MEM14091A Integrate manufacturing fundamentals into an engineering task

Release 1

MEM14091A Integrate manufacturing fundamentals into an engineering task

Modification History

Release 1 (MEM05v9).

Unit Descriptor

This unit of competency covers the integration of manufacturing fundamentals to achieve an engineering or related task. It includes identifying task parameters, personal and team functions, and work health and safety (WHS) guidelines. It includes investigation of function and features of manufacturing plant, methods and processes and manufacturing fundamentals, including workshop techniques, materials, scientific and mathematical principles, and computer software.

Application of the Unit

The unit applies to engineering or related projects requiring manufacturing engineering skills and covers the identification, application and integration of manufacturing fundamentals. It is suitable for people working as manufacturing technicians and draftspersons and those pursuing manufacturing engineering or related technical qualifications and careers. If applying the unit into an enterprise or context where knowledge and skills of lean manufacturing techniques is also required, relevant competitive systems and practices units should also be selected.

Licensing/Regulatory Information

Not applicable.

Pre-Requisites

MEM23004A Apply technical mathematics

Employability Skills Information

This unit contains employability skills.

Elements and Performance Criteria Pre-Content

Elements describe the essential outcomes of a unit of competency.

Performance criteria describe the performance needed to demonstrate achievement of the element.

Elements and Performance Criteria

- | | | | |
|---|---------------------------------------|-----|---|
| 1 | Investigate scope of engineering task | 1.1 | Identify manufacturing engineering and related fundamentals to be integrated into engineering task |
| | | 1.2 | Review current functions and features of manufacturing plant, methods and processes, including production control, process maintenance options, and continuous improvement and lean manufacturing-related systems and processes |
| | | 1.3 | Identify stakeholders to be consulted |
| | | 1.4 | Confirm WHS, regulatory requirements, risk management and organisational procedures |
| | | 1.5 | Review software techniques required for task analysis and graphics |
| 2 | Integrate manufacturing fundamentals | 2.1 | Plan the task |
| | | 2.2 | Communicate, cooperate and negotiate with stakeholders, as required |
| | | 2.3 | Use systems thinking to address contingencies and constraints, problem solving and decision making, and continuous improvement to achieve integration task |
| | | 2.4 | Integrate manufacturing fundamentals to achieve task objectives |
| | | 2.5 | Seek technical and professional assistance or clarification of design information, as required |

- 3 Report results
 - 3.1 Record results of investigation, evaluation and integration
 - 3.2 Provide documentation, such as diagrams, graphics, flow charts and calculations

Required Skills and Knowledge

This section describes the skills and knowledge required for this unit.

Required skills

Required skills include:

- communicating, cooperating and negotiating with stakeholders
- identifying task parameters and manufacturing context, WHS, regulatory requirements, risk management and organisational procedures
- evaluating manufacturing principles, systems, methods and processes, and production machinery, such as:
 - lean manufacturing
 - jobbing (individual lot manufacturing)
 - transfer lines
 - cellular manufacturing
 - typical manufacturing departments, such as logistics, warehouse, production, maintenance, scheduling, sales, marketing and administration
- selecting and using software and graphics for required analysis and graphics
- planning the task
- integrating manufacturing fundamentals to achieve task objectives
- solving problems and making decisions using systems thinking and continuous improvement to address contingencies and constraints
- reporting and documenting results of investigation, evaluation and integration, diagrams and calculations
- reviewing sustainability implications, functions and features for the engineering task

Required knowledge

Required knowledge includes:

- WHS and regulatory requirements, codes of practice, and risk minimisation and registration requirements
- manufacturing methods, such as:
 - production control and flow
 - continuous improvement
 - lean techniques for quality, speed, quantity and reliability
 - manufacturing systems maintenance, such as total productive maintenance
 - jobbing, batch and mass systems
 - production lines and work cells, and batch and queue manufacturing

- functions and features of production machinery and systems related to the task
- general mechanical, electrical and mechatronic engineering fundamentals relevant to manufacturing, such as:
 - materials properties
 - mechanics
 - chemistry
 - thermodynamics
 - fluid mechanics
 - fluid power
 - electrical fundamentals
- current options and trends in software, including manufacturing process simulation software

Evidence Guide

The evidence guide provides advice on assessment and must be read in conjunction with the performance criteria, required skills and knowledge, range statement and the Assessment Guidelines for the Training Package.

Overview of assessment	A person who demonstrates competency in this unit must be able to undertake investigation of an engineering task to determine the manufacturing fundamentals required by the task and integrating them into a task plan and report the plan and any investigations undertaken.
Critical aspects for assessment and evidence required to demonstrate competency in this unit	Assessors must be satisfied that the candidate can competently and consistently: • communicate, cooperate and negotiate with stakeholders to achieve manufacturing integration task • determine task parameters and context and identify and investigate required manufacturing fundamentals • identify relevant WHS, regulatory requirements, risk management and organisational procedures • integrate manufacturing fundamentals to achieve task objectives • report and document results.
Context of and specific resources for assessment	• This unit may be assessed on the job, off the job or a combination of both on and off the job. Where assessment occurs off the job, then a simulated working environment must be used where the range of conditions reflects realistic workplace situations. The competencies covered by this unit would be demonstrated by an individual working alone or as part of a team. • Where applicable, reasonable adjustment must be made to work environments and training situations to accommodate ethnicity, age, gender, demographics and disability. • Access must be provided to appropriate learning and/or assessment support when required. Where applicable, physical resources should include equipment modified for people with disabilities.
Method of assessment	• Assessment must satisfy the endorsed Assessment

	Guidelines of the MEM05 Metal and Engineering Training Package. • Assessment methods must confirm consistency and accuracy of performance (over time and in a range of workplace relevant contexts) together with application of underpinning knowledge. • Assessment methods must be by direct observation of tasks and include questioning on underpinning knowledge to ensure correct interpretation and application. • Assessment may be applied under project-related conditions (real or simulated) and require evidence of process. • Assessment must confirm a reasonable inference that competency is not only able to be satisfied under the particular circumstance, but is able to be transferred to other circumstances. • Assessment may be in conjunction with assessment of other units of competency where required.
Guidance information for assessment	Assessment processes and techniques must be culturally appropriate and appropriate to the language and literacy capacity of the candidate and the work being performed.

Range Statement

The range statement relates to the unit of competency as a whole. It allows for different work environments and situations that may affect performance. Bold italicised wording, if used in the performance criteria, is detailed below. Essential operating conditions that may be present with training and assessment (depending on the work situation, needs of the candidate, accessibility of the item, and local industry and regional contexts) may also be included.

Appropriate licensed technical and professional assistance	Appropriate licensed technical and professional assistance may include: • technical support and advice relating to elements which have intrinsic dangers, such as: • high pressure • energised fluid vessels • high temperatures and heat energy capacity • wiring with high current control voltages above extra low
---	--

	voltage • professional support for technologies, such as: • specialist electric motor drives and controllers • specialist materials, plastics, metal alloys and nano materials • special processes, foundry, alloy welding, heat treatment, sealing and fastening
WHS, regulatory requirements and enterprise procedures	WHS, regulatory requirements and enterprise procedures may include: • WHS Acts and regulations • relevant standards • codes of practice from Australian and overseas engineering and technical associations and societies • risk assessments • registration requirements • safe work practices • state and territory regulatory requirements
Systems thinking	Systems thinking refers to the conduct of engineering work in a manner that demonstrates knowledge of how the interaction of different technical systems on equipment, machinery or structures, as well as the skills and techniques of personnel, combine to perform or support engineering-related operations, processes or projects. It embraces determining or establishing how the function of each technical system or component, as well as the skills and techniques of personnel, effects or potentially may effect, outcomes. Systems should be interpreted broadly within the context of the organisation and depending on the project or operation can include equipment, related facilities, material, software, internal services and personnel, and other organisations in the value chain.
Continuous improvement implementation	Continuous improvement implementation may relate to plant, products, processes, systems or services, including design, development, implementation or manufacture, commissioning, operation or delivery and maintenance. Improvement processes may include techniques, such as: • balanced scorecard • current and future state mapping • measuring performance against benchmarks

	• process improvement, problem solving and decision making • data management, generation, recording, analysing, storing and use of software • training for improvement systems participation • technical training
Constraints and contingencies	Constraints and contingencies may include: • financial • organisation procedural or culture • physical constraints, such as limits to resources, limits to site access or logistical limitations
Sustainability	Sustainability is used to mean the entire sustainable performance of the organisation/plant, including: • meeting all regulatory requirements • conforming to all industry covenants, protocols and best practice guides • minimising ecological and environmental footprint of process, plant and product • maximising economic benefit of process plant and product to the organisation and the community • minimising the negative WHS impact on employees, community and customer
Lean principles	Lean manufacturing uses cost, capacity and responsiveness, quality, reliability and waste minimisation as drivers of the process and measures for process improvement. Lean manufacturing is the response of many organisations to local, regional, national and global market competitiveness.
