - risk control measures
  - safe working procedures
- communicating with personnel
- complying legislation, industry standards, codes of practice and regulations
- interpreting drawings and manufacturers' specifications' and manuals
- maintaining battery cell and/or bank equipment
- reporting findings
- selecting equipment and material
- testing battery cell or bank using diagnostic and data analysis techniques
- using Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)
- using testing and measurement instruments to identify faults and abnormalities
- utilising permit to work system
- working with isolation procedures

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- battery cell or bank testing and maintenance procedures
- battery plant operation
- isolations
- maintenance techniques

© Commonwealth of Australia, 2025 Powering Skills Organisation

- manufacturers' specifications and manuals
- permit to work system
- safety and hazard precautions
- Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)
- testing and fault finding techniques
- workplace documentation
- WHS/OHS legislated requirements including:
  - applying isolation procedures
  - emergency procedures
  - risk control measures
  - safe working procedures
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS240 Operate and monitor fuel supply (coal)

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor coal delivery systems to power generating unit storage bunkers.

A power generating facility that burns fossil fuels is reliant on fuel supply delivery systems to maintain power generation capability. A coal delivery system will consist of plant and/or equipment that requires regular monitoring to ensure smooth operations are maintained.

Competency in this unit requires the ability to plan work, operate coal delivery system plant, analyse coal delivery system plant faults, monitor and inspect coal delivery system plant and completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare fuel delivery plant for operation	**1.1** Safety issues related to operating and monitoring fuel delivery system plant are identified, in accordance with workplace procedures, and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work, fuel delivery plant and resource requirements are identified, in accordance with workplace procedures, from appropriate personnel and documentation
	1.3 Quality assurance requirements are identified, in accordance with workplace procedures
	1.4 Documentation to determine fuel delivery plant status is assessed and evaluated, in accordance with workplace procedures
	1.5 Inspection and field preparation for fuel delivery plant service is carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Operational prerequisites for fuel delivery plant is established, in accordance with workplace procedures and manufacturers' recommendations
	1.7 Sequence for recommissioning of fuel delivery plant is determined, in accordance with workplace procedures and site requirements
2 Operate coal delivery plant	**2.1** Fuel delivery plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Fuel delivery plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective action is taken, in accordance with workplace procedures, when fuel delivery plant response does not meet documentation, plant integrity or personnel safety requirements

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.4	Fuel delivery plant is returned to operational status upon completion of testing, in accordance with workplace procedures
3 Analyse fuel delivery plant faults	**3.1**	Causes of abnormal fuel delivery plant operating conditions are identified, in accordance with workplace procedures, by analysing technical and operational information
	3.2	Corrective action is taken, in accordance with workplace procedures
4 Monitor and inspect fuel delivery plant	**4.1**	Fuel delivery plant to be monitored and inspected is physically identified, in accordance with workplace procedures
	4.2	Fuel delivery plant is monitored and inspected for normal operation or to detect deviations, in accordance with workplace procedures
	4.3	Corrective action is taken, in accordance with workplace procedures
	4.4	Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
5 Complete documentation	**5.1**	Fuel delivery plant problems, movements and status is reported, in accordance with workplace procedures
	5.2	Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

UEPOPS241 Operate and monitor ash and dust disposal plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor ash and dust disposal plant associated with a coal fired power station.

Power generation facilities produce waste that must either be removed, recycled or stored. Ash and dust, produced from coal power generation must be disposed of using an established ash and dust handling system.

Competency in this unit requires the ability to plan work, operate ash and dust disposal plant, test ash and dust disposal plant operation, respond to abnormal ash and dust disposal plant operation, monitor and inspect ash and dust disposal plant and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare disposal plant for operation	**1.1** Safety issues relating to operating and monitoring an ash and dust disposal system are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements are identified, in accordance with workplace procedures, from relevant personnel and documentation
	1.3 Inspection and field preparation for service of ash and dust disposal system is carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.4 Ash and dust disposal plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Sequence for recommissioning of ash and dust disposal plant is determined, in accordance with workplace procedures and site requirements
2 Operate disposal plant	**2.1** Ash and dust disposal plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Ash and dust disposal plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective action is taken, to rectify abnormalities, in accordance with workplace procedures, industry standards and site requirements
3 Test disposal plant operation	**3.1** Operational tests are performed, in accordance with workplace procedures
	3.2 Ash and dust disposal plant is observed for correct operational response, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	3.3	Corrective action is taken, in accordance with workplace procedures, when ash and dust disposal plant response does not meet documentation, plant integrity or personnel safety requirements
	3.4	Ash and dust disposal plant is returned to operational status upon completion of testing, in accordance with workplace procedures
4 Respond to abnormal disposal plant operation	**4.1**	Causes of abnormal plant ash and dust disposal plant operating conditions are identified, in accordance with workplace procedures, by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Ash and dust disposal plant integrity and personnel safety is maintained, in accordance with workplace procedures and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect disposal plant	**5.1**	Ash and dust disposal plant to be monitored and inspected is physically identified, in accordance with workplace procedures
	5.2	Ash and dust disposal plant is monitored and inspected for normal operation or to detect deviations, in accordance with workplace procedures
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
6 Complete documentation	**6.1**	Ash and dust disposal plant problems, abnormalities and status are reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

UEPOPS243 Operate air conditioning plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate and inspect all air conditioning plant.

Air conditioning in power generation facilities refers to systems that cool air and remove humidity from areas filled with heat producing plant and equipment. A complete system of heating, ventilation, and air conditioning is referred to as Heating, Ventilation and Air Conditioning (HVAC).

Competency in this unit requires the ability to plan and prepare work; operate, test, analyse and report on air conditioning plant and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

- permit to work system
- safety and hazard precautions associated with air conditioning plant
- test and fault finding techniques
- typical arrangements of power production plant
- WHS/OHS legislated regulations including:
  - risk control measures
  - safe working practices
  - emergency procedures
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS244 Operate and monitor site services water systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor a power generation facility's site services water system, excluding fixed fire water services.

Water systems are an essential component in power generating facility operations. The smooth operation of a power generating facility's water system must be maintained and optimised to ensure safety and the mitigation of potential impacts from dangerous situations.

Competency in this unit requires the ability to plan work, operate water system plant, test water system plant operation, respond to abnormal water system plant operation, monitor and inspect water system plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues relating to operating and monitoring water system plant are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements are identified from appropriate personnel and documentation, in accordance with workplace procedures
	1.3 Documentation to determine water system plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection and field preparations of water system plant service is carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Water system plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of water system plant is determined, in accordance with workplace procedures and site requirements
2 Operate water system plant	**2.1** Water system plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Water system plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective actions are taken to rectify abnormalities, in accordance with workplace procedures and manufacturers' recommendations
3 Test water system plant operation	**3.1** Operational tests are performed, in accordance with workplace procedures
	3.2 Water system plant is observed for correct operational

© Commonwealth of Australia, 2025 Powering Skills Organisation

		response, in accordance with workplace procedures
	3.3	Corrective action is taken, in accordance with workplace procedures, when water system response does not meet documentation, plant integrity or personnel safety requirements
	3.4	Water system plant is returned to operational status upon completion of testing, in accordance with workplace procedures
4 Analyse water system plant faults	**4.1**	Causes of abnormal water system plant operating conditions are identified, in accordance workplace procedures, and by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Water system plant integrity and personnel safety are maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect water system plant	**5.1**	Water system plant to be monitored and/or inspected is physically identified, in accordance with workplace procedures
	5.2	Water system plant is monitored and/or inspected for normal operation or to detect deviations, in accordance with workplace procedures
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
6 Complete documentation	**6.1**	Water system plant problems, movements and status are reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Assessment Requirements for UEPOPS244 Operate and monitor site services water systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing water system plant faults using analysis techniques and tools
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with personnel
- completing documentation using recording procedures
- complying with legislation, industry standards, codes of practice and regulations
- identifying water system plant status
- interpreting manufacturers' specifications and manuals
- monitoring and inspecting water system plant operations
- operating water system plant
- organising resources
- preparing and planning work
- preparing plant and equipment for operation
- recognising and responding to abnormal water system plant operating conditions
- testing water system plant operationally using diagnostic and test techniques
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- inspection and monitoring plant water system
- legislation, industry standards, codes of practice and regulations

© Commonwealth of Australia, 2025 Powering Skills Organisation

- manufacturers' manuals and specifications
- permit to work system
- safe operating principles
- water system plant and equipment, its location and operating parameters
- water system plant status including the identification of faults and abnormalities
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPOPS245 Conduct chemical batching operations

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct mixing of chemicals for the treatment of a primary substance.

A chemical that is needed in the workplace in a small amount (i.e. a speciality chemical) is usually made through using a batching process. Considerable care with all compounds and substances must be undertaken when conducting chemical batching operations due to toxicity.

Competency in this unit requires the ability to plan work, perform chemical batching and the completion of work. Individuals will, in general, work as an operator in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS **PERFORMANCE CRITERIA**

© Commonwealth of Australia, 2025 Powering Skills Organisation

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Work requirements are identified and confirmed with appropriate personnel, in accordance with workplace procedures
	1.2 Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are identified, applied and monitored
	1.3 Potential hazards are identified and risk control measures are selected, in accordance with workplace procedures
	1.4 Resources, including Material Data Safety Sheet (MSDS) and Personal Protective Equipment (PPE), are inspected and used, in accordance with workplace procedures
2 Perform chemical batching	**2.1** Staff are notified on commencement and completion of chemical batching work, in accordance with workplace procedures
	2.2 Chemical requirements for batching is calculated, in accordance with workplace procedures and job requirement
	2.3 Correct chemical is added to tank or chemical batching plant, in accordance with workplace procedures
	2.4 Demineralised water is added to chemical batch to correct level, in accordance with workplace procedures
	2.5 Mixing device is operated, in accordance with workplace procedures
	2.6 Work site is left clean and safe, in accordance with workplace procedures to ensure personnel safety and power generating plant integrity
3 Complete documentation	**3.1** Chemical batching problems are reported, in accordance with workplace procedures
	3.2 Documentation is updated, in accordance with workplace procedures

UEPOPS246 Operate waste and contaminated water plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor waste and contaminated water plant associated with a power generating facility.

Wastewater treatment covers the mechanisms and processes used to treat wastewater that is produced as a by-product of power generation activities. Wastewater from generating plants can contain significant levels of metals, flue-gas desulfurization, fly ash, bottom ash and flue gas mercury. After treatment, the treated wastewater can be either reused or released.

Competency in this unit requires the ability to plan and prepare waste and contaminated water plant; operate, test, analyse and inspect plant; report on abnormalities and complete documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPOPS247 Operate and monitor an internal combustion single fuel reciprocating engine

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor single fuel internal combustion reciprocating engines.

Typically, an internal combustion engine uses fossil fuels such as petrol, gas, diesel or oil. Internal combustion reciprocating engines in the form of combustion turbines drive the largest electric generators.

Competency in this unit requires the ability to plan work, operate internal combustion single fuel reciprocating engine plant, test internal combustion single fuel reciprocating engine plant operations, analyse internal combustion single fuel reciprocating engine plant faults, monitor and inspect internal combustion single fuel reciprocating engine plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generating facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues related to operating and monitoring internal combustion dual fuel reciprocating engines are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements are identified, in accordance with workplace procedures, from appropriate personnel and documentation
	1.3 Documentation to determine internal combustion dual fuel reciprocating engine plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection and field preparations for internal combustion dual fuel reciprocating engine plant service are carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Internal combustion dual fuel reciprocating engine plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of internal combustion dual fuel reciprocating engine plant is determined, in accordance with workplace procedures and site requirements
2 Operate internal combustion dual fuel reciprocating engine plant	**2.1** Internal combustion dual fuel reciprocating engine plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Internal combustion dual fuel reciprocating engine plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal

© Commonwealth of Australia, 2025 Powering Skills Organisation

		operating conditions
	2.3	Corrective actions are taken to rectify internal combustion dual fuel reciprocating engine plant abnormalities, in accordance with workplace procedures and manufacturers' recommendations
3 Change fuel type during operation	**3.1**	Changeover of fuel type is monitored and observed, in accordance with workplace procedures, to detect deviations from expected results
	3.2	Corrective actions are taken, in accordance with workplace procedures and manufacturers' recommendations
4 Test internal combustion dual fuel reciprocating engine plant operation	**4.1**	Operational tests are performed, in accordance with workplace procedures
	4.2	Internal combustion dual fuel reciprocating engine plant is observed, in accordance with workplace procedures, for correct operational response
	4.3	Corrective action is taken, in accordance with workplace procedures, when response does not meet with documentation, plant integrity or personnel safety requirements
	4.4	Appropriate personnel are notified, in accordance with workplace procedures, when defects are detected
5 Analyse internal combustion dual fuel reciprocating engine plant faults	**5.1**	Cause of abnormal internal combustion dual fuel reciprocating engine plant operating conditions are identified, in accordance with workplace procedures, by analysing technical and operational information
	5.2	Corrective action is taken, in accordance with workplace procedures
	5.3	Internal combustion dual fuel reciprocating engine plant integrity and personnel safety is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
6 Monitor and inspect internal combustion dual fuel reciprocating engine plant	**6.1**	Internal combustion dual fuel reciprocating engine plant to be monitored and inspected is physically identified, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	6.2	Internal combustion dual fuel reciprocating engine plant is monitored and inspected for normal operation or to detect deviations, in accordance with workplace procedures
	6.3	Corrective action is taken, in accordance with workplace procedures
	6.4	Appropriate personnel are notified, in accordance with workplace procedures, when defects are detected
7 Complete documentation	**7.1**	Internal combustion dual fuel reciprocating engine plant problems, abnormalities and status are reported in accordance with workplace procedures
	7.2	Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS248B Operate and monitor an internal combustion dual fuel reciprocating engine.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPOPS248 Operate and monitor an internal combustion dual fuel reciprocating engine

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing internal combustion dual reciprocating engine plant faults using data analysis techniques and tools
- applying dual fuel engine operational knowledge
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- changing fuel type during operation
- communicating with personnel
- completing documentation
- complying with legislation, industry standards, codes of practice and regulations
- identifying internal combustion dual reciprocating engine plant status
- interpreting manufacturers' manuals and specifications
- monitoring and inspecting internal combustion dual reciprocating engine plant operations
- operating duel fuel engines
- preparing and planning work
- preparing internal combustion dual reciprocating engine plant and/or equipment for operation
- recognising and responding to abnormal internal combustion dual reciprocating engine plant operating conditions
- testing internal combustion dual reciprocating engine plant operationally using diagnostic and test techniques
- utilising fuel changeover equipment and/or systems
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the

© Commonwealth of Australia, 2025 Powering Skills Organisation

requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- internal combustion dual reciprocating engine plant and equipment, its location and operating parameters
- internal combustion dual reciprocating engine plant status including fuel changeover equipment
- internal combustion reciprocating engine types and characteristics
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe work practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS249 Liaise with stakeholders

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to communicate with external and internal stakeholders.

Communication with stakeholders is about exchanging information, both verbal and non-verbal, with various internal and external personnel and organisations who may have an interest in the outcomes or activities of the workplace. Communicating with internal and external stakeholders requires the application of methods and techniques that enhance participation.

Competency in this unit requires the ability to plan and prepare for communication, communicate in writing, communicate orally, use communications systems and complete documentation. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS **PERFORMANCE CRITERIA**

© Commonwealth of Australia, 2025 Powering Skills Organisation

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare for communication	**1.1** Communication requirements are identified and confirmed, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational, Health and Safety (OHS) regulations
	1.2 Appropriate medium and tools for communication with stakeholders are determined
	1.3 Urgent or important information for stakeholders is provided
2 Communicate in writing	**2.1** Written communication is structured to provide or request information
	2.2 Format is identified, from analysis of available options and current circumstances
	2.3 Written communication is concisely and logically presented
	2.4 Information dissemination protocols and procedures are adhered to, in accordance with workplace policy
3 Communicate orally	**3.1** Oral communication for stakeholders is structured to provided or request information
	3.2 Oral communication is conveyed concisely, logically and appropriately
	3.3 Intent of oral communication is confirmed
	3.4 Information dissemination protocols and procedures are adhered to, in accordance with workplace policy
4 Use communications systems	**4.1** Communications system is used, in accordance with workplace procedures and manufacturers' recommendations
	4.2 Communications system, is maintained and updated, in accordance with workplace procedures
5 Complete documentation	**5.1** Communication equipment problems are reported, in accordance with workplace procedures
	5.2 Documentation is updated, in accordance with workplace procedures

UEPOPS251 Conduct routine wind turbine maintenance

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct a range of routine maintenance functions associated with wind turbines. Routine maintenance functions associated with wind turbines are required to ensure the smooth operation of mechanical plant and equipment.

Competency in this unit requires the ability to plan for plant in-service checks, carry out in-service mechanical checks and complete work. Individuals will, in general, work as an operator in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Elements and Performance Criteria

ELEMENTS **PERFORMANCE CRITERIA**

© Commonwealth of Australia, 2025 Powering Skills Organisation

Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Work requirements are identified, in accordance with workplace procedures, from work orders and are confirmed with appropriate personnel or by site inspection
	1.2 Work, Health and Safety (WHS)Occupational, Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are identified, applied and monitored
	1.3 Resources are obtained and inspected, in accordance with workplace procedures, for compliance with job specification
	1.4 Plans, drawings and manuals are selected, in accordance with workplace procedures
	1.5 Correct size, type and quantity of materials and components are obtained and inspected, in accordance with workplace procedures
	1.6 Work sequenced and prioritised, in accordance with workplace procedures and site requirements
	1.7 Potential hazards are identified and risk control measures are selected, in accordance with workplace procedures
	1.8 Work area is prepared, in accordance with workplace procedures
2 Conduct routine maintenance	**2.1** Isolations are confirmed, where appropriate, in accordance with workplace procedures
	2.2 Routine maintenance on wind turbine is conducted, in accordance with workplace procedures and site requirements
	2.3 Minor adjustments of wind turbine are undertaken, in accordance with workplace procedures, maintenance schedules and site requirements
	2.4 Wind turbine faults are reported to appropriate personnel, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

3 Complete work	**3.1** Maintenance work is completed and appropriate personnel are notified, in accordance with workplace procedures
	3.2 Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	3.3 Tools and equipment are maintained and stored, in accordance with workplace procedures
	3.4 Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

UEPOPS252 Undertake local systems operations

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate power generating plant as a local systems operation, in conjunction with coordinated systems, under the control of appropriate authorised personnel.

The operation, configuration and implementation of power generation systems and plant should be considered and reviewed when undertaking local systems operations.

Competency in this unit requires the ability to plan and prepare work, operate plant and complete work. Individuals will, in general, work as an operator, in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPOPS301 Conduct single energy source isolation procedures for permit to work

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct single energy source isolation procedures for permits to work.

A permit to work system is a formal method used to control certain types of work that can be potentially hazardous. A permit to work specifies the work to be completed, the precautions to be taken and the timeframe for completion.

Competency in this unit requires the ability to plan and prepare for isolation, de-isolation and restoration, perform isolation and perform de-isolation and restoration. Individuals will, in general, work as an operator in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace procedures

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPOPS309 Operate and monitor air conditioning plant and ventilation systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate and monitor air conditioning plant, ventilation systems and associated equipment.

Air conditioning is used to cool and/or dehumidify a variety of plant that is heat producing in power generation facilities. Ventilation is the process of changing or replacing air to control temperatures or remove a combination of moisture, odour, smoke, heat, dust, airborne bacteria, carbon dioxide or to replenish oxygen.

Competency in this unit requires the ability to plan work, operate and monitor air conditioning plant and ventilation systems, test air conditioning plant and ventilation system operations, identify air conditioning plant and ventilation system faults, monitor and inspect air conditioning plant and ventilation system and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Safety issues related to operating and monitoring air conditioning plant and ventilation systems are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work, air conditioning plant and ventilation system and resource requirements are identified, in accordance with workplace procedures, and from relevant personnel and documentation
	1.3 Quality assurance requirements are identified, in accordance with workplace procedures
	1.4 Documentation to determine air conditioning plant and ventilation system status is assessed and evaluated, in accordance with workplace procedures
	1.5 Inspection and field preparation for air conditioning plant and ventilation system service is carried out, in accordance with workplace and manufacturers' procedures
	1.6 Air conditioning plant and ventilation system operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.7 Sequence and air conditioning plant and ventilation system requirements for operation is determined, in accordance with workplace procedures and site requirements
	1.8 Reporting requirements are carried out, in accordance with workplace procedures
2 Perform operation and monitoring of air	**2.1** Air conditioning plant and ventilation system is operated and shut down, in accordance with workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

conditioning equipment and ventilation systems		procedures and manufacturers' operating recommendations
	2.2	Air conditioning plant and ventilation system is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3	Air conditioning plant and ventilation system performance and quality is monitored, in accordance with workplace procedures, including temperature and airflow humidity
	2.4	Corrective actions are taken to rectify abnormalities, in accordance with workplace procedures, industry standards and site requirements
3 Test air conditioning and ventilation system plant operation	**3.1**	Operational tests are performed, in accordance with workplace procedures
	3.2	Corrective action is taken, in accordance with workplace procedures, when response does not meet with documentation, air conditioning and ventilation system plant integrity or personnel safety requirements
	3.3	Air conditioning plant and ventilation system is returned to required operational status upon completion of testing, in accordance with workplace procedures
4 Identify air conditioning and ventilation system plant faults	**4.1**	Causes of abnormal air conditioning and ventilation system plant operating conditions are identified, in accordance with workplace procedures, and by analysis of technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Air conditioning plant and ventilation system integrity and personnel safety is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect air conditioning and ventilation system plant	**5.1**	Air conditioning plant and ventilation system to be monitored and inspected is physically identified, in accordance with workplace procedures
	5.2	Air conditioning plant and ventilation system is monitored and inspected, in accordance with workplace

© Commonwealth of Australia, 2025 Powering Skills Organisation

		procedures, for normal operation or to detect deviations
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
6 Complete documentation	**6.1**	Air conditioning plant and ventilation system problems, movements and status are reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS309B Operate and monitor air conditioning plant and ventilation systems.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPOPS309 Operate and monitor air conditioning plant and ventilation systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with personnel
- completing documentation using recording procedures
- identifying air conditioning plant and ventilation system status
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring and inspecting air conditioning plant and ventilation system
- operating air conditioning plant and ventilation system including temperature and air flow using data analysis techniques and tools
- operating and monitoring air conditioning plant, equipment and ventilation system
- organising resources
- preparing air conditioning plant and ventilation system for operation
- preparing and planning work
- recognising and responding to abnormal faults in air conditioning plant and ventilation system operating conditions
- testing air conditioning plant and ventilation system operation using diagnostic test techniques and procedures
- utilising repair techniques and procedures
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes

© Commonwealth of Australia, 2025 Powering Skills Organisation

knowledge of:

- air conditioning and ventilation system plant status manufacturers' specifications and manuals
- legislation, industry standards, codes of practice and regulations
- permit to work system
- typical arrangements of power production plant
- plant and equipment, its location and operating parameters including:
  - air conditioner systems
  - ventilation systems
  - refrigerant gases
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS310 Operate bulk coal handling plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to address the storage, reclaiming and despatching of bulk coal. It also encompasses monitoring any associated mobile bulk coal handling plant operations.

Bulk coal handling plant is used to convey coal from rail transport wagons to boilers or storage bunkers. They are also used to process raw coal, to crush and stack coal to feed directly into power generation facilities.

Competency in this unit requires the ability to plan and prepare work, operate bulk coal handling plant, inspect, test, analyse and report bulk coal handling plant faults and complete documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues are identified, in accordance with Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards and workplace procedures
	1.2 Work, bulk coal handling plant and resource requirements are identified from appropriate personnel and documentation, in accordance with workplace procedures
	1.3 Quality assurance requirements recognised and adhered to, in accordance with workplace procedures and industry standards
	1.4 Basic mineralogy information is applied, in accordance with workplace procedures and site requirements
	1.5 Work schedule is consistent with job requirements, in accordance with workplace procedures
	1.6 Pad is prepared for coal stockpiling, including removal of contaminants and drainage, in accordance with workplace procedures
	1.7 Preoperational checks are carried out on bulk coal handling plant, in accordance with manufacturers' recommendations and workplace procedures
	1.8 Sequence for recommissioning of bulk coal handling plant is determined, in accordance with workplace procedures
2 Conduct operation of bulk coal handling plant	**2.1** Start up, park up and shut down procedures are carried out, in accordance with manufacturers' recommendations, workplace procedures and site specific requirements
	2.2 Bulk coal handling plant is operated, in accordance with workplace procedures and manufacturers' recommendations
	2.3 Bulk coal handling plant is monitored, in accordance with workplace procedures, to detect deviations from

		normal operating conditions
	2.4	Corrective actions are taken to rectify bulk coal handling plant abnormalities, in accordance with industry standards and workplace procedures
	2.5	Bulk coal handling plant to be removed from service is identified and isolated, in accordance with workplace procedures
	2.6	Inspection and fault finding are carried out, in accordance with manufacturers' recommendations and workplace procedures
	2.7	Coal is placed or bunkered down in predetermined stockpile location, in accordance with workplace procedures
	2.8	Reclaim specifications are received, despatch area is notified and equipment is made ready, in accordance with workplace procedures
	2.9	Specified coal is blended, loaded, sampled and despatched, in accordance with workplace procedures
3 Test bulk coal handling plant operation	**3.1**	Tests are performed, in accordance with workplace procedures
	3.2	Bulk coal handling plant is observed for correct operational response, in accordance with workplace procedures
	3.3	Corrective action is taken when response does not meet with documentation, workplace procedures, bulk coal handling plant integrity or personnel safety requirements
	3.4	Bulk coal handling plant is returned to required operational status upon completion of testing, in accordance with workplace procedures
4 Analyse bulk coal handling plant faults	**4.1**	Causes of abnormal bulk coal handling plant operating conditions are identified, in accordance with workplace procedures, by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Supplementary personnel are arranged for investigation of identified operational abnormalities, if required, in

UEPOPS311 Operate fabric filter dust collection plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor fabric filter dust collection plant associated with coal fired power stations.

Dust collection plant is used to enhance the quality of air released from power generation processes. It typically consists of a blower, dust filter, a filter cleaning system and a dust receptacle or dust removal system.

Competency in this unit requires the ability to plan and prepare work, operate fabric filter dust collection plant, test, analyse, monitor, inspect and report dust collection plant faults and complete documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPOPS312 Operate and monitor fuel supply

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor fuel supply from source to recipient unit storage.

A fuel system will consist of a variety of plant and equipment that requires regular monitoring to ensure smooth operations are maintained in the fuel delivery process.

Competency in this unit requires the ability to plan work, operate fuel supply plant, test fuel supply plant, analyse fuel supply plant faults, monitor and inspect fuel supply plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility, as a fuel operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPOPS313 Operate and monitor boiler draught system

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor boiler draught equipment.

Boiler draught is defined as the difference between atmospheric pressure and the pressure existing in a furnace or the flue gas passage of a boiler. Boiler draught is important to the smooth operation of all the systems in a power generating facility.

Competency in this unit requires the ability to plan work, operate boiler draught system plant, test boiler draught system plant, analyse boiler draught system plant faults, monitor and inspect boiler draught system plant and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for boiler draught system operation	**1.1** Safety issues related to operating and monitoring boiler draught system plant are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements including work to permit are identified, in accordance with workplace procedures, from appropriate personnel and documentation
	1.3 Documentation to determine boiler draught system plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection, preoperational checks and field preparations for boiler draught system plant service are carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Boiler draught system plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of boiler draught system plant is determined to suit existing circumstances in accordance with workplace procedures and site requirements
2 Operate boiler draught system plant	**2.1** Boiler draught system plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Boiler draught system plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective actions are taken to rectify abnormalities, in accordance with workplace procedures, industry standards and site requirements
3 Test plant boiler draught system operation	**3.1** Operational tests are performed, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	3.2	Boiler draught system plant is observed for correct operational response, in accordance with workplace procedures
	3.3	Corrective action is taken, in accordance with workplace procedures, when response does not meet with documentation, boiler draught system plant integrity or personnel safety requirements
	3.4	Boiler draught system plant is returned to required operational status upon completion of testing, in accordance with workplace procedures
4 Analyse boiler draught system plant faults	**4.1**	Causes of abnormal boiler draught system plant operating conditions are identified, in accordance with workplace procedures, by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Boiler draught system plant integrity and personnel safety is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect boiler draught system plant	**5.1**	Boiler draught system plant to be monitored and/or inspected is physically identified, in accordance with workplace procedures
	5.2	Boiler draught system plant is monitored and/or inspected, in accordance with workplace procedures, for normal operation or to detect deviations
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified, in accordance with workplace procedures, when defects are detected
6 Complete documentation	**6.1**	Boiler draught system plant problems, movements and status are reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS313B Operate and monitor boiler draught system.

Links

Companion Volume implementation guides are found in VETNet - https://vetnet.gov.au/Pages/TrainingDocs.aspx?q=1715b9fa-e7bd-441c-bb8d-cf22c9c825a8

Assessment Requirements for UEPOPS313 Operate and monitor boiler draught system

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing boiler draught system plant to identify and respond to abnormal boiler draught system plant operating conditions
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including
  - emergency procedures
  - safe working practices
  - risk control measures
- communicating with personnel
- completing documentation
- executing corrective actions for faults
- identifying boiler draught system plant faults using data analysis techniques and tools
- identifying boiler draught system plant status
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications, drawings and manuals
- isolating boiler draught system
- monitoring and inspecting boiler draught system plant operation including combustion, fans, air flow and control
- operating boiler draught system plant
- organising resources
- preparing boiler draught system plant and/or equipment for operation and planning work
- testing boiler draught system plant operation using diagnostic and test techniques
- using permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- boiler draught system plant and equipment, its location and operating parameters including combustion, fans, air flow and control
- boiler draught system plant status
- isolations requirements
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications, drawings and manuals
- permit to work system
- typical arrangements of power production plant
- typical boiler draught system faults and corrective actions
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS314 Operate and monitor fuel firing plant (gas or oil)

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor fuel firing plant (gas or oil).

Regular inspections and monitoring of fuel firing plant is required to ensure the safe operation of gas and/or oil firing systems.

Competency in this unit requires the ability to plan work, operate fuel firing (gas or oil) plant, test fuel firing plant, analyse fuel firing plant faults, monitor and inspect fuel firing plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues related to operating and monitoring fuel firing plant are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements are identified, in accordance with workplace procedures, from relevant personnel and documentation
	1.3 Documentation to determine fuel firing plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection, preoperational tests and field preparations for fuel firing plant service are carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Fuel firing plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of fuel firing plant is determined, in accordance with workplace procedures and site requirements
2 Operate fuel firing plant	**2.1** Fuel firing plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Fuel firing plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective actions are taken to rectify fuel firing plant abnormalities, in accordance with workplace procedures and manufacturers' recommendations
3 Test fuel firing plant operation	**3.1** Operational tests are performed, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	3.2	Fuel firing plant is observed, in accordance with workplace procedures, for correct operational response
	3.3	Corrective action is taken, in accordance with workplace procedures, when response does not meet with documentation, fuel firing plant integrity or personnel safety requirements
	3.4	Fuel firing plant is returned to required operational status upon completion of test, in accordance with workplace procedures
4 Analyse fuel firing plant faults	**4.1**	Causes of abnormal fuel firing plant operating conditions are identified, in accordance with workplace procedures, and by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Fuel firing plant integrity and personnel safety is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect fuel firing plant	**5.1**	Fuel firing plant to be monitored and inspected is physically identified, in accordance with workplace procedures
	5.2	Fuel firing plant is monitored and inspected for normal operation or to detect deviations, in accordance with workplace procedures
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
6 Complete documentation	**6.1**	Fuel firing plant problems, movements, and status are reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

UEPOPS315 Operate and monitor fuel firing plant (coal)

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor fuel firing plant (coal).

Regular inspections and monitoring of fuel firing plant is required to ensure the safe operation of coal firing system.

Competency in this unit requires the ability to plan work, operate fuel firing (coal) plant, test fuel firing plant, analyse fuel firing plant faults, monitor and inspect fuel firing plant and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

UEPOPS316 Operate and monitor boiler steam/water cycle

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor a boiler steam and/or water cycle.

The relationship of components within the boiler and steam and/or water cycle in a power generating unit system, and the effect of adjustments made to components, can impact the efficiency and safety of a power generating facility's operation.

Competency in this unit requires the ability to plan work, operate boiler steam and/or water cycle plant, test boiler steam and/or water cycle plant, analyse boiler steam and/or water cycle plant faults, monitor and inspect boiler steam and/or water cycle plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

UEPOPS317 Operate and monitor fixed fire protection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor fixed fire protection systems.

Fixed fire protection systems are engineered sets of components that work together to detect fires, alert occupants and extinguish fires. Fixed fire protection systems use a combination of dry chemicals and wet agents to suppress fires.

Competency in this unit requires the ability to plan work, operate fixed fire protection system plant, test fixed fire protection system plant, analyse fixed fire protection system plant faults, monitor and inspect fixed fire protection system plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generating facility as a fire systems operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS317B Operate and monitor fixed fire protection systems.

Links

Assessment Requirements for UEPOPS317 Operate and monitor fixed fire protection systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing fixed fire protection system plant faults
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe work practices
- communicating with personnel
- completing documentation
- confirming operational status of firefighting and fire prevention equipment
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring and inspecting fixed fire protection system plant operation
- operating fixed fire protection system plant
- preparing and planning work
- testing fixed fire protection system plant operationally

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- fire protection system testing
- fire suppression systems
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- operational status of firefighting and fire prevention equipment
- WHS/OHS legislated requirements including:

© Commonwealth of Australia, 2025 Powering Skills Organisation

  - emergency procedures
  - risk control measures
  - safe work practices
- workplace documentation including reports, records and logs
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS318 Operate and monitor compressed gas systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate compressed gas systems excluding air steam.

Compressed gas is gas contained under pressure, usually in a cylinder. Typically, a compressed gas system in a power generation facility will consist of a bulk compressed gas supply system rather than individual cylinders.

Competency in this unit requires the ability to plan work, operate compressed gas system plant, test compressed gas system plant, analyse compressed gas system plant faults, monitor and inspect compressed gas system plant and the completion all documentation. Individuals will, in general, work under supervision, in a power generation facility as a maintenance operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues related to operating and monitoring compressed gas system plant are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements are identified, in accordance with workplace procedures, from appropriate personnel and documentation
	1.3 Documentation to determine compressed gas system plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection for compressed gas system plant service is carried out, in accordance with workplace procedures and manufacturers' operational requirements
	1.5 Compressed gas system plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of compressed gas system plant is determined, in accordance with workplace procedures and site requirements
2 Operate compressed gas system plant	**2.1** Compressed gas system plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Compressed gas system plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective actions are taken to rectify compressed gas system plant abnormalities, in accordance with workplace procedures and site requirements
	2.4 Compressed gas system plant is identified and removed from service, in accordance with workplace procedures and site requirements

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.5	Corrective actions are taken, in accordance with workplace procedures when compressed gas system plant abnormalities are identified during removal from service
3 Test compressed gas system plant operation	**3.1**	Operational tests are performed, in accordance with workplace procedures
	3.2	Compressed gas system plant is observed for correct operational response, in accordance with workplace procedures
	3.3	Corrective action is taken, in accordance with workplace procedures, when response does not meet with documentation, plant integrity or personnel safety requirements
	3.4	Compressed gas system plant is returned to required operational status upon completion of test, in accordance with workplace procedures
4 Analyse compressed gas system plant faults	**4.1**	Causes of abnormal compressed gas system plant operating conditions are identified, in accordance with workplace procedures, and by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Compressed gas system plant integrity and personnel safety is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect compressed gas system plant	**5.1**	Compressed gas system plant to be monitored and/or inspected is physically identified, in accordance with workplace procedures
	5.2	Compressed gas system plant is monitored and/or inspected, in accordance with workplace procedures, for normal operation or to detect deviations
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified, in accordance with workplace procedures, when defects are detected
6 Complete documentation	**6.1**	Compressed gas system plant problems, movements and

UEPOPS319 Operate and monitor gas production plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor gas producing plant. Gas production plant is used for combustible gases which are fed into power turbines.

Competency in this unit requires the ability to plan work, operate compressed gas production plant, test compressed gas production plant, analyse compressed gas production plant faults, monitor and inspect compressed gas production plant and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

UEPOPS320 Operate and monitor compressed air systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate compressed air systems.

Compressed air is defined as air kept under a pressure that is greater than the atmospheric pressure. Compressed air is critical to the operation of plant in power generating facilities, such as air operated control valves and fabric filter cleaning systems.

Competency in this unit requires the ability to plan work, operate compressed air system plant, test compressed air system plant, analyse compressed air system plant faults, monitor and inspect compressed air system plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generating facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

UEPOPS321 Operate and monitor water treatment plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor water treatment and purification plant.

Water treatment plants are typically used to clean waste water for reuse or discharge in power generation facilities. The water treatment process involves the purification of water through the removal of undesirable chemicals, contaminants, solids and gases.

Competency in this unit requires the ability to plan work, operate water treatment plant, test water treatment plant, analyse water treatment plant faults, monitor and inspect water treatment plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring and inspecting water treatment plant operation
- operating water treatment plant
- organising resources
- planning and preparing work
- preparing water treatment plant or equipment for operation
- recognising and responding to abnormal water treatment plant operating conditions
- testing water treatment plant operationally using diagnostic and test techniques
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals

© Commonwealth of Australia, 2025 Powering Skills Organisation

- permit to work system
- typical arrangements of power production plant
- water treatment plant and equipment, its location and operating parameters
- water treatment plant status
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS322 Operate and monitor alkalinity reduction plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor alkalinity reduction plant which includes cooling tower water dosing equipment.

Alkalinity is a measure of the bicarbonates and carbonates in water i.e. a measure of limestone content in water. Alkalinity can affect the chlorine residual in power generation plant effluent.

Competency in this unit requires the ability to plan work, operate alkalinity reduction plant, test alkalinity reduction plant, analyse alkalinity reduction plant faults, monitor and inspect alkalinity reduction plant and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practices

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues related to the operating and monitoring of alkalinity reduction plant are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements are identified, in accordance with workplace procedures, from appropriate personnel and documentation
	1.3 Documentation to determine alkalinity reduction plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection and field preparation for alkalinity reduction plant service is carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Alkalinity reduction plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of alkalinity reduction plant is determined, in accordance with workplace procedures and site requirements
2 Operate alkalinity reduction plant	**2.1** Alkalinity reduction plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Alkalinity reduction plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective actions are taken to rectify abnormalities in alkalinity reduction plant, in accordance with workplace procedures and manufacturers' recommendations
	2.4 Alkalinity reduction plant is identified and removed from service, in accordance with workplace procedures and site requirements

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.5	Corrective actions are taken, in accordance with workplace procedures, when abnormalities are identified during the removal from service of alkalinity reduction plant
3 Test alkalinity reduction plant operation	**3.1**	Operational tests are performed, in accordance with workplace procedures
	3.2	Alkalinity reduction plant is observed for correct operational response, in accordance with workplace procedures
	3.3	Corrective action is taken, in accordance with workplace procedures, when response does not meet with documentation, alkalinity reduction plant integrity or personnel safety requirements
	3.4	Alkalinity reduction plant is returned to required operational status upon completion of testing, in accordance with workplace procedures
4 Analyse alkalinity reduction plant faults	**4.1**	Causes of abnormal alkalinity reduction plant operating conditions are identified, in accordance with workplace procedures, and by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Alkalinity reduction plant integrity, and personnel safety, is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect alkalinity reduction plant	**5.1**	Alkalinity reduction plant to be monitored or inspected is physically identified, in accordance with workplace procedures
	5.2	Alkalinity reduction plant is monitored or inspected, in accordance with workplace procedures, for normal operation or to detect deviations
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
6 Complete documentation	**6.1**	Alkalinity reduction plant problems, movements and

© Commonwealth of Australia, 2025 Powering Skills Organisation

status are reported, in accordance with workplace procedures

6.2 Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS322B Operate and monitor alkalinity reduction plant.

Assessment Requirements for UEPOPS322 Operate and monitor alkalinity reduction plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing alkalinity reduction plant faults using data analysis techniques and tools
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - chemical use and hazards
  - emergency procedures
  - risk control measures
  - safe work practices including use of Safety Data Sheets (SDS)/Material Safety Data Sheets (MSDS)
- communicating with personnel
- completing documentation
- identifying alkalinity reduction plant status
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers specifications and manuals
- monitoring and inspecting alkalinity reduction plant operation
- operating alkalinity reduction plant
- organising resources
- planning and preparing work
- preparing alkalinity reduction plant and/or equipment for operation
- recognising and responding to abnormal alkalinity reduction plant operating conditions
- testing alkalinity reduction plant operations using diagnostic and test techniques
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- alkalinity reduction plant and equipment, its location and operating parameters including

UEPOPS323 Operate and monitor reverse osmosis plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor reverse osmosis plant.

Reverse osmosis is a water purification technology that uses a semipermeable membrane to remove dissolved inorganic solids such as salts, ions, molecules and larger particles from water.

Competency in this unit requires the ability to plan work, operate reverse osmosis plant, test reverse osmosis plant, analyse reverse osmosis plant faults, monitor and inspect reverse osmosis plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

UEPOPS324 Operate and monitor brine concentrator plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor brine concentrator plant.

Power generation facilities typically produce waste water that contains minerals and solids. Brine concentrators are used to remove these impurities as part of the waste water management and treatment process.

Competency in this unit requires the ability to plan work, operate brine concentrator plant, test brine concentrator plant, analyse brine concentrator plant faults, monitor and inspect brine concentrator plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

UEPOPS325 Operate and monitor water quality monitoring systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate and monitor water quality monitoring systems in a power generation facility. These systems include all analytical devices used to monitor process chemical conditions.

Water quality refers to the chemical, physical, biological and or radiological characteristics of water. Water quality is a crucial factor for avoiding corrosion and scaling of turbines, boilers and pipes in power generating plant.

Competency in this unit requires the ability to plan work, operate water quality monitoring systems plant, test water quality monitoring systems plant, analyse water quality monitoring systems plant faults, monitor and inspect water quality monitoring systems plant and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS326 Operate and monitor oil systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, monitor and inspect oil systems.

Power generation facilities rely on oil systems to run power generation applications. Maintaining clean oil systems is essential to equipment and plant reliability.

Competency in this unit requires the ability to plan work, operate oil systems plant, test oil systems plant, analyse oil systems plant faults, monitor and inspect oil systems plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues related to operating and monitoring oil system plant are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements are identified, in accordance with workplace procedures from appropriate personnel and documentation
	1.3 Documentation to determine oil system plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection, preoperational checks and field preparations for oil system service are carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Oil system plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of oil system plant is determined, in accordance with workplace procedures and site requirements
2 Operate oil system plant	**2.1** Oil system plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Oil system plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective actions are taken, to rectify oil system plant abnormalities, in accordance with workplace procedures, industry standards and site requirements
	2.4 Oil system plant is removed from service, in accordance with workplace procedures and site requirements

© Commonwealth of Australia, 2025 Powering Skills Organisation

3	**Test oil system plant operation**	**3.1** Operational tests are performed, in accordance with workplace procedures
		3.2 Oil systems plant is observed for correct operational response, in accordance with workplace procedures
		3.3 Corrective action is taken when response does not meet with documentation, oil system plant integrity or personnel safety requirements
		3.4 Oil system plant is returned to required operational status upon completion of testing, in accordance with workplace procedures
4	**Analyse oil system plant faults**	**4.1** Causes of abnormal oil system plant operating conditions are identified, in accordance with workplace procedures, and by analysing technical and operational information
		4.2 Corrective action is taken, in accordance with workplace procedures
		4.3 Oil system plant integrity and personnel safety is maintained, in accordance with workplace procedures, and by consultation with appropriate personnel and technical and operational documentation
5	**Monitor and inspect oil system plant**	**5.1** Oil system plant to be monitored and/or inspected is physically identified, in accordance with workplace procedures
		5.2 Oil system plant is monitored and/or inspected, in accordance with workplace procedures, to detect deviations from normal operating conditions
		5.3 Corrective action is taken, in accordance with workplace procedures
		5.4 Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
6	**Complete documentation**	**6.1** Oil system plant problems, movements, abnormalities and status are reported, in accordance with workplace procedures
		6.2 Documentation is updated, in accordance with workplace procedures

Assessment Requirements for UEPOPS326 Operate and monitor oil systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing oil system plant faults data analysis techniques and tools
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with personnel
- completing documentation
- identifying oil system plant status
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring and inspecting oil system plant operation
- operating oil system plant
- organising resources
- preparing and planning work
- recognising and responding to abnormal oil system plant operating conditions
- testing oil system plant operationally diagnostic and testing techniques
- utilising permit to work system
- working with oil system plant and/or equipment

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- oil system plant and equipment, its location and operating parameters including supervisory,

© Commonwealth of Australia, 2025 Powering Skills Organisation

alarm, protection and control equipment
- oil system plant status
- permit to work system
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

UEPOPS327 Monitor and maintain civil assets

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to monitor and conduct maintenance to ensure the integrity of power generation civil assets.

Civil asset maintenance strategies are used to preserve and extend the service life of infrastructure. Civil assets may include infrastructure such as water treatment facilities, sewer pipelines, roads, utility grids, bridges, tunnels and railways.

Competency in this unit requires the ability to plan work, monitor civil assets, maintain civil assets and the completion of all work. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

Assessment Requirements for UEPOPS327 Monitor and maintain civil assets

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with personnel
- completing work
- identifying and selecting equipment and materials for civil asset maintenance work
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers specifications and manuals
- maintaining civil assets
- monitoring civil assets
- planning work
- storing and maintaining tools and equipment
- using monitoring and maintenance procedures

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- layout of worksite and civil assets
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- monitoring and maintenance techniques
- principles of hydroelectric generation
- typical arrangements of hydroelectric generation plant

UEPOPS328 Undertake dam safety surveillance

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct ongoing surveillance of water storage facilities to ensure structural integrity and water quality is maintained.

Hydropower relies on water stored in dams to create electricity therefore, the structural integrity of dams is essential to the smooth operation of hydro power generation systems and plant.

Competency in this unit requires the ability to plan and prepare for work, undertake dam safety surveillance, sample and record water quality and complete work. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

UEPOPS329 Operate and monitor auxiliary steam systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor auxiliary steam systems in a power generation facility.

The function of an auxiliary steam system is to deliver ancillary steam, as required, to ensure the smooth operation of plant and equipment. Auxiliaries serve to keep steam water cycles safely circulating, and to return it to its thermodynamic starting point.

Competency in this unit requires the ability to plan work, operate auxiliary steam system plant, test auxiliary steam system plant, analyse auxiliary steam system plant faults, monitor and inspect auxiliary steam system plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for auxiliary steam system plant operation	**1.1** Safety issues related to operating and monitoring auxiliary steam system plant are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements including permits to work are identified, in accordance with workplace procedures, and from relevant personnel and documentation
	1.3 Documentation to determine auxiliary steam system plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection, preoperational checks and field preparation for auxiliary steam system plant service are carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Auxiliary steam system plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of auxiliary steam system plant is determined, in accordance with workplace procedures and site requirements
2 Operate auxiliary steam system plant	**2.1** Auxiliary steam system plant is operated, in accordance with workplace procedures and manufacturers' operating recommendations
	2.2 Auxiliary steam system plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective actions are taken to rectify auxiliary steam system plant abnormalities, in accordance with workplace procedures, industry standards and site requirements
3 Test auxiliary steam system plant operation	**3.1** Operational tests are performed, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	3.2	Auxiliary steam system plant is observed for correct operational response, in accordance with workplace procedures
	3.3	Corrective action is taken when response does not meet with documentation, auxiliary steam system plant integrity or personnel safety requirements
	3.4	Auxiliary steam system plant is returned to required operational status upon completion of testing, in accordance with workplace procedures
4 Analyse auxiliary steam system plant faults	**4.1**	Causes of abnormal auxiliary steam system plant operating conditions are identified, in accordance with workplace procedures, and by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Auxiliary steam system plant integrity and personnel safety is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect auxiliary steam system plant	**5.1**	Auxiliary steam system plant to be monitored and inspected is physically identified, in accordance with workplace procedures
	5.2	Auxiliary steam system plant is monitored and inspected, in accordance with workplace procedures, to detect deviations from normal operating conditions of the plant
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified, in accordance with workplace procedures, when defects are detected
6 Complete documentation	**6.1**	Auxiliary steam system plant problems, movements, and status are reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

Assessment Requirements for UEPOPS329 Operate and monitor auxiliary steam systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing auxiliary steam system plant faults using data analysis techniques and tools
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with personnel
- completing documentation
- coordinating the operation of auxiliary steam system equipment
- identifying auxiliary steam system plant status
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring and inspecting auxiliary steam system plant operation
- operating auxiliary steam system plant
- organising resources
- performing isolations
- preparing and planning work
- recognising and responding to abnormal auxiliary steam system plant operating conditions
- testing auxiliary steam system plant operationally using diagnostic and testing techniques
- using permit to work system
- working with auxiliary steam system plant and/or equipment

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

© Commonwealth of Australia, 2025 Powering Skills Organisation

- auxiliary steam system plant and equipment, its location and operating parameters
- auxiliary steam system plant status
- characteristic auxiliary steam plant faults and corrective actions
- isolations
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- typical arrangements of power production plant
- workplace documentation
- workplace policies and procedures
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

UEPOPS330 Operate and monitor heat exchangers and cooling systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate and monitor heat exchangers and cooling systems within power generation facilities.

A heat exchanger is used in power generation facilities to maintain efficiency in the steam and water cycle. The cooling system is used to reduce the heat from power generation plant and/or equipment.

Competency in this unit requires the ability to plan work, operate heat exchangers and cooling system plant, test heat exchangers and cooling system plant, analyse heat exchangers and cooling system plant faults, monitor and inspect heat exchangers and cooling system plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power plant as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Assessment Requirements for UEPOPS330 Operate and monitor heat exchangers and cooling systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing heat exchangers and cooling system plant faults using data analysis techniques and tools
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe work practices
- communicate with personnel
- completing documentation
- identifying heat exchangers and cooling system plant status
- implementing legislation, industry standards, codes of practice and regulations
- monitoring and inspecting heat exchangers and cooling system plant
- operating heat exchangers and cooling system plant
- organising resources
- preparing and planning work
- recognising and responding to abnormal heat exchangers and cooling system plant operating conditions
- testing heat exchangers and cooling system plant operationally using diagnostic and testing techniques
- utilising the permit to work system
- working with heat exchangers and cooling system plant and/or equipment for operation

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- heat exchangers and cooling system plant and equipment, its location and operating

© Commonwealth of Australia, 2025 Powering Skills Organisation

parameters
- heat exchangers and cooling system plant status
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe work practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS331 Operate and monitor water systems (condensate and feedwater)

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor water systems (condensate and feedwater).

Water systems are used to supply high quality water to the generator and to heat water. Between the condenser and feedwater pump, the water is called condensate and between the feedwater pump and the generator the water is called feedwater.

Competency in this unit requires the ability to plan work, operate water system (condensate and feedwater) plant, test water system plant, analyse water system plant faults, monitor and inspect water system plant and the completion of all documentation. Individuals will, in general, work as an operator in a power generation plant.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for water systems plant operation	**1.1** Safety issues related to operating and monitoring water system plant are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements including permit to work are identified, in accordance with workplace procedures, from relevant personnel and documentation
	1.3 Documentation to determine water system plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection, preoperational checks and field preparation for water system plant service are carried out, in accordance with workplace procedures and manufacturers' recommendations
	1.5 Water system plant operational prerequisites are established, in accordance with workplace procedures and manufacturers' recommendations
	1.6 Sequence for recommissioning of water system plant is determined, in accordance with workplace procedures and site requirements
2 Operate water system plant	**2.1** Water system plant is operated, in accordance with workplace procedures and manufacturers' operating recommendation
	2.2 Water system plant is monitored and observed, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.3 Corrective actions are taken to rectify water system abnormalities, in accordance with workplace procedures, industry standards and site requirements
3 Test water system plant operation	**3.1** Operational tests are performed, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	3.2	Water system plant is observed for correct operational response, in accordance with workplace procedures
	3.3	Corrective action is taken when response does not meet with documentation, water system plant integrity or personnel safety requirements
	3.4	Water system plant is returned to required operational status upon completion of testing, in accordance with workplace procedures
4 Analyse water system plant faults	**4.1**	Causes of abnormal water system plant operating conditions are identified, in accordance with workplace procedures, and by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Water system plant integrity and personnel safety is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect water system plant	**5.1**	Water system plant to be monitored and inspected is physically identified, in accordance with workplace procedures
	5.2	Water system plant is monitored and inspected, in accordance with workplace procedures, for normal operation or to detect deviations
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
6 Complete documentation	**6.1**	Water system plant problems, movements and status are reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

UEPOPS332 Operate and monitor condenser and auxiliary cooling systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor condenser and auxiliary cooling systems.

Auxiliary cooling systems deliver cool water or air, as required, to reduce the heat from plant and equipment in power generation facilities. The condenser is used to change gas to liquid by cooling it.

Competency in this unit requires the ability to plan work, operate condenser cooling system plant, test condenser cooling system plant, analyse condenser cooling system plant faults, monitor and inspect condenser cooling system plant and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPOPS333 Operate and monitor HRSG hot gas control system

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor Heat Recovery Steam Generator (HRSG) hot gas control systems.

HRSGs are used to recover heat from a hot gas streams which is then supplied to a steam turbine to generate additional electric power. The hot gas control system is used operate the internal gas return and/or bypass system in the HRSG.

Competency in this unit requires the ability to plan work, operate heat recovery steam generator plant, test heat recovery steam generator plant, analyse heat recovery steam generator plant faults, monitor and inspect heat recovery steam generator plant and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

UEPOPS335 Operate a hydro generator synchronous condenser pump unit

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to start up, maintain a steady state of running and then shutdown a hydro unit operating either as a generator, synchronous condenser or pump.

Using synchronous condenser operations in hydro generation facilities can improve the quality of electric power being supplied, and it assists in stabilising the network during faults.

Competency in this unit requires the ability to plan and prepare work and to operate, test, analyse and report on hydro generator synchronous condenser plant. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Assessment Requirements for UEPOPS335 Operate a hydro generator synchronous condenser pump unit

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) including:
  - risk control measures
  - emergency procedures
  - safe working practices
- communicating with personnel
- identifying and responding to abnormal plant operating conditions
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring and inspecting hydro generator synchronous condenser pump unit plant operations
- operating hydro generator synchronous condenser pump unit plant completing workplace documentation
- organising resources
- planning hydro generator synchronous condenser pump unit plant work
- recognising hydro turbine generator/pump unit plant status
- reporting on hydro generator pump unit plant status
- testing hydro turbine generator synchronous condenser pump unit plant operationally using diagnostic and data analysis techniques
- utilising measuring and testing instruments to identify faults and abnormalities

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- hydro turbine generator synchronous condenser pump unit plant and equipment, its location and operating parameters
- hydro turbine generator synchronous condenser pump unit plant operation

© Commonwealth of Australia, 2025 Powering Skills Organisation

- manufacturers' specifications and manuals
- typical arrangements of power production plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS336 Manage, operate and monitor a gas turbine unit

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the management of an in-service gas turbine unit.

A gas turbine is an internal combustion engine that converts natural gas or other liquid fuels to mechanical energy.

Competency in this unit requires the ability to plan work, operate gas turbine plant, test gas turbine plant, analyse gas turbine plant faults, monitor gas turbine plant and complete all documentation. Individuals will, in general, work as a frontline manager or supervisor, in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues related to managing, operating and monitoring gas turbine plant are identified in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 Work requirements are identified, in accordance with workplace procedures, from appropriate personnel and documentation
	1.3 Preoperational checks are carried out on gas turbine plant, in accordance with workplace procedures, manufacturer s' recommendations and site requirements
2 Operate gas turbine plant	**2.1** Output is adjusted to achieve required gas turbine operating conditions and demand, in accordance with workplace procedures
	2.2 Gas turbine plant is operated within limits of its' design, in accordance with workplace procedures
	2.3 Gas turbine plant is monitored and observed, in accordance with workplace procedures, to detect deviations from operating conditions
	2.4 Corrective actions are taken to rectify gas turbine plant abnormalities, in accordance with workplace procedures and manufacturers' recommendations
3 Test gas turbine plant operation	**3.1** Operational tests are performed, in accordance with workplace procedures
	3.2 Gas turbine plant is observed for correct operational response, in accordance with workplace procedures
	3.3 Corrective action is taken when response does not meet with documentation, gas turbine plant integrity or personnel safety requirements
	3.4 Gas turbine plant is returned to required operational status upon completion of testing, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

4 Analyse gas turbine plant faults	**4.1**	Causes of abnormal gas turbine plant operating conditions are identified, in accordance with workplace procedures, and by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Gas turbine plant integrity and personnel safety is maintained, in accordance with workplace procedures, and in consultation with appropriate personnel and technical and operational documentation
	4.4	Appropriate personnel are notified, in accordance with workplace procedures, when defects are detected
5 Monitor gas turbine plant	**5.1**	Gas turbine plant to be monitored is identified, in accordance with workplace procedures
	5.2	Gas turbine plant is monitored, in accordance with workplace procedures, for normal operation or to detect deviations
	5.3	Appropriate personnel are notified, in accordance with workplace procedures, when defects are detected
6 Complete documentation	**6.1**	Gas turbine plant problems, movements, and status is reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

Assessment Requirements for UEPOPS336 Manage, operate and monitor a gas turbine unit

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing gas turbine plant faults using data analysis techniques and tools
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with personnel
- completing documentation
- identifying gas turbine plant status
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring gas turbine plant operations
- organising resources
- planning work
- preparing and operating gas turbine plant and/or equipment
- recognising and responding to abnormal gas turbine plant operating conditions
- testing gas turbine plant operationally using diagnostic and test techniques
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- gas turbine plant and equipment, its location and operating parameters gas turbine plant generator types and characteristics including:
  - system components and their interaction

© Commonwealth of Australia, 2025 Powering Skills Organisation

  - gas turbine operational processes
  - gas turbine plant status
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- permit to work system
- typical arrangements of power production
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

UEPOPS337 Maintain quality systems within the team

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to oversee compliance of the maintenance quality system, using performance indicators, within a team environment.

Quality control is a process through which an organisation seeks to ensure that significant variations in quality are kept to a minimum. Quality control in power generation facilities will focus on a set of procedures intended to ensure that personnel, plant and equipment operate efficiently.

Competency in this unit requires the ability to formulate team aspects of the quality system and facilitate team quality systems. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Formulate team aspects of the quality system	**1.1** Quality assurance requirements for team are identified or modified from an analysis of workplace needs, in accordance with workplace procedures
	1.2 Team performance indicators, are referred to appropriate personnel for approval in accordance with workplace procedures
	1.3 Quality system documentation is obtained, and modified, in accordance with workplace procedures and quality assurance standards
2 Facilitate team quality systems	**2.1** Team discussion on quality system is undertaken, in accordance with workplace procedures
	2.2 Quality system is monitored, in accordance with workplace procedures and quality assurance standards
	2.3 Failure to satisfy Key Performance Indicators (KPIs) is recorded and investigated, in accordance with workplace procedures and quality assurance standards
	2.4 Quality system is reviewed with the team to ensure currency and relevance, in accordance with workplace procedures and quality assurance standards
	2.5 Quality system records for the team are maintained, in accordance with workplace procedures and quality assurance standards

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

UEPOPS338 Facilitate workplace communication

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to facilitate workplace communication.

Workplace communication is the process of exchanging information, both verbal and non-verbal, within a team or unit.

Competency in this unit requires the ability to plan and prepare for communication, facilitate team communications and determine team views. Individuals will, in general, work as a coordinator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPOPS339 Operate and monitor a boiler unit

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate and monitor an in-service boiler unit capable of supplying steam.

Boilers are used to create steam by applying heat to water, the steam expands and turns the turbines and these in turn drive the generators in power generation facilities.

Competency in this unit requires the ability to plan work, operate boiler unit plant, test boiler unit plant, analyse boiler unit plant faults, monitor and inspect boiler unit and complete all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. UEPOPS340 Operate and monitor a steam turbine

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate and monitor an in-service steam turbine.

A steam turbine extracts thermal energy from pressurised steam and is particularly suited to driving an electrical generator as the high pressure steam is used to turn electricity generators at elevated speed.

Competency in this unit requires the ability to plan work, operate steam turbine plant, test steam turbine plant, analyse steam turbine plant faults, monitor and inspect steam turbine and the completion of all documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS342 Analyse single protection device operation

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to analyse the operation of single protection devices.

Protection devices aim to keep power generation systems stable by isolating the components that are faulty, whilst leaving as much of the network as possible still in operation. Single operation protection devices are designed for specific types of apparatus used in power generation facilities.

Competency in this unit requires the ability to respond to single protection device operation, interpret and determine cause of single protection device operation, restore single protection device operation and complete documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator. Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Respond to protection operation	**1.1** Electrical and mechanical single protection device operations are confirmed, in accordance with workplace procedures
	1.2 Apparatus affected by single protection device operations are identified, in accordance with workplace procedures
	1.3 Single protection device targets, flags and alarms are identified, and recorded, in accordance with workplace procedures
	1.4 Relevant stakeholders are advised, in accordance with workplace procedures
2 Interpret and determine cause of protection operation	**2.1** Communication with external stakeholders, and internal personnel, is undertaken and is recorded, in accordance with workplace procedures
	2.2 Information on single protection device operations is collated and assessed, in accordance with workplace procedures
	2.3 Sequence of events prior to, and following, single protection device operation is identified and analysed, in accordance with workplace procedures
	2.4 Single protection device operations are analysed and evaluated, in accordance with workplace procedures
	2.5 Single protection device operation findings are analysed, in conjunction with recorded data, to determine most probable cause of fault, in accordance with workplace procedures
3 Restore protection	**3.1** Relevant stakeholders are informed of single protection device operation findings and plan of action, in accordance with workplace procedures
	3.2 Single protection device indicators are reset, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	3.3	Corrective action is taken, in accordance with fault type and workplace procedures
4 Complete documentation	**4.1**	All single protection device operations events are analysed and reported to approved personnel, in accordance with workplace procedures
	4.2	Records are updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS342B Interpret and analyse single operation protection devices.

Assessment Requirements for UEPOPS342 Analyse single protection device operation

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with stakeholders
- communicating with stakeholders
- completing documentation
- implementing legislation, industry standards, codes of practice and regulations
- interpreting and analysing cause of electrical and mechanical single protection devices operation
- interpreting and determining cause of single protection device operations
- responding to electrical and mechanical single protection device operations
- responding to single protection device operations
- restoring electrical and mechanical single protection device status
- restoring single protection devices
- using manufacturers' specifications and manuals

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- alarms and flags raised by single protection devices
- causes of single protection devices operation
- fault finding methods and tools
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals

© Commonwealth of Australia, 2025 Powering Skills Organisation

- resetting or restoring electrical and mechanical protection
- single protection devices
- single protection systems and schemes including electrical and mechanical protection
- stakeholder communication
- types of electrical and mechanical faults
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS343 Operate hydroelectric generating plant and auxiliary equipment

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate a hydroelectric power generating facility. It includes the operational and maintenance activities associated with hydroelectric operating plant and auxiliary equipment.

Auxiliary plant systems and related controls are used to support the operation of hydro generating facilities. Auxiliary plant systems typically include ancillary equipment such as pumps, valves, seals and screens, motors, waterwheels and generators.

Competency in this unit requires the ability to plan and prepare work, operate, test, analyse and report on hydroelectric generating plant and auxiliary equipment. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Work, Health and Safety(WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are applied and monitored
	1.2 Work, hydroelectric generating plant and type of start requirements are identified from appropriate personnel and documentation, in accordance with workplace procedures
	1.3 Turbine running-up and loading schedules are ascertained from relevant documentation, in accordance with workplace procedures and site requirements
	1.4 Hydroelectric generating plant and auxiliary equipment inspections, preoperational tests and field preparation for service are carried out, in accordance with manufacturers' recommendations and workplace procedures
	1.5 Hydroelectric generating plant and auxiliary equipment operational prerequisites are established, in accordance with manufacturers' recommendations and workplace procedures
	1.6 Sequence for recommissioning hydroelectric generating plant and auxiliary equipment is determined, in accordance with workplace procedures and site requirements
	1.7 Work is sequenced and prioritised, in accordance with workplace procedures and site requirements
2 Operate and monitor hydroelectric generating plant	**2.1** Hydroelectric generating plant is operated, in accordance with workplace procedures and manufacturers' recommendations
	2.2 Key indicator limits are maintained, in accordance with manufacturers' specifications and workplace procedures and site requirements

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.3	Auxiliary equipment is operated, in accordance with workplace procedures and manufacturers' recommendations
	2.4	Hydroelectric generating plant and auxiliary equipment is monitored, in accordance with workplace procedures, to detect deviations from normal operating conditions
	2.5	Hydroelectric generating plant and auxiliary equipment is operated, in accordance with workplace procedures and legislative requirements to gain maximum efficiency of energy conversion and to meet active and reactive despatch power outputs
	2.6	Corrective actions are taken to rectify any abnormalities, in accordance with manufacturers' recommendations and workplace procedures
3 Test hydroelectric generating plant and auxiliary equipment	**3.1**	Tests on hydroelectric generating plant and equipment are performed, in accordance with workplace procedures
	3.2	Hydroelectric generating plant and equipment is observed for correct operational response, in accordance with workplace procedures
	3.3	Hydroelectric generating plant and equipment is returned to required operational status on completion of testing, in accordance with workplace procedures
4 Analyse hydroelectric generating plant and auxiliary equipment faults	**4.1**	Causes of abnormal operating conditions are identified by analysing technical and operational information, in accordance with workplace procedures
	4.2	Hydroelectric generating plant integrity and personnel safety is maintained, in accordance workplace procedures and through consultation with appropriate personnel, technical and operational documentation
	4.3	Appropriate personnel are notified, in accordance with workplace procedures, when defects are detected
5 Complete documentation	**5.1**	Equipment problems, movements and status are reported, in accordance with workplace procedures
	5.2	Documentation is updated, in accordance with workplace procedures

UEPOPS344 Conduct water conveyance and control

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required for the operation of storage, conveyance and control systems of hydro generation water supplies.

Water storage, conveyance and control systems can include dams, canals, pipelines, tunnels and related hydraulic components and structures.

Competency in this unit requires the ability to plan work, supply water for power generation, implement flood control procedures and complete all documentation. Individuals will, in general, work as an operator in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

UEPOPS345 Implement dam safety surveillance procedures

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required for the scheduling, implementation and reporting of dam safety surveillance.

Surveillance of dams is undertaken to ensure they are operating safely. Reports on dam safety are also required to meet the power generation facility's legislative requirements.

Competency in this unit requires the ability to plan work, implement dam safety surveillance and complete safety surveillance reports. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

UEPOPS346 Conduct non-routine operational testing

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct testing of power generation plant and associated equipment which may be of a non-routine nature.

An operational check is the verification that a group of components are safely working together. Operational checks consist of running in-service electrical plant to ensure that all the systems function together.

Competency in this unit requires the ability to plan for plant in-service checks, carry out in-service electrical checks, carry out corrective actions and complete work. Individuals will, in general, work as an operator in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS347 Operate and monitor supervisory, control and data acquisition systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake monitoring and operation of screen based Supervisory, Control and Data Acquisition (SCADA) systems.

SCADA is a control system that uses computers, networked data communications and graphic interfaces. It may also use other peripheral devices to interface with process plant and/or machinery in power generation facilities.

Competency in this unit requires the ability to operate SCADA, monitor and interpret information and enhance screen display. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Operate SCADA screen displays	**1.1** Safety issues related to operating and monitoring a Supervisory Control and Data Acquisition (SCADA) system are identified, in accordance with workplace procedures and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and legislative requirements
	1.2 SCADA system requirements are identified, in accordance with workplace procedures, from appropriate personnel and documentation
	1.3 Screen displays and applications are identified and retrieved, in accordance with workplace procedures and SCADA system requirements
	1.4 Functions available from the screen based equipment are identified and selected, in accordance with workplace procedures and SCADA system requirements
	1.5 Functions available from screen based equipment are utilised, in accordance with workplace procedures and SCADA system requirements
2 Monitor and interpret SCADA information	**2.1** Screen displays are monitored, in accordance with workplace procedures and SCADA system requirements
	2.2 Abnormal values or faults are identified by analysis of information obtained from screen displays, in accordance with workplace procedures and SCADA system requirements
	2.3 Corrective action is taken, in accordance with workplace procedures and SCADA system requirements
	2.4 Alarms are acknowledged, prioritised and responded to in accordance with workplace procedures and SCADA system requirements
3 Enhance SCADA screen display	**3.1** Requirements for the development of new screen displays are identified and confirmed, in accordance with workplace procedures and SCADA system requirements

© Commonwealth of Australia, 2025 Powering Skills Organisation

3.2	New screen displays are researched, assessed and confirmed with appropriate personnel, in accordance with workplace procedures and SCADA system requirements

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS347B Operate and monitor supervisory, control and data acquisition systems.

Assessment Requirements for UEPOPS347 Operate and monitor supervisory, control and data acquisition systems

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying legislation, industry standards, codes of practice and regulations
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe work practices
- communicating with personnel
- enhancing screen display
- managing screen based equipment including the full range of applications
- monitoring and interpreting information from Supervisory Control and Data Acquisition (SCADA)
- operating screen displays
- responding and prioritising response to alarms
- using manufacturers' specifications and manuals

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- alarm systems
- Distributed Control System (DCS)
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- remote telemetry and data acquisition
- Supervisory Control and Data Acquisition (SCADA) system
- Windows operating system
- WHS/OHS legislated requirements including:

© Commonwealth of Australia, 2025 Powering Skills Organisation

  - emergency procedures
  - risk control measures
  - safe work practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS349 Operate local H.V. switchgear

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the local operation of High Voltage (H.V.) switchgear devices.

A switchgear is a combination of electrical disconnect switches, fuses or circuit breakers used to control, protect and isolate electrical equipment.

Competency in this unit requires the ability to plan and prepare work, conducting H.V. switchgear operations, validating H.V. switchgear integrity and completing documentation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare to operate High Voltage (H.V.) switchgear	**1.1** Work requirements are identified and confirmed with appropriate personnel, in accordance with workplace procedures
	1.2 Safety precautions when operating High Voltage (H.V.) switchgears are identified, in accordance with Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, industry standards and workplace procedures
	1.3 Identify H.V. switch gear type and determine correct operation, in accordance with workplace procedures
	1.4 Examine and assess H.V. switchgear conditions for safe operation, in accordance with workplace procedures
	1.5 Suppress H.V. switchgear related protection, where necessary, in accordance with workplace procedures
	1.6 Personnel participating in work are briefed and roles and responsibilities are confirmed, in accordance with workplace procedures
2 Conduct H.V. switch gear operations	**2.1** Mechanical operation and limitations of equipment is identified, in accordance with workplace procedures
	2.2 Implications of proposed work actions are identified, in accordance with workplace procedures
	2.3 H.V. switchgear is operated and its' status is confirmed, in accordance with workplace procedures
	2.4 H.V. switchgear racking, testing, isolation, circuit earthing and reinstatement processes are carried out, in accordance with manufacturers' instructions and workplace procedures
	2.5 Test equipment integrity is confirmed, and H.V. switchgear is de-energised, in accordance with workplace procedures
3 Validate H.V. switchgear	**3.1** H.V. switchgear is inspected for safe operation, in

© Commonwealth of Australia, 2025 Powering Skills Organisation

integrity		accordance with workplace procedures
	3.2	H.V. switchgear environment is inspected, in accordance with workplace procedures, to ensure it meets all statutory and industry requirements
4 Complete documentation	**4.1**	H.V switchgear status is reported, in accordance with workplace procedures
	4.2	Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Assessment Requirements for UEPOPS349 Operate local H.V. switchgear

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations including:
  - emergency procedures
  - hazard identification
  - Personal Protective Equipment (PPE)
  - risk control measures
  - safe working practices
- communicating with personnel
- completing documentation
- de-energising H.V. switchgear
- identifying H.V. switchgear plant status
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications, diagrams and manuals
- isolating and earthing H.V. switchgear and equipment
- locating H.V. switchgear and equipment
- operating H.V. switchgear within design parameters
- organising resources and equipment
- planning H.V. switchgear work
- recognising abnormal H.V. switch gear operations
- reporting on H.V. switchgear status
- using High Voltage (H.V.) electrical operational procedures and practices
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes

UEPOPS351 Operate H.V. condition changing apparatus

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the operation of all High Voltage (H.V.) condition changing apparatus.

H.V. condition changing apparatus can include on and off load transformer tap changers, capacitor banks, rotary converters, voltage regulators, reactors, current limiters, rectifiers and transformers. H.V. changing apparatus works within system parameters such as voltage, current, frequency, volt ampere reactive load and equipment capability.

Competency in this unit requires the ability to plan and prepare work, operate H.V. condition change apparatus and report on H.V. condition during operation. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare to operate H.V. condition changing apparatus	**1.1** Safety requirements for operating High Voltage (H.V.) condition changing apparatus are adhered to, in accordance with Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, manufacturers' specifications and workplace procedures
	1.2 Location of H.V. condition changing apparatus is determined from plans, drawings, system diagrams and maps, in accordance with workplace procedures
	1.3 H.V. condition changing apparatus to be operated, is identified and confirmed, with relevant personnel, in accordance with workplace procedures
	1.4 Condition and status of H.V. condition changing apparatus is determined visually, in accordance with workplace procedures
	1.5 H.V. condition changing apparatus is prepared for operation, in accordance with workplace procedures
2 Conduct H.V. condition changing apparatus operation	**2.1** Relevant personnel are advised of progress during H.V. condition changing apparatus operation, in accordance with workplace procedures
	2.2 Conditions are evaluated prior to H.V. changing apparatus operation, in accordance with workplace procedures
	2.3 H.V. condition changing apparatus is operated in accordance with workplace procedures and manufacturers' recommendations
	2.4 H.V. condition changing apparatus is controlled and adjusted to achieve desired outcomes, in accordance with workplace procedures
	2.5 H.V. condition changing apparatus is examined, in accordance with workplace procedures, to ensure it has functioned correctly

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.6	Conditions are re-evaluated to confirm correct H.V. condition changing apparatus outcome, in accordance with workplace procedures
	2.7	H.V. condition changing apparatus is secured, in accordance with workplace procedures
	2.8	Status of H.V. condition changing apparatus is confirmed, in accordance with workplace procedures
3 Complete documentation	**3.1**	Equipment problems, movements, and status are reported, in accordance with workplace procedures
	3.2	Documentation is updated, in accordance with workplace procedures

UEPOPS352 Conduct operational checks on in-service mechanical plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to conduct operational checks on in-service mechanical plant. Mechanical plant refers to the infrastructure used in the operation and maintenance of power generating facilities.

An operational check is the verification that a group of components are working together. An operational check consists of running in-service mechanical plant to ensure that all the systems function together safely.

Competency in this unit requires the ability to plan for plant in-service checks, carry out in-service mechanical checks and complete work. Individuals will, in general, work as an operator in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan for mechanical plant in-service checks	**1.1** Safety issues and Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations and industry standards are identified, in accordance with workplace procedures
	1.2 Work, in-service mechanical plant and resource requirements are identified from work orders and documentation, in accordance with workplace procedures
	1.3 In-service mechanical plant status and work requirements are confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.4 Equipment is checked for correct calibration and operation and materials or components are obtained and inspected, in accordance with workplace procedures
	1.5 Potential hazards are identified and risk control measures are selected, in accordance with workplace procedures
	1.6 Pre-access checks on in-service mechanical plant are carried out, in accordance with workplace procedures and site requirements
2 Carry out in-service mechanical plant check	**2.1** In-service mechanical plant is operated, in accordance with workplace procedures and manufacturers' recommendations
	2.2 In-service mechanical plant checks are monitored and observed, in accordance with workplace procedures, to detect deviations from normal operation
	2.3 Corrective actions are taken to rectify in-service mechanical plant abnormalities, in accordance with manufacturers' recommendations and workplace procedures
	2.4 In-service mechanical plant checks are performed, in accordance with workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

	2.5	In-service mechanical plant integrity and personnel safety are maintained, in accordance with workplace procedures, and in consultation with personnel and technical and operational documentation
3 Complete work	**3.1**	In-service mechanical plant checks are completed and control measures are returned to required operational status, where appropriate, in accordance with workplace procedures
	3.2	Appropriate personnel are notified of completion of work, in accordance with workplace procedures
	3.3	In-service mechanical plant problems or abnormalities are reported, in accordance with workplace procedures
	3.4	In-service mechanical plant results are interpreted and documented, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS352B Conduct operational checks on in-service mechanical plant.

Assessment Requirements for UEPOPS352 Conduct operational checks on in-service mechanical plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- assessing operation of power generating plant
- carrying out in-service mechanical plant check
- communicating with personnel
- completing work
- finding faults including leaks and corrosion
- implementing legislation, industry standards, codes of practice and regulations
- inspecting of in-service mechanical plant equipment associated with electricity generating plant
- planning for in-service mechanical plant in-service check
- undertaking minor performance checking and testing
- utilising manufactures' specifications and manuals
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- assessment of operation of electrical plant
- inspection of electrical plant equipment
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- minor performance checking and testing including fault finding, leaks and corrosion

© Commonwealth of Australia, 2025 Powering Skills Organisation

- permit to work system
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

UEPOPS354 Operate and monitor dual fuel firing plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to operate, inspect and monitor dual fuel firing plant in which each fuel source provides a 100% maximum continuous rating.

Dual fuel firing plant must provide the means for maintaining a100% maximum continuous rating by using alternative sources of fuel.

Competency in this unit requires the ability to plan work, operate, test, analyse and report on duel fuel firing plant operations. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare work	**1.1** Safety issues are identified, in accordance with Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards and workplace procedures
	1.2 Work requirements are identified from appropriate personnel and documentation, in accordance with workplace procedures
	1.3 Documentation to determine dual fuel firing plant status is assessed and evaluated, in accordance with workplace procedures
	1.4 Inspection, pre-operational tests and field preparations for dual fuel firing service are carried out, in accordance with manufacturers' recommendations and workplace procedures
	1.5 Dual fuel firing plant operational prerequisites are established, in accordance with manufacturers' recommendations and workplace procedures
	1.6 Sequence for recommissioning of dual fuel firing plant is determined, in accordance with workplace procedures and site requirements
2 Conduct operation of duel fuel firing plant	**2.1** Dual fuel firing plant is operated, in accordance with workplace procedures and manufacturers' recommendations
	2.2 Changeover from one fuel source to the other is conducted with minimal effect on load and steam conditions, in accordance with manufacturers' recommendations and workplace procedures
	2.3 Duel fuel firing plant is monitored to detect deviations from normal operating conditions, in accordance with workplace procedures
	2.4 Corrective actions are taken to rectify duel fuel firing plant abnormalities, in accordance with manufacturers' recommendations and workplace procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

3 Test, monitor, analyse and report on duel fuel firing plant operation	**3.1**	Tests are performed on duel fuel firing plant, in accordance with workplace procedures
	3.2	Duel fuel firing plant is observed for correct operational response, in accordance with workplace procedures
	3.3	Corrective action is taken, in accordance with workplace procedures, when response is not in accordance with documentation, plant integrity or personnel safety
	3.4	Duel fuel firing plant is returned to required operational status upon completion of testing, in accordance with workplace procedures
4 Analyse duel fuel firing plant faults	**4.1**	Causes of abnormal duel fuel firing plant operating conditions are identified, in accordance with workplace procedures, by analysing technical and operational information
	4.2	Corrective action is taken, in accordance with workplace procedures
	4.3	Duel fuel firing plant integrity and personnel safety is maintained, in accordance with workplace procedures and through consultation with appropriate personnel and technical and operational documentation
5 Monitor and inspect duel fuel firing plant	**5.1**	Duel fuel firing plant to be monitored and inspected is physically identified
	5.2	Duel fuel firing plant is monitored and inspected for normal operation, in accordance with workplace procedures to detect deviations
	5.3	Corrective action is taken, in accordance with workplace procedures
	5.4	Appropriate personnel are notified when defects are detected, in accordance with workplace procedures
6 Complete documentation	**6.1**	Duel fuel firing plant problems, movements, and status are reported, in accordance with workplace procedures
	6.2	Documentation is updated, in accordance with workplace procedures

Assessment Requirements for UEPOPS354 Operate and monitor dual fuel firing plant

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- communicating with personnel
- completing documentation using recording procedures
- identifying and responding to abnormal plant operating conditions
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring and inspecting dual fuel firing plant
- operating duel fuel firing plant
- organising resources
- planning dual fuel firing plant or equipment for operation
- reporting on dual fuel firing plant status
- testing dual fuel firing plant operationally using diagnostic and data analysis techniques using testing and measurement instruments to identify faults and abnormalities
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- dual fuel firing plant and equipment, its location and operating parameters
- dual fuel firing plant status
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals

© Commonwealth of Australia, 2025 Powering Skills Organisation

- permit to work system
- test and fault finding techniques
- typical arrangements for power generation plant
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS355 Monitor the implementation of under frequency load shedding

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to implement and monitor under frequency load shedding for isolated and integrated generation network systems.

Under frequency load shedding is the deliberate shutdown of electric power in a part or parts of the power system to prevent the failure of the entire system. It is generally caused by overloading a power source or problems with a prime mover such as a turbine.

Competency in this unit requires the ability to plan work, set under frequency load shedding, respond to under frequency load shedding operation and the completion of all documentation. Individuals will, in general, work as an operator in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Competency Field

Operations

Unit Sector

Electricity generation

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan for load shedding	**1.1** Safety issues Work, Health and Safety (WHS)/Occupational Health and Safety(OHS) regulations are identified, in accordance with workplace procedures and site requirements
	1.2 Work tasks, load shedding plant and resource requirements are identified from relevant information and documentation, in accordance with workplace procedures
	1.3 Checks are carried out on under frequency load shedding plant, in accordance with workplace procedures and site requirements
2 Set under frequency load shedding	**2.1** Individual load source data is collated, assessed, evaluated and prioritised, in accordance with workplace procedures
	2.2 Data is assessed against trends, in accordance with workplace procedures, to determine suitability for load shed selection
	2.3 Load data is grouped and summed into stages of priority to match generator or unit output, in accordance with workplace procedures
	2.4 Selected load shedding is implemented, in accordance with workplace procedures
	2.5 Staged load data is monitored and recalculated to detect deviations from parameters, in accordance with workplace procedures
3 Respond to under frequency load shedding operation	**3.1** Load data is monitored and selections are adjusted, in accordance with workplace procedures, to maintain values within permissible parameters
	3.2 Stakeholders are consulted and corrective action is determined for load shedding deviations, in accordance with workplace procedures
4 Complete documentation	**4.1** Load shedding status is reported, in accordance with

© Commonwealth of Australia, 2025 Powering Skills Organisation

workplace procedures

4.2 Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS355B Monitor the implementation of under frequency load shedding.

Assessment Requirements for UEPOPS355 Monitor the implementation of under frequency load shedding

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- analysing power generation plant and system using data using data analysis techniques and tools
- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
- communicating with stakeholders
- implementing legislation, industry standards, codes of practice and regulations
- interpreting remote indications of power generation plant status
- monitoring operation of power generation plant and equipment
- planning and preparing power generation plant and/or equipment for operation
- recognising abnormal power generation plant operating conditions and determining corrective actions
- responding to under frequency load shedding operations including:
  - forecasting system load shifting
  - setting load shedding within operational parameters
- scheduling load shedding to match generator output completing documentation
  - emergency procedures
  - risk control measures
  - safe working practices
- using manufacturers' specifications and manuals
- working with permit to work system

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals

© Commonwealth of Australia, 2025 Powering Skills Organisation

- permit to work system
- power generation under frequency load shedding plant and equipment, its location and operating parameters
- typical arrangements of power production plant including power generation plant operating parameters and status
- under frequency load shedding system components and interactions including:
  - generator capacity
  - load shedding schemes
  - stakeholder communication
- WHS/OHS legislated requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS356 Apply environmental and sustainable energy procedures

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required for the implementation of environmental procedures in the workplace. It also includes identifying, assessing and controlling environmental risks and assessing the impact of work related activities.

Environmental risks can include air, soil and water pollution, wildlife and habitat loss and global warming emissions.

Competency in this unit requires the ability to plan for quality control, monitor quality control and complete all documentation. Individuals will, in general, work as an operator, in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Relate environmental procedures to specific work site	**1.1** Environmental and sustainable energy procedures are identified, in accordance with workplace procedures for implementation at work site
	1.2 Environmental and sustainable energy procedures for specific work site are reviewed with appropriate personnel
2 Implement environmental procedures	**2.1** Environmental and sustainable energy procedures are applied to specific work site, in accordance with workplace procedures
	2.2 Environmental risks and impacts are identified, in accordance with workplace procedures
	2.3 Environmental risks and impacts are assessed, in accordance with workplace procedures
	2.4 Environmental risks and impacts are controlled and monitored throughout work activities, in accordance with workplace procedures
	2.5 Environmental incidents are dealt with, in accordance with workplace procedures and emergency procedures and contingency strategies are implemented
	2.6 Environmental and sustainable energy work is conducted, in accordance with workplace procedures and the principles of sustainable energy and energy conservation
	2.7 Provision for recycling or reuse of materials is undertaken, where possible, in accordance with workplace procedures
	2.8 Environmental incidents are reported and recorded, in accordance with workplace procedures
3 Environmental procedures are reported and reviewed	**3.1** Reporting procedures for environmental and sustainable energy processes are monitored, in accordance with workplace procedures, with respect to a specific work or site

© Commonwealth of Australia, 2025 Powering Skills Organisation

3.2 Environmental risks, potential impacts and incidents are monitored and reported, in accordance with workplace procedures

3.3 Participation and contribution into reviews of environmental and sustainable energy procedures are carried out, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS356B Apply environmental and sustainable energy procedures.

UEPOPS357 Operate local L.V. switchgear

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to undertake the local operation of Low Voltage (L.V.) switchgear.

An L.V. switchgear is a combination of electrical disconnect switches, fuses or circuit breakers used to control, protect and isolate electrical equipment. Switchgears de-energise equipment to allow work to be undertaken and to clear faults downstream in electricity power systems.

Competency in this unit requires the ability to plan and prepare L.V. secondary switchgear, operating switchgear and validating, testing and reporting on L.V. switchgear integrity. Individuals will, in general, work under supervision, in a power generation facility as an operator.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Prepare to operate Low Voltage (L.V.) switchgear	**1.1** Work requirements are identified and confirmed with appropriate personnel, in accordance with workplace procedures
	1.2 Safety precautions when operating Low Voltage (L.V.) switchgears are identified, in accordance with Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, manufacturers' specifications and workplace procedures
	1.3 Location of L.V. switchgear is determined from relevant drawings, plans and maps, in accordance with workplace procedures
	1.4 Switchgear type and operating procedure is identified, in accordance with workplace procedures
	1.5 L.V. switchgear condition is assessed for safe operation, in accordance with workplace procedures
	1.6 Related L.V. switchgear protection is suppressed, if and where necessary, in accordance with workplace procedures
2 Conduct L.V. switchgear operation	**2.1** Mechanical operation and limitations of L.V switchgear are identified, in accordance with workplace procedures
	2.2 Implications of L.V. switchgear actions are identified, in accordance with workplace procedures
	2.3 L.V. switchgear is operated and required status is confirmed, in accordance with workplace procedures
	2.4 Racking, testing, isolation, circuit earthing and reinstatement processes are carried out, in accordance with Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) regulations, legislative requirements, industry standards, manufacturers' recommendations and workplace procedures
	2.5 Test equipment's integrity is confirmed, and L.V. switchgear circuit is de-energised, in accordance with

© Commonwealth of Australia, 2025 Powering Skills Organisation

		workplace procedures
3 Validate and report L.V. switchgear integrity	**3.1**	L.V. switchgear is inspected for safe operation, in accordance with workplace procedures
	3.2	L.V. switchgear environment is inspected to ensure statutory and workplace requirements are met
4 Complete documentation	**4.1**	L.V. switchgear plant problems, movements and status are reported, in accordance with workplace procedures
	4.2	Documentation is updated, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

UEPOPS358 Monitor and maintain wind farm civil assets

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to monitor and conduct preventative and remedial maintenance to ensure the integrity of civil assets associated with a wind farm.

Wind farm civil assets include infrastructure such as water treatment facilities, sewer pipelines, roads, utility grids, bridges, tunnels and railways. Civil asset maintenance in a wind power generation system involves the use of strategies to preserve and extend the service life of infrastructure.

Competency in this unit requires the ability to plan work, monitor wind farm civil assets, maintain wind farm civil assets and complete all work. Individuals will, in general, work as an operator, in a power generation facility.

Power generation plant operators are typically trained and authorised to isolate, prepare plant and issue permits to work.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Plan and prepare for work	**1.1** Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) standards, legislative requirements, industry standards, codes of practice, manufacturers' specifications, environmental obligations and workplace procedures are identified, applied and monitored
	1.2 Work requirements are identified from work orders and are confirmed with appropriate personnel or by site inspection, in accordance with workplace procedures
	1.3 Resources to satisfy work requirements are identified, obtained and inspected for compliance, in accordance with workplace procedures
	1.4 Potential hazards are identified and risk control measures are selected and implemented, in accordance with workplace procedures
	1.5 Work is sequenced and prioritised, in accordance with workplace procedures and site requirements
2 Monitor wind farm civil assets	**2.1** Inspections of wind farm civil assets are completed, in accordance with workplace procedures and site requirements
	2.2 Inspections of wind farm civil assets are reported, in accordance with workplace procedures and site requirements
	2.3 Defects in wind farm civil assets are reported, in accordance with workplace procedures and site requirements
3 Maintain wind farm civil assets	**3.1** Maintenance of wind farm civil assets is undertaken, in accordance with workplace procedures and site requirements
	3.2 Appropriate tools, equipment or plant required to maintain wind farm civil assets is utilised, in accordance with workplace procedures and manufacturers' specifications

© Commonwealth of Australia, 2025 Powering Skills Organisation

	3.3	Defects are repaired, in accordance with workplace procedures and site requirements
4 Complete work	**4.1**	Maintenance work is completed and appropriate personnel are notified, in accordance with workplace procedures
	4.2	Work area is cleared of waste, cleaned, restored and secured, in accordance with workplace procedures
	4.3	Wind farm civil asset maintenance tools and equipment are maintained and stored, in accordance with manufacturers' specifications and workplace procedures
	4.4	Work completion details are finalised, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS358A Monitor and maintain wind farm civil assets.

Assessment Requirements for UEPOPS358 Monitor and maintain wind farm civil assets

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Performance Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions on at least two separate occasions and includes:

- applying Work, Health and Safety (WHS)/Occupational Health and Safety (OHS) requirements including:
  - emergency procedures
  - risk control measures
  - safe working practices
- clearing waste from work area
- communicating with personnel
- completing work
- identifying and selecting equipment and materials
- implementing legislation, industry standards, codes of practice and regulations
- interpreting manufacturers' specifications and manuals
- monitoring and maintaining wind farm civil assets using monitoring and maintenance procedures
- planning and preparing for work
- storing and maintaining civil asset tools and equipment

Knowledge Evidence

Evidence required to demonstrate competence in this unit must be relevant to and satisfy all the requirements of the elements, performance criteria and range of conditions and includes knowledge of:

- layout of power generation wind farm facility and associated civil assets
- legislation, industry standards, codes of practice and regulations
- manufacturers' specifications and manuals
- typical arrangements of wind farm power plant including wind turbine types and characteristics
- WHS/OHS legislated requirements including:
  - emergency procedures

© Commonwealth of Australia, 2025 Powering Skills Organisation

  - risk control measures
  - safe working practices
- wind farm civil asset monitoring and maintenance techniques
- workplace documentation
- workplace policies and procedures

Assessment Conditions

As a minimum, assessors must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

As a minimum, assessment must satisfy applicable regulatory requirements, which include requirements in the Standards for Registered Training Organisations current at the time of assessment.

Assessment processes and techniques must be appropriate to the language, literacy and numeracy requirements of the work being performed and the needs of the candidate.

Assessment must occur in workplace operational situations. Where this is not appropriate, assessment must occur in simulated workplace operational situations that reflect workplace conditions.

Resources for assessment must include access to:

- a range of relevant exercises, case studies and/or other simulations
- relevant and appropriate materials, tools, equipment and personal protective equipment currently used in industry
- applicable documentation including workplace procedures, industry standards, equipment specifications, regulations, codes of practice and operation manuals.

UEPOPS359 Monitor climatic conditions for renewable energy production

Modification History

Release 1. This is the first release of this unit of competency in the UEP Generation Training Package.

Application

This unit involves the skills and knowledge required to monitor weather and climate conditions for renewable energy production. It also includes taking suitable preventative actions to ensure the safety of personnel, power generation plant and equipment in adverse weather conditions.

Renewable energy can be generated from natural resources such as sun light, wind, rain, tides and geothermal heat which are naturally replenished.

Competency in this unit requires the ability to interpret weather and climate information, carry out preventative actions, monitor weather and climate during adverse conditions, return to normal operations and complete all documentation. Individuals will, in general, work as an operator, in a power generation facility.

No licensing, legislative or certification requirements apply to this unit at the time of publication.

Note: Workplace practice

The application of the skills and knowledge described in this unit may require a licence or training permit to practice in the workplace where work is carried out on gas and electrical installations. Additional conditions may apply under state and territory legislative and regulatory licensing requirements.

Pre-requisite Unit

There are no prerequisite units.

Elements and Performance Criteria

ELEMENTS	PERFORMANCE CRITERIA
Elements describe the essential outcomes.	Performance criteria describe the performance needed to demonstrate achievement of the element.
1 Interpret weather and climate information	**1.1** Weather and climate information, including warnings, are monitored, in accordance with workplace procedures to determine likely conditions
	1.2 Potential variations in weather and climate conditions are anticipated and assessed, in accordance with workplace procedures, warnings, weather patterns and historical experience
	1.3 Possible impact of weather and climate on renewable energy plant, equipment and civil assets are identified, in accordance with workplace procedures
	1.4 Stakeholders and key personnel are informed of anticipated impact of weather and climate on renewable energy plant, equipment and civil assets, in accordance with workplace procedures
2 Carry out preventative actions	**2.1** Preventative actions are identified, in accordance with workplace procedures and manufacturers' recommendations
	2.2 Stakeholders and key personnel are consulted in the development of preventative actions, in accordance with workplace procedures
	2.3 Preventative actions are reviewed, in accordance with workplace procedures, to ensure availability of resources, safety of personnel, renewable energy plant and equipment
	2.4 Actions to minimise loss and damage of renewable energy plant, equipment and civil assets are implemented, in accordance with workplace procedures and manufacturers' recommendations
	2.5 Actions to ensure safety of personnel are implemented, in accordance with workplace procedures
3 Monitor weather and climate during adverse conditions	**3.1** Weather and climate information, including warnings, are continually monitored, in accordance with workplace procedures, to determine ongoing suitability

© Commonwealth of Australia, 2025 Powering Skills Organisation

		of preventative actions
	3.2	Preventative actions are adjusted and revised in relation to weather and climatic changes, in accordance with workplace procedures
4 Return to normal operations	**4.1**	Weather and climate information, including warnings, are monitored, in accordance with workplace procedures, to determine when normal and safe weather conditions have returned
	4.2	Renewable energy plant, equipment and civil assets are inspected for damage, in accordance with workplace procedures and manufacturers' recommendations
	4.3	Renewable energy plant, equipment and civil assets are placed back into service, in accordance with workplace procedures and manufacturers' recommendations
	4.4	Preventative actions are reviewed and recommendations are developed to improve processes, in accordance with workplace procedures
5 Complete documentation	**5.1**	Documentation is updated, in accordance with workplace procedures
	5.2	Completed documentation is forwarded to authorised personnel, in accordance with workplace procedures

Foundation Skills

Foundation skills essential to performance are explicit in the performance criteria of this unit of competency.

Range of Conditions

Range is restricted to essential operating conditions and any other variables essential to the work environment.

Non-essential conditions may be found in the Companion Volume Implementation Guide.

Unit Mapping Information

This unit replaces and is equivalent to UEPOPS359A Monitor Climatic Conditions for Renewable Energy Production.
